Claim.—1. The combination, in a band-mill, of the cast-metal main standard provided at its top with the independent standards 3, projecting vertically therefrom and formed integrally therewith, the vertically-movable boxes mounted on said standards, the upper shaft mounted in said boxes, and the upper wheel arranged upon said shaft between said standards 3, substantially as described.

2. The combination, in a band-mill, with the standard, of the upper shaft mounted in vertically-movable boxes on said standard, the

388,069.

upper wheel secured upon said shaft between said boxes, and the upper guide-frame, 25, projecting from said standard upon opposite sides of said wheel, and the saw-guide secured to said frame at its outer end, substantially as described.

3. The combination of a band-mill, with the standard, of the upper shaft mounted in vertically-movable boxes on said standard, the upper wheel arranged upon said shaft between said boxes, the U-shaped guide-frame 25, mounted in vertical ways upon said standard and extending upon opposite sides of said wheel, and the saw-guide secured upon said frame, substantially as described.

4. The combination, in a band-mill, of the hollow standard, the upper shaft mounted in vertically-movable boxes thereon, the wheel mounted upon said shaft between said boxes, the U-shaped guide-frame 25, mounted in vertical ways upon said standard, the sheaves 29 and 31, arranged within said standard near the upper and lower ends of said way, the shaft 33, arranged in said standard, provided with the spools 35, and the cables 37, secured to said guide-frame, passing over said sheaves and around said spools, substantially as described, and for the purpose set forth.

5. The combination, in a band-mill, with the hollow standards provided with the vertical ways 27, the U-shaped guide-frame mounted in said ways, the sheaves 29 and 31, arranged in said standard near the upper and lower ends of said ways, the shaft 33, mounted in said standard and provided with the spools 35 and 41, the cables 37, secured to said guide-frame, passing over said sheaves and around said spools 35, and the cable 43, wound upon said spool 41 and provided with the counterbalance-weight 45, all substantially as described.

6. The combination, in a band-mill, with the standard, of an arm secured thereto and projecting toward the saw, and provided at its outer end with an inclined groove, a block mounted in said groove and adapted to be adjusted therein, and be thereby moved toward and from the standard, and provided in its outer face with a transverse groove, and a saw-guide, 53, mounted in said transverse groove and adapted to be adjusted therein across the face of said block, substantially as described.

7. The combination, in a band-mill, with the main standard, of the upper shaft mounted in vertically-adjusted boxes thereon, the upper wheel arranged upon said shaft between said boxes, the U-shaped guide-frame 25, adjustably mounted upon said standard and projecting therefrom upon opposite sides of said wheel, and provided at its outer end with an inclined face having a groove therein, a block mounted in said groove and adapted to be adjusted therein, and a saw-guide adjustably mounted upon said block, substantially as described.

8. The combination, in a band-mill, with the hollow standard provided with the independent oppositely-projecting portions 3 3, the vertically-movable boxes mounted in bearings upon said independent portions of the standard, the pivoted levers 13, arranged within said standard and connected with said sliding boxes and projecting through slots in the walls of the standard, the shaft 19, provided with the short arm 17, connected with said levers 13, and also provided with the arm 21, having the weight-receiving box 23 suspended thereon, substantially as described.

9. The combination, in a band-mill, of the lower shaft, bearing-blocks supporting its opposite ends, the lower wheel secured upon said lower shaft between said boxes, suitable frames supporting said boxes, one of said frames being provided with a movable portion through which the saw may be carried in applying it to or removing it from said lower wheel, substantially as described.

10. The combination, in a band-mill, of the lower shaft, boxes supporting the ends thereof, the lower wheel mounted upon said shaft between said boxes, suitable supports for said boxes, one of said supports being provided with a movable portion formed in separate sections, which, when moved, forms an opening in said support through which the saw may be carried in applying it or removing it from said lower wheel.

11. The combination, in a band-mill, of the lower shaft, boxes supporting the ends thereof, the lower wheel mounted upon said shaft between said boxes, the frames 57, supporting said boxes and provided with the legs 59, and the movable blocks 61 in said legs 59, substantially as described, and for the purpose set forth.

12. The combination, in a band-mill, of the lower shaft, boxes supporting the ends thereof, the lower wheel mounted and secured upon said shaft between said boxes, means for simultaneously raising or lowering both of said boxes, and means for independently raising or lowering one of said boxes, and means for horizontally adjusting one of said boxes.

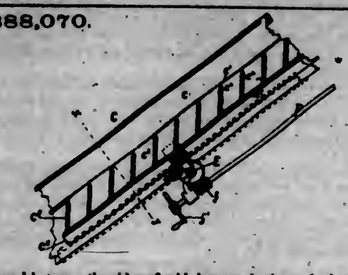
13. The combination, in a band-mill, of the shaft mounted upon the vertically-movable boxes, the revolving nuts engaging threaded rods supporting said boxes, the gear-wheels 75, secured upon said nuts, the shafts 79, provided with pinions engaging said gear-wheels, and provided also with bevel-gears 81, the shaft 83, having the pinion 85, engaging the bevel-gear on one of said shafts 79, the sleeve 87, having a pinion, 89, engaging the bevel-gear 81 on the other of said shafts 79, and the sleeve 91, splined upon the shaft 83 and adapted to engage the sleeve 87 or to be disengaged therefrom, whereby both the said shafts 79 may be simultaneously operated to raise or lower both of said boxes, or one of said shafts may be operated independently of the other, substantially as described.

14. The combination, in a band-mill, with the lower shaft and wheel, of the vertically-movable frames 65 and means for adjusting the same, the boxes 95, mounted upon said frame 65 and adapted to be laterally adjusted thereon, the threaded rod 97, secured to one of said boxes, the threaded worm-wheel 99, engaging said rod, and the shaft 101, for operating said worm-wheel, said rod 97, worm-wheel, and shaft being mounted upon and moving with said frame, substantially as described.

15. The combination, in a band-mill, with the standard having its front and rear sides counterparts of each other, of the upper wheel centrally mounted upon said standard, the lower wheel mounted beneath said upper wheel and the upper and lower guides mounted centrally upon said standard between said upper and lower wheels, substantially as described.

16. The combination, in a band-mill, of the standard having its front and rear sides counterparts of each other, the adjusting and operating devices constructed to be mounted on either side of said standard, the upper wheel mounted centrally upon said standard, the lower wheel arranged beneath said upper wheel, and the upper and lower saw-guides arranged centrally upon said standard between said upper and lower wheels, substantially as described.

17. The combination, in a band-mill, of the standard having its front and rear sides counterparts of each other, the upper wheel centrally mounted upon said standard, the lower wheel arranged beneath said upper wheel, the upper and lower guide-supports arranged centrally upon said standard between said upper and lower wheels, and the reversible guides mounted on said supports, substantially as described.

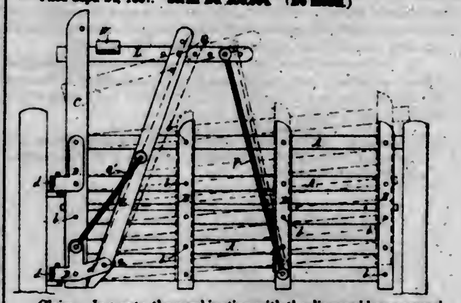


388,070. DUST-TRUNK FOR COTTON-OPENERS. HAVEN C. PERHAM, Lowell, Mass. Filed Jan. 28, 1888. Serial No. 262,194. (No model.)

Brief.—The dust-trunk has a bottom common to all the pockets, said bottom being supported by arms attached to transverse shafts actuated by worm-and-pinion gearing. The sides of the trunk are extended downward, so as to form with the said bottom an inclined chute when said bottom is lowered. The dust-pockets can thus be emptied without stopping the opener.

Claim.—1. A dust-trunk for cleaning fibers, provided with a grating and with a fiber-passage above said grating, and with dust-pockets arranged below said grating, and with a bottom common to all said pockets, normally closing the bottoms of said pockets and arranged between the sides of said dust-trunk and above the lower edges of said sides, and adapted to be lowered away from the lower ends of said pockets and to form with the sides of said trunk a dust-passage for the contents of all said pockets, as and for the purpose specified.

2. An inclined dust-trunk for cleaning fibers, provided with a grating and with a fiber-passage above said grating, and with dust-pockets arranged below said grating, and with a bottom common to all said pockets, normally closing the bottoms of said pockets and arranged between the sides of said dust-trunk above the lower edges of said sides, and adapted to be lowered away from the lower ends of said pockets, and to form with said sides an inclined dust passage or chute down which the contents of said pockets may be forced by their own gravity and discharged at the lower end of said chute, as and for the purpose specified.



388,070.

3. A dust-trunk for cleaning fibers, provided with a grating and with a fiber-passage above said grating, with dust-pockets arranged below said grating, and with a bottom common to all said pockets arranged between the sides of said trunk, in combination with means, substantially as described, of holding said bottom against the lower ends of said pockets, or, at will, of drawing said bottom away from the lower ends of said pockets to empty said pockets and to cause said bottom to form with the sides of said trunk a dust-passage for the contents of said pockets, as and for the purpose specified.

4. A dust-trunk for cleaning fibers, provided with a grating, with a fiber-passage above said grating, with dust-pockets arranged below said grating, and with a bottom common to all said pockets and arranged between the sides of said trunk above the lower edges of said sides, transverse shafts supported below said trunk and provided with arms pivoted to said bottom, a worm-gear secured on each of said shafts, and a longitudinal shaft provided with worms engaging said worm-gears, whereby the turning of said worm-shaft will cause said bottom to close all of said pockets, or, at will, will move said bottom away from the lower ends of said pockets, as and for the purpose specified.

388,071. FARM-GATE. DAVID W. PETTINGTON, Denver, Pa. Filed Sept. 24, 1887. Serial No. 250,564. (No model.)

Claim.—In a gate, the combination, with the diagonal bars secured to the bottom of the rear battens, and the tension members connecting said bars and battens, of the weighted lever pivoted to the upper ends of the diagonal bars, and the supporting-rods connecting the said lever and the forward part of the gate, substantially as and for the purpose specified.

388,072. CABLE RAILWAY. EDWARD C. PHILLIPS, Garden City, Kans., assignor to the Phillips Recessional Cable Grip Construction Company, Chicago, Ill. Filed Oct. 15, 1887. Serial No. 252,262. (No model.)

Claim.—1. A conduit having its side longitudinally slotted and provided with a flange above said slot for greater protection against the entry of foreign matter, substantially as set forth.

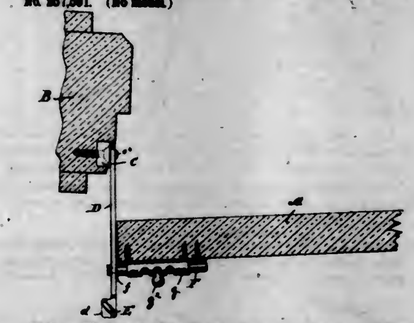
2. A movable roller for the cable to rest on when running freely.

in combination with fixed shoulders and a pivoted clamping-piece for gripping the rope, a slide to which both said roller and said pivoted piece are attached, and mechanism for raising and lowering said slide, for the purposes set forth.

3. A vertically-movable slide and mechanism for operating it, in combination with a clamping device and a lifting device, both attached to said slide, a cable running in the interval between said devices, and fixed shoulders arranged below said cable, substantially as and for the purpose set forth.

4. A hand-lever, a longitudinally-movable rod jointed thereto, a shaft having at one end an arm jointed to said rod and at the other a disk and wrist-pin, a slide engaging with said wrist-pin and raised and lowered thereby, a clamping-piece and roller on said slide, and a pair of fixed shoulders arranged to assist said clamping-piece in gripping a cable, substantially as set forth.

388,073. TRACK DEVICE FOR HANDLING CARS. Ephraim Pierpoint, Clintonville, Ill. Filed Nov. 14, 1887. Serial No. 255,144. (No model.)



Claim.—1. The combination of the unobstructed rails of a main line with the rails of a secondary line, one of which latter abuts against and the other for a distance runs parallel with one of the main-line rails, and both higher than but neither crossing the main-line rails.

2. The combination of the unobstructed rails of a main line with the rails of a secondary line, one of which latter abuts against and the other for a distance runs parallel with one of the main-line rails, and both higher than the main-line rails, and the short and elevated rail between and abutting against neither of the main-line rails and parallel with said secondary rail which abuts against the main rail.

3. The combination of the rails of a main line with the elevated rails of a secondary line, one of them lying for a considerable distance parallel with and near to one rail of the main line, and a plate which lies on the inside of the other rail of the main line.

388,074. DOOR-CHECK. Dennis A. Reardon, South Boston, and Charles A. Gardner, Hyde Park, Mass. Filed Dec. 12, 1887. Serial No. 257,991. (No model.)

Claim.—The furcated bar D, provided at its outer end with thumb-screw E and at its inner end pivoted to a block or plate, C, in combination with a bolt provided near its outer end with a recess or groove, substantially as and for the purposes set forth.

388,075. BUTTON-HOLE TAB. Sallie A. Sarber, Allentown Pa. Filed Apr. 26, 1888. Serial No. 272,160. (No model.)

Claim.—1. As a new article of manufacture, a button-hole tab comprising a sheathing of smooth fabric having a scallop in its upper end for engaging the shank of the button on its lower side, an elastic cord, E, secured by a cord, T, to form a loop, the whole located within said sheathing and its free end extending normally into said scallop and adapted to engage said shank upon its upper side, and a line of stitches, *c*, passing through the two thicknesses of said sheathing and extending within said loop from the cord T to the lower edge of said scallop, as and for the use and purpose described.

2. The elastic loop E, in combination with the folded sheathing composed of a smooth fabric, the cover upon the exterior of said sheathing, both said jackets being provided with a scallop in their upper folded ends, two sets of button-hole stitches, *a*, uniting the sheathing and cover around the edge of said scallop, one set on either side of the interior space, a line of stitching, L, at each side uniting the four edges of sheathing and cover, and a line of stitches, *c*, passing through the four thicknesses and extending longitudinally within said loop from its inner end to the bottom of the scallop, the whole arranged and adapted for use substantially as described.

3. As a new article of manufacture, the herein-described button-hole tab, the same comprising the sheathing O, the elastic loop E therein, the lower ends, E', of said loop being connected by a cord, T, and extending from said point of connection laterally outward, and the stitches *c'*, securing said ends within said sheathing, in combination with a cover upon the exterior of said sheathing and secured thereto by side stitches, L, said tab having an ordinary button-hole, H, extending through the four thicknesses of sheathing and cover and located below and in line with the loop E, and a line of stitches, *c*, passing through the four thicknesses of said sheathing and cover and extending longitudinally within said loop from the cord T to the upper end of the tab, as and for the use and purpose set forth.

388,076. EXTENSION-LEG FOR WATER-CLOSET SEATS AND OTHER SEATS. Charles B. Sumner, Baltimore, Md., assignor to Henry Mollenus & Co., same place. Filed Aug. 6, 1887. Serial No. 246,468. (No model.)

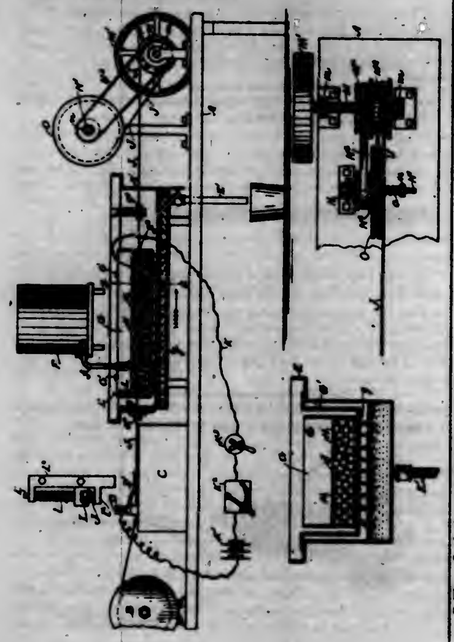
Claim.—In an extensible leg, a perforated standard having flanges on its sides and provided with projecting steps, the tops of which are inclined, while their bottoms are substantially horizontal, in combination with a bolt and nut and a slotted and serrated foot-section having flanges on its sides and steps the reverse of those on the standard and registering therewith, all constructed substantially as described, whereby the nut is prevented from turning by the flanges on the foot-section, and the foot-section is prevented from turning by the flanges on the standard, substantially as set forth.

388,077. CHECK-ROW ATTACHMENT. Levi Sowles, Grand Haven, Mich. Filed Mar. 7, 1888. Serial No. 266,494. (No model.)

Claim.—1. In a corn-planter and in combination with the crank and its actuating devices, the lever interposed between said crank and the slide controlling the feeding device, said bar being supported upon a pivot in line with but transverse to the axis of the crank, and provided with a slotted or furcated end projected across the face of the crank disk or wheel, substantially as described.

2. In a check-row attachment such as described, the combination, with the shaft C and centrally-arranged gears and crank, of the lever slotted or furcated for the reception of the crank-pin, and supported upon a transverse pivot in line with the axis of the crank but below the latter, said lever being also provided with a transverse pin or bearing projected between the cheeks or bearings on the slide-bar, substantially as described.

3. In a check-row attachment such as described, the combination, with the crank and actuating devices for intermittingly rotating the former, of a lever pivotally attached to the bracket supporting the crank on a center in line with and transverse to the axis of the crank, said lever being provided on one end with a furcated portion projected across the face of the crank and embracing the crank-pin, and at the other with a transverse pin for engaging steps on the slide-bar, substantially as described.



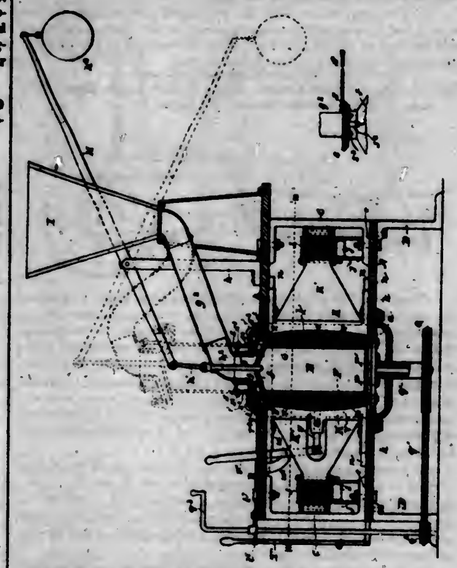
4. In a check-row attachment such as described, the combination, with the bracket secured to the cross-bar A and supporting the crank above said bar, of the lever pivotally attached to said bracket beneath the bar A and provided with two arms, the one carrying the pin for operating the feeding devices depending beneath the supporting-bar A, and the other extending across said bar A and provided with a furcated or slotted portion engaging the crank-pin, substantially as described.

5. In a check-row attachment wherein the operating-crank is arranged and supported at or near the middle of the cross-bar A, and is driven from a shaft, C, through gears, substantially as described, the combination, with said crank and the actuating devices therefor, of the lever I, pivoted beneath the bar A in line with the axis of the crank, and provided with the furcated end 3, for the reception of the crank-pin, and the pin or stud 4, for engaging the steps 11 on the slide-bar, as and for the purpose set forth.

6. The improved sectional steps or bearings 11, for application to the slide-bar B, constructed, substantially as described, in two sections, one formed with the recess therein and the other with the wings or flanges for entering said recess on either side of the bolt, and both provided with the depending flanges grooved for the reception of the edges of the bar B, and a clamping-bolt engaging the sections to draw them together and clamp their flanges upon the bar B, substantially as described.

7. The improved adjustable and removable steps 11, formed in two sections, each provided with flanges or grooved portions fitting the edges of the bar B, and interlocking projections, one of said sections carrying the bearing or step-pin and provided with an extended bearing on the top of bar B, in rear of said step-pin, and a bolt engaging both sections to hold them together and clamp them upon the bar B, substantially as described.

388,078. MACHINE FOR TEMPERING METAL WIRES AND STRIPS. Freemont Smedley, Chicago, Ill. Filed Jan. 19, 1888. Serial No. 261,513. (No model.)



Claim.—1. The combination, with a machine for tempering metal wires and strips, of a feed mechanism consisting of a feed-pulley upon which the wire is first trained, with means, as a shaft and pulley, for driving the same at a uniform rate of speed, and a receiving-spool journaled upon a frictional bearing upon a shaft or spindle adjusted to rotate at a higher rate of speed than that of the feed-pulley, whereby the spool may be revolved at a greater or less speed in proportion as the coil is wound thereon, substantially as shown and described.

2. In a machine for tempering metal wires and strips, the combination of means, as an electric current, for heating the wire, means, as a cooling-bath, for chilling the same, a feed-pulley for drawing the strip through the tempering apparatus at a uniform rate of speed, and a receiving-spool journaled by means of a frictional bearing upon a spindle, with means for normally rotating said spindle at a higher rate of speed than that of the feed-pulley, substantially as shown and described.

3. In a machine for tempering metal wires and strips, the combination of means, as an electric current, for heating the wire, means, as a cooling-bath, for chilling the same, a feed-pulley, M', means, as a shaft, M, and pulley M', for rotating said feed-pulley, spindle N', means, as a pulley, N', and belt N', for normally rotating said spindle at a higher rate of speed than the shaft M, and a receiving-spool secured to said spindle by means of a frictional bearing for winding said strip as it is drawn through the machine, substantially as shown and described.

4. In a machine for tempering metal wires and strips, the combination of means, as an electric current, for heating the wire, means, as a cooling-bath, for chilling the same, a feed-pulley, M', means, as a shaft, M, and pulley M', for rotating said feed-pulley, spindle N', means, as a pulley, N', and belt N', for normally rotating said spindle at a higher rate of speed than the shaft M, and a receiving-spool loosely mounted upon said spindle, and means, as a nut and spring, for regulating the tension of the wire or strip to be wound thereon by increasing or decreasing the friction, substantially as shown and described.

388,079. MACHINE FOR BULGING PAPER BARRELS. John F. Shedlin, Akron, Ohio. Filed May 18, 1887. Serial No. 238,470. (No model.)

Claim.—1. In a paper-barrel machine, the combination, with the outer staves thereof provided with curved feet or extensions and with their actuating mechanism, of guideways for said feet, substantially as described.

2. The combination, with the outer movable staves provided with the extensions or feet, of the guide-plates having the curved ways in which said feet move, substantially as and for the purpose described.

3. A series of outer movable staves, in combination with face-plates secured thereto having beveled edges which interlock one with another, substantially as specified.

4. The combination of the outer stave having the tubular socket,

the pin or plug for forming the bung-hole, and means for operating said pin, substantially as set forth.

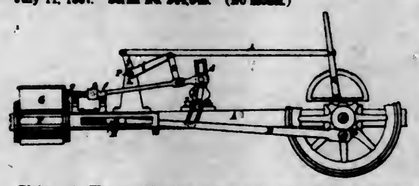
5. The combination, with the inner staves provided with the guide-pins and operating-pins, of the stationary plate provided with slots for receiving and guiding said guide-pins, a rotary plate provided with slots for receiving said operating-pins, and means, substantially as described, for operating said rotary plate, as and for the purpose described.

6. The combination, with the inner series of staves having the guide-pins g g^3 and the rollers thereon, of the oscillating scroll-plate with its two scroll-slots p p, and the stationary plate with its oblique and radial slots p', and pins projecting through said slots, substantially as and for the purpose described.

7. The combination, with the two contiguous inner staves and their divided pin, of the slotted scroll-plate and means, substantially as described, for operating said scroll-plate, as and for the purpose set forth.

8. The combination, with the adjustable hollow cover, of the ring-gate located on and movable relative to said cover, means for operating said gate, and means, substantially as described, for raising and lowering said hollow cover, as and for the purpose specified.

9. The combination, with the hollow cover having the central inlet, of the tank or reservoir, the flexible pipe connecting said tank and cover, the ring-gate and its operating mechanism, and a [illegible] mechanism connected to the cover, substantially as set forth.



10. The hollow cover or top having the central inlet-aperture and provided with the bevel-wheel placed around the neck of said opening, in combination with the ring-gate and interposed mechanism for operating the same, substantially as set forth.

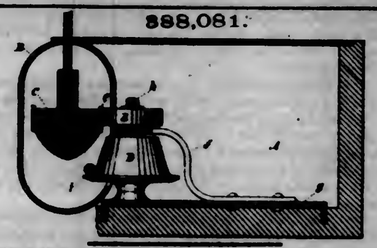
11. The combination, with the hollow cover having the central inlet and its surrounding beveled gear-wheel, of the ring-gate and the vibrating crank-arms connected to said gate at one end and provided with toothed segments meshing with the gear-wheel, substantially as and for the purpose specified.

12. The combination, with the top plate and the hollow cover, of the locking-bolts, the pivoted levers for operating said bolts, the connecting-link for actuating said levers, and the vertical lever for operating said link, substantially as described.

13. The combination, with the perforated plate secured to the stave K and formed with a recess or groove, of the gauze or pervious covering secured to said plate and having its edge lying in said groove, substantially as and for the purpose described.

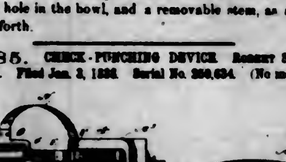
388,080. VALVE-GEAR. HENRY F. SHAW, Boston, Mass. Filed July 11, 1887. Serial No. 244,065. (No model.)

Claim.—1. The combination of two eccentrics, K and L, fixed on the same axle or shaft, the center of one, K, of the eccentrics being in substantially the same radial direction from the center of the axle or shaft as the crank-pin, and the eccentrics being set quartering, or approximately so, with reference to each other, a lever, H, pivoted on the frame of the engine and connected with the eccentric K by means of a rod, M, a link, I, pivoted to said lever H, and means, substantially as the lever J, fixed to said link, whereby the link is connected with the other eccentric by means of a rod, N, substantially as and for the purposes set forth.



2. In combination with a crank-pin, c, and two eccentrics, K and L, fixed on an axle or shaft, as specified, two rods, M and N, a lever, H, pivoted on the frame of the engine, a reversing-link, I, pivoted to the lever H, an arm or lever, J, fixed to said link, a block, d, to slide on said link, a rod, O, and valve-stem g, substantially as and for the purposes set forth.

3. In combination with an eccentric, K, fixed on an engine shaft or axle, C, a rod, M, a lever, H, pivoted on the frame of the engine, and a reversing-link, I, pivoted to the lever H and connected with the slide-valve for operating the same and admitting steam to the cylinder, substantially as specified.

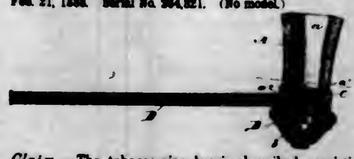


388,081. CABLE RAILWAY. ABRAHAM A. SIBLEY and WILLIAM BEMLEY, Jerseyville, Ill. Filed Dec. 27, 1887. Serial No. 259,157. (No model.)

Claim.—In a cable railway, the combination of a conical cable-carrier with an anti-friction roller, the latter adapted to impinge upon the side of the grip-jaw, both being journaled upon the same stud or spindle, as set forth.

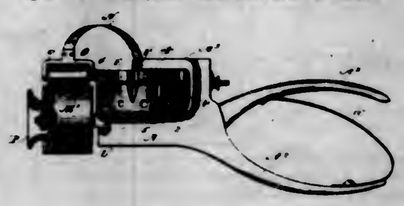
388,081.

388,082. APPARATUS FOR PAINTING SHINGLES. LOUIS SIEBERT, Chicago, Ill. Filed May 1, 1888. Serial No. 272,262. (No model.)



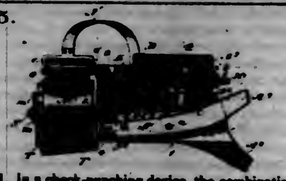
Claim.—An apparatus for the purpose described, consisting of a box, A, for holding paint in bulk, and provided at its side with an inclined brush, B, having guard-plate b, having an opening at its bottom, and a brush, C, placed horizontally above brush B, all substantially as set forth.

388,083. LIFTER FOR CUSPIDORS AND THE LIKE. WILLIAM H. SMITH, Danbury, Conn. Filed Nov. 2, 1887. Serial No. 254,094. (No model.)



Claim.—The combination, with the spring-connected legs, of the hooks projecting from the ends of said legs, the points of said hooks extended outward beyond the plane of the legs, and the heels of said hooks extended inward beyond the plane of the legs, substantially as specified.

388,084. TOBACCO-PIPE. HANS J. SÖRENSEN, Chicago, Ill. Filed Feb. 21, 1888. Serial No. 264,821. (No model.)



Claim.—The tobacco-pipe herein described, consisting of the tubular bowl provided near its lower end with a lateral opening for the stem, the removable drip-cup attached to the bowl by means of a tongue-and-groove connection and having an internal tubular part extending into the bowl and provided with lateral holes which register with the hole in the bowl, and a removable stem, as and for the purpose set forth.

388,085. CHECK-PUNCHING DEVICE. ROBERT SPENCER, Chicago, Ill. Filed Jan. 3, 1888. Serial No. 259,634. (No model.)

388,085.

Claim.—1. In a check-punching device, the combination of pivoted jaws, handles for operating said jaws, a rotary die-carrier and die-plate sustained by one of said jaws, a series of movable dies within said die-carrier, and a movable die-operating block or plunger, substantially as described.

2. In a check-punching device, the combination, with pivoted jaws and handles for operating said jaws, of a rotary die-plate and a die-carrier provided with dies, said carrier being sustained by and outside of said jaws, and one of said jaws being extended across the rear ends of the dies, substantially as described.

3. In a check-punching device, the combination, with pivoted jaws and handles for operating said jaws, of a rotary die-plate and a die-carrier provided with open-ended chambers and dies held within said chambers, said die-carrier being mounted upon and outside of said jaws, and one of said jaws being extended beneath the rear ends of said dies, substantially as described.

4. In a check-punching device, the combination of a rotary die-carrier and die-plate and pivoted jaws, one of said jaws being provided with a standard for sustaining the die-carrier and die-plate, substantially as described.

5. In a check-punching device, the combination of a rotary die-plate, a die-carrier connected with said plate, pivoted jaws, one of which is provided with a base-plate whereon the die-carrier rests, and with a standard for holding the die-carrier in proper position, and a series of dies movably held with said die-carrier, substantially as described.

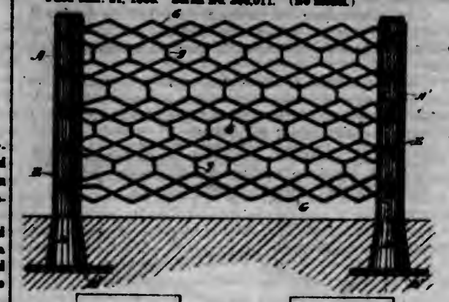
6. In a check-punching device, the combination of a rotary die-carrier having a series of chambers formed therein, a die-plate fixed upon the hub of said die-carrier, a series of movable dies provided with lugs and held within said die-carrier, and a guard-plate for checking the movement of said dies, said guard being located between said lugs and the die-plate to restrict the movement of the dies toward the die-plate, substantially as described.

7. In a check-punching device, the combination of a rotary die-carrier having a series of chambers, a series of punches mounted within said chambers, and a fixed guard-plate having a single slot therein to release the dies, substantially as described.

8. In a check-punching device, the combination, with the pivoted jaws and handles for operating said jaws, of a die-plate, a die-carrier provided with a series of movable dies, a fixed guard-plate slotted to release said dies, and a die-operating block or plunger having a retracting-hook for entering the slot of the guard-plate and withdrawing said dies from the die-plate, substantially as described.

9. In a check-punching device, the combination of a rotary die-carrier and die-plate, pivoted jaws, one of said jaws being provided with a standard for sustaining the die-carrier and die-plate, and a gage held within the space between the die-carrier and die-plate and having a shank projecting through said standard, substantially as described.

10. In a check-punching device, the combination of a rotary die-carrier and die-plate, pivoted jaws, one of said jaws being provided with a standard for sustaining the die-carrier and die-plate, a gage provided with a screw-threaded shank extending through said standard, and an adjusting-nut for determining the position of said gage, substantially as described.

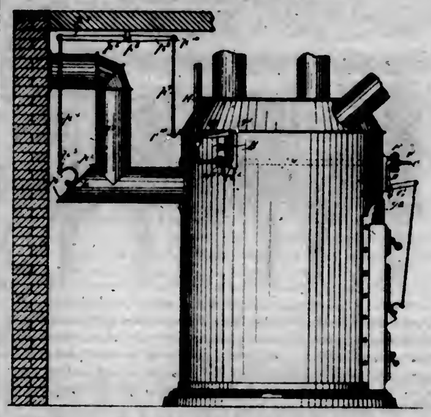


11. In a check-punching device, the combination, with the jaws of the punch and a rotary die-carrier and die-plate held thereby, of feed-rollers and a sustaining-frame detachably connected with the jaws, substantially as described.

12. In a check-punching device, the combination, with a rotary die-carrier and die-plate, of feed mechanism comprising a sustaining-frame, a shaft projecting from said frame, a lower roller journaled upon said shaft, a spring-bar extending from said frame, and an upper feed-roller carried by said spring-bar, substantially as described.

13. In a check-punching device, the combination, with the die-carrier and die-plate, of two feed-rollers, the lower roller being provided with a pawl and the axle of said lower roller being provided with a ratchet, substantially as described.

14. In a check-punching device, the combination, with the jaws of the punch, handles for operating said jaws, and a rotary die-carrier and die-plate held by said jaws, of two feed-rollers, one of said rollers being provided with a head-plate at its outer end, an axle for sustaining said roller projecting from the front end of the punch, and a pawl and notched wheel for said roller, substantially as described.



388,086. FENCE-POST. RANSOM B. BROOKS, Clifton Springs, N. Y. Filed Mar. 21, 1888. Serial No. 268,011. (No model.)

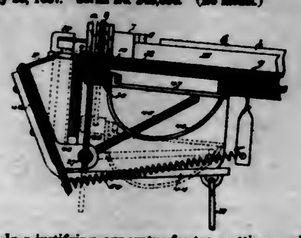
Claim.—As a new article of manufacture, the hollow fence-post A, whose rear face is open and whose base B is conical, terminating in a base-plate, B', the said post having a series of transverse slots, D, and adapted to hold the wires by means of the links K, and the wedges F, concaved at f' and perforated at f^2, for the purpose and in the manner specified.

388,087. AUTOMATIC REGULATOR FOR FURNACES AND STOVES. EDWARD G. STEVENS and ABBOTT B. STEVENS, Clinton, Mass., assignors to the Ridgway Furnace and Stove Company, Nashua, N. H. Filed Jan. 30, 1888. Serial No. 262,704. (No model.)

Claim.—1. The combination, in a furnace-regulator, of a metal tube expansible under heat, an inclosed tube of less expansible metal, a plate, B, against which the outer tube bears, a lever, D, having the hole e and recess e^2, the dial E, having the studs or legs e', and the indicator-nut F, which screws upon the end of the inner tube and locks it against the lever D, substantially as described.

2. The combination, in an automatic regulator for furnaces and stoves, of the metal tube A, expansible under heat and connected at each end with a plate supporting a lever, D, substantially as set forth, the said plate, a tube inclosed within said expansible tube, the ends of which extend without the furnace, and nuts mounted upon or having standards or legs connecting said ends with the said levers D, all substantially as described.

3. The combination, in a furnace-regulator, of the expansible tube A, the plate B, having the hole a^3, the recess a, and shoulder a', the non-expansible inner tube extending through the hole a^3, the lever D, pivoted to said plate, as described, and having a hole, d, the lever G, operated by the lever D, as specified, the dial E, mounted upon the standards or posts e', the ends of which enter the holes, or recesses e^2 of the lever D, and the indicator-nut F, which screws upon the end of the inner tube, substantially as described.



4. The combination, in a furnace-regulator, of the lever D, having the recess e^2, the tubes A C, connected with each other as speci-

fied, the dial E, having the lugs d', and the indicator-nut F, all substantially as described.

5. The combination, with the tubes A and C, of the dial-disk E, having the sleeve e', the indicator-nut F, having the sleeve f', and the balls interposed between the said disk and nut, substantially as set forth.

6. The combination, in an automatic regulator for furnaces and stoves, of the expansible tube A, the tube C, inclosed within the expansible tube, and the pipe H, for connecting the inclosed tube C with the outer air, all substantially as described.

388,088. JUSTIFYING APPARATUS. JOSEPH THORNE, Port Richmond, N. Y., assignor to the Thorne Machine Company, of New York. Filed July 23, 1887. Serial No. 245,008. (No model.)

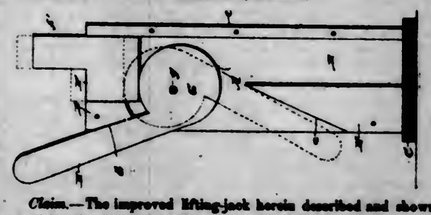
Claim.—In a justifying apparatus for type-setting machines, the combination, with the galley and its support having the raised slotted head 10, of the fence and bridge plate 8, moving vertically in the slot in said head and arranged to be moved downward flush with the upper surface of the head to admit the type to the galley and upward so as to project above the head to support the line of type, the vibrating packer P, and connections between the packer and the bridge and fence plate, whereby the plate is moved downward as the packer is moved inward, and vice versa, substantially as described.

388,089. WASH-TUB. FRANCIS J. THERASON and FRANK A. WELLS, Allegheny, Pa. Filed Jan. 26, 1887. Serial No. 225,514. (No model.)

Claim.—1. In combination with the wash-tray, the top frame resting upon its upper edge and the bolts E', passed through the top frame and suitably stopped by a head above said frame, and terminating at the lower end in a hook which is integral with the bolt and which reaches underneath the tray, and a clamping-nut on each bolt, whereby the tray may be bound between the top frame and the hook end of the bolt, substantially as set forth.

2. In combination, the wash-trays successively adjacent, a continuous top frame overlapping their adjacent edges, clamping-anchors independent of the supports and of each other underlapping the lower adjacent edges of the trays, the clamping bolts passing between the trays and connecting the top frame with the clamping-anchors, respectively, and provided with clamping-nuts, substantially as and for the purpose set forth.

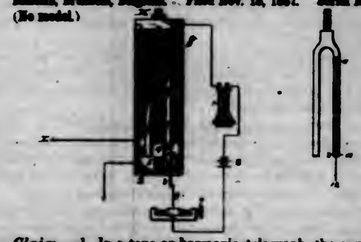
3. In combination, substantially as hereinabove set forth, the wash-trays arranged successively adjacent, the three-legged stools arranged one underneath and adapted to support independently each tray, a continuous top frame overlapping the adjacent edges of the trays, the clamping-anchors lapping said trays underneath and extending between the said triangular frames, and the clamping-bolts connecting the frame with the said anchors and provided with the clamping-nuts.



4. In combination with the wash-trays successively adjacent, top frame lapping over the adjacent edges, bolts passing through the top frame down between the trays, and the clamping-washers F^{10}, having apertures for the bolts large enough to allow the latter lateral play thereof, and the clamping-nuts below such washers, substantially as set forth.

5. In combination with the trays successively adjacent, the top frame lapping over the adjacent edges, the bolts passing through the top frame between the trays, and the clamping-washers loosely fitted on the lower ends of the bolts, and which are bent upward near their ends, substantially as set forth.

6. In combination with the wash-trays successively adjacent, a continuous top frame overlapping their adjacent edges and extending beyond their margins, respectively, at their opposite ends, clamping-anchors independent of the supports and of each other underlapping the lower adjacent edges of the trays, the clamping-bolts between the trays connecting the top frame with the clamping-anchors, respectively, and provided with clamping-nuts, and the bolts E', passed through the top frame beyond said opposite ends of the trays and stopped by suitable head above the frame and terminating at the lower end in a hook which reaches underneath the tray, and a clamping-nut on each bolt to bind the tray between the top frame and the hook end of the bolt, whereby the end bolts, E', co-operate with the intermediate bolts to bind the whole length of the top frame closely upon all the trays, substantially as set forth.



7. In combination with the wash-trays successively adjacent, the separate stools upon which the trays respectively rest, having each their legs connected at the top by bars forming a supporting-surface for the trays, respectively, the top frame continuous and overlapping the adjacent edges of the trays and projecting beyond their extreme edges, the clamping-anchors independent of the supporting-stools and of each other underlapping the lower adjacent edges of the trays between the stools, the clamping-bolts between the trays connecting the top frame to the clamping-anchors and provided with suitable clamping-nuts, and the clamping-bolts E' beyond the extreme ends of the trays passed through the projecting margin of the top frame and suitably stopped by head above the same, and having the lower end formed into a hook which reaches underneath the tray, and a clamping-nut on each of said bolts to bind the tray between the top frame and the hooked end of the bolt, whereby the intermediate bolts and their anchors co-operate with the end bolts and their hooks to bind the top frame closely upon the top of the trays throughout the whole length without extending a clamp across the bottom of the tray, where it rests upon the stool, substantially as set forth.

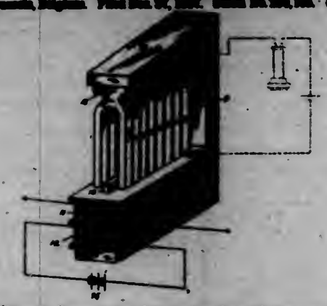
388,090. LIFTING-JACK. WILLIAM TURNER, Dunbarton, Mo. Filed Apr. 26, 1888. Serial No. 271,992. (No model.)

Claim.—The improved lifting-jack herein described and shown, comprising the side plates, B B, the base-block C, connecting the lower ends of the same, the vertical strip c, connecting the rear edges of the plates and closing the space between the same, the block D at the upper front corners of the plates B B, having a downwardly and inwardly inclined lower edge, d, the block E at the lower front corners of said plates, having an inwardly and upwardly inclined upper edge, e, the lifting-block F, sliding between the block D and the strip c, and the eccentric-block pivoted between the side plates below the lifting-block and the block D, and having a lever-handle projecting outwardly between the inclined edges of the blocks D and E, as specified.

388,091. HARMONIC TELEGRAPHY. FRANÇOIS VAN EYSBERMEN, Brussels, Belgium. Filed Nov. 15, 1887. Serial No. 255,393. (No model.)

Claim.—1. In a tone or harmonic telegraph, the combination, with a tuning-fork operated by the main-line currents, of an extension on said fork, a local circuit controlled by the extension, and a telephone in said local circuit, substantially as described.

2. In a tone or harmonic telegraph, the combination, with a tuning-fork controlled by the main-line currents, of an extension on said fork, an adjustable contact-pin in a local circuit, and a telephone also in the local circuit, substantially as described.



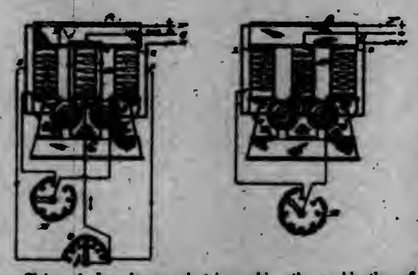
3. The combination, with a tuning-fork, of an extension attached to the fork and tuned in harmony with the fork, substantially as described.

4. The combination, with a tuning-fork, of an extension attached to the fork and tuned in harmony therewith and an adjustable contact-piece included in a local circuit also tuned in harmony with the fork, substantially as described.

5. The combination, with a tuning-fork, of an extension one end of which is attached to the fork, and pins between which the free portion of the finger vibrates, the finger being tuned in harmony with the fork and the pins arranged with relation to the nodal points of the finger, substantially as set forth.

6. The combination, with a magnetized tuning-fork, of an extension attached thereto and tuned in harmony therewith, a local circuit including the extension, an adjustable contact controlling said local circuit and operated by the extension, and a telephone in said circuit, the arrangement being such that the local circuit will be varied only when the fork vibrates to its full amplitude, substantially in the manner and for the purposes set forth.

388,092. TELEGRAPH-RECEIVER. FRANÇOIS VAN EYSBERMEN, Brussels, Belgium. Filed Nov. 27, 1887. Serial No. 256,164. (No model.)



Claim.—1. In a tone or harmonic telegraph, a receiving-instrument consisting of a bent metallic frame having upon one end an extended core-piece, a main-line coil surrounding said core-piece, and a series of tuning-forks having varying fundamental rates of vibration, arranged upon the other end of the frame and extending into proximity with the core-piece, substantially as described.

2. In a tone or harmonic telegraph, a receiving-instrument having a single electro-magnet and core therefor, and a series of tuning-forks arranged to be operated by said magnet, and a local battery and coil connected therewith surrounding said core, substantially as described.

3. In a tone or harmonic telegraph, a receiving-instrument consisting of a bent magnetized frame, a series of forks secured to and constituting one pole of the frame, and a core-piece secured to and constituting the other pole of the frame and controlling all the forks, substantially as described.

388,093. DYNAMO-ELECTRIC MACHINE. MONTGOMERY WARD, New York, N. Y. Filed Feb. 27, 1888. Serial No. 265,591. (No model.)

Claim.—1. In a dynamo-electric machine, the combination of a field-magnet, two armatures between the poles of said magnet, and a central regulating-pole between the armatures, substantially as set forth.

2. In a dynamo-electric machine, the combination of a field-magnet, two armatures between the poles of said magnet, a central magnet between the armatures, and means for reversing the magnetism of said central magnet, substantially as set forth.

3. In a dynamo-electric machine, the combination of a field-magnet, two armatures between the poles of said magnet, a central magnet between the armatures, and means for varying and reversing the magnetism of said central magnet, substantially as set forth.

4. In a dynamo-electric machine, the combination of a field-magnet, two armatures between the poles of said magnet, a central magnet between the armatures, and means for varying and reversing the magnetism of said central magnet, substantially as set forth.

5. In a dynamo-electric machine, the combination of a field-magnet, two armatures between the poles of said magnet, the same being electrically connected in series, and a regulating-pole between the armatures, substantially as set forth.

6. The combination of a field-magnet, two armatures connected in series between the poles of said magnet, two main conductors extending from opposite terminals of the series, a compensating conductor extending from the conductor joining the armatures, and a central regulating-pole between the armatures, substantially as set forth.

7. The combination of a field-magnet, two armatures connected in series between the poles of said magnet, two main conductors extending from opposite terminals of the series, a compensating conductor extending from the conductor joining the armatures, and a central regulating-magnet between the armatures, provided with means for varying and reversing its magnetism, substantially as set forth.

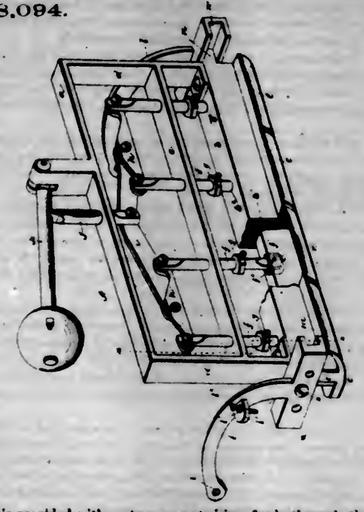
8. The combination of a field-magnet, two armatures connected in series between the poles of said magnet, two main conductors extending from opposite terminals of the series, a compensating conductor extending from the conductor joining the armatures, and a central magnet between the armatures, having coils included in said compensating conductor, substantially as set forth.

9. The combination of a field-magnet, two armatures connected in series between the poles of said magnet, two main conductors extending from opposite terminals of the series, a compensating conductor extending from the conductor joining the armatures, a central magnet between the armatures, a shunt between the two main conductors, and a conductor extending from at or near the point of connection of the compensating conductor to a point on said shunt and including coils of said central magnet, substantially as set forth.

10. The combination of a field-magnet, two armatures connected in series between the poles of said magnets, two main conductors extending from opposite terminals of the series, a compensating conductor extending from the conductor joining the armatures, a central magnet between the armatures, a shunt between the two main conductors, resistance-coils in said shunt, and a conductor extending from at or near the point of connection of the compensating conductor, including coils of said central magnet, and terminating in an arm adjustable along said resistance-coils, substantially as set forth.

11. The combination of a field-magnet, two armatures connected in series between the poles of said magnet, two main conductors extending from opposite terminals of the series, a compensating conductor extending from the conductor joining the armatures, a central magnet between the armatures, a shunt between the two main conductors, resistance-coils in said shunt, a conductor extending from at or near the point of connection of the compensating conductor, including coils of said central magnet, and terminating in an arm adjustable along said resistance-coils, and coils on said central magnet included in said compensating conductor, substantially as set forth.

388,094. SECTIONAL ADJUSTABLE PRESSURE-BAR AND CHIP-BREAKER FOR WOOD-PLANING MACHINES. CHARLES S. WARNER, Gloversville, N. Y. Filed May 11, 1888. Serial No. 273,842. (No model.)



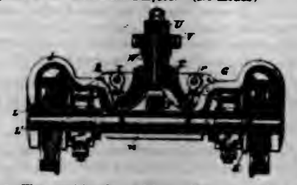
Claim.—1. A pressure-bar for wood-planing machines, comprising a frame, a grooved bottom rail therein, a suitable number of shoes having shanks arranged in said grooved rail, an equalizer composed of two levers, to the ends of which the shoes are flexibly connected, and a third freely-moving lever, to which the said two levers are pivoted, and a counterbalancing device, substantially as described.

2. A frame, A, composed of a top rail, a grooved bottom rail, an intermediate cross-rail, and suitable connections, combined with a series of shoes having shanks arranged in said grooved rail, a three-lever equalizer, and stems flexibly connected to the shoes and to the equalizer, and a counterbalancing device, whereby individual self-adjustment is permitted to each shoe, substantially as described.

3. A frame composed of a top rail and a grooved bottom rail, combined with a series of shoes having shanks fitted loosely in said bottom rail, stems flexibly pivoted to said shanks about midway of their lengths and provided with adjustable detents for limiting the descent of the shoes, a three-lever equalizer loosely arranged in said frame, and to which said stems are flexibly connected, and a counterbalancing device applied to said equalizer, substantially as described.

4. A frame, A, comprising a top rail and a grooved bottom rail, combined with an equalizer composed of the levers A A, the lever i, to the ends of which said first-named levers are pivoted, and which

388,094.



lever *i* is provided with a stem or post rising freely through the top rail of the frame, the equaliser being thus freely suspended within the frame, a counterbalancing device applied to the equaliser stem or post, and shoes arranged in the grooved bottom rail, and stems connected flexibly to the shoes and to the levers *h h*, substantially as described.

5. A pressure-bar for wood-planing machines, composed of a frame having a bottom rail, shoes therein, and an equaliser to which such shoes are connected, combined with pivotal arms or brackets having grooved ways *m*, receiving lugs on the bottom rail, and set-screws for fixing the bottom rail in adjusted position in said ways, to vary the proximity of the pressure-bar to the cutter-head, substantially as described.

6. A pressure-bar for wood-planing machines, composed of a frame having a bottom rail, shoes therein, and an equaliser to which such shoes are connected, combined with pivotal arms or brackets having grooved ways *m*, receiving lugs on the bottom rail, and set-screws for fixing the bottom rail in adjusted position in said ways, to vary the proximity of the pressure-bar to the cutter-head, and set-screws on the sides of the brackets or arms to vary the height of the pressure-bar from the bed of the planing-machine, substantially as described.

388,095. CAR-TRUCK. James H. Wheely, Phillipsburg, N. J. Filed July 26, 1887. Serial No. 245,675. (No model.)

Claim.—1. The combination, with a railway-car axle and wheels, of a metallic safety-frame consisting of arches over the wheels and an intermediate connecting part over the axle, and constructed with supernumerary bearings normally embracing the axle, but out of contact with it, and adapted in case of breakage to fall into contact therewith.

2. The combination, with a railway-truck, of a metallic safety-frame connected thereto, extending transversely thereof over the axle and wheels, and consisting of arches over the wheels and an intermediate connecting part over the axle, constructed in one piece and formed with supernumerary bearings normally embracing the axle, but out of contact with it, and adapted in case of breakage to fall into contact therewith.

3. The combination, with a railway-truck, of a safety-frame fixed thereto, extending transversely thereof over the axle and wheels, and constructed with supernumerary bearings just outside of the wheels, between them and the axle-boxes, normally embracing the axle, but out of contact with it, and adapted in case of breakage to fall into contact therewith.

4. The combination, with a railway-truck, of a safety-frame fixed thereto, extending over the axle and wheels, and constructed with arches over the wheels and an intermediate portion over the axle, and with supernumerary bearings on opposite sides of each of the wheels, said bearings normally embracing the axle, but out of contact with it, and adapted in case of breakage to fall into contact therewith.

5. A safety-frame for railway-trucks, consisting of arches to pass over the wheels, an intermediate connecting portion, and braces connecting with the upper parts of said arches to stiffen the frame.

6. A safety-frame for railway-trucks, consisting of arches over the wheels, an intermediate connecting portion, and forked supernumerary bearings forming downward continuations of the arches, and adapted to embrace the wheels while normally out of contact therewith.

7. The combination, with a railway-truck, of a safety-frame extending transversely thereof over the wheels and axle, and constructed with a channeled portion or hood extending over and partly inclosing the axle, with a strap connected thereto and passing beneath the axle.

8. A car-axle constructed with supernumerary journals outside of the wheels and between them and the usual journals.

9. A car-axle constructed of increased diameter where it passes through the wheels, and with this increased diameter extended to each side of the wheels a distance sufficient to constitute supernumerary journals in addition to the usual journals.

10. The combination, with a railway-truck, of a safety-frame extending over the axle and wheels, constructed with thrust-bearings adapted to limit the lateral movement of the wheels and axle relatively to the truck, thereby relieving the bruises of thrust.

11. The combination, with a railway-truck, of a safety-frame extending over the axle and wheels, constructed with thrust-bearings coming closely adjacent to and laterally facing the wheels, and adapted to limit the lateral play of the latter relatively to the truck, thereby relieving the bruises of thrust.

388,096. CAR-WHEEL. James H. Wheely, Phillipsburg, N. J. Filed Sept. 6, 1887. Serial No. 248,986. (No model.)

Claim.—1. A car-wheel consisting of a wheel-center having a rim with its periphery cylindrical and of uniform diameter from side to side, combined with a tire fitted over said rim, and screws for fastening said tire passed through said rim from opposite sides of the web.

2. A car-wheel constructed of three parts—a wrought-metal hub, a removable tire, and an intervening fully of cast metal welded to said hub and formed with a radially-corrugated web of sinuous contour at its junction with the rim.

3. A car-wheel constructed with a web having an annular hollow or core around its hub, and formed with a radially-corrugated web of sinuous contour having its greatest sinuosity at its junction with the rim, and the corrugations diminishing continuously thence toward the hub.

4. A car-wheel constructed with a radially-corrugated web of sinuous contour at its junction with the rim and with radial ribs projecting to opposite sides of the web, and those on the opposite sides arranged to coincide with one another in planes intersecting the web.

5. A car-wheel constructed with a radially-corrugated web and with radial ribs projecting therefrom at intervals on opposite sides thereof, whereby pockets of varying depth are formed against the rim on both sides of the wheel, with screws passed through the rim in the deeper pockets, and a removable tire fitted to said rim and secured by said screws.

6. A car-wheel consisting of a removable tire, combined with a wheel-center formed of a solid hub of forged or wrought metal and an outer portion or fully of cast metal welded to said hub.

7. A car-wheel constructed with a wheel-center formed of a solid hub of wrought metal having a deep peripheral groove and an outer portion or fully of cast metal cast into said groove and forming a welded joint therewith, whereby the two parts of the wheel-center are united permanently and by a weld of extensive surface.

8. A car-wheel constructed with a wheel-center formed of a solid hub of wrought metal having a deep peripheral groove, the sides of which are undercut, and an outer portion or fully of cast metal cast into said groove, whereby the two parts of the wheel-center are united by means of a dovetailed connection.

9. A car-wheel constructed with a wheel-center formed of a solid hub of wrought metal having projecting flanges on its outer and inner faces forming a deep peripheral groove between them, and an outer portion or fully of cast metal cast into said groove and made of greater width than the space between the flanges, whereby it is seated against the hub not only at the bottom of said groove but also against the peripheries of said flanges.

10. A car-wheel constructed with a wheel-center formed with a solid hub of wrought metal having projecting flanges on its outer and inner faces, forming a peripheral groove between them, and the inner flange of greater diameter than the outer one, and an outer portion or fully of cast metal cast into said groove and bearing against said flanges, whereby the inner flange serves to strengthen the fully against lateral strains.

11. A car-wheel consisting of a removable tire, combined with a wheel-center formed with a solid hub of wrought metal having projecting flanges on its opposite sides, forming a deep peripheral groove between them and undercut on their approaching faces, with a cast-metal outer portion or fully cast into said groove, made with a wide bearing against said flanges, and formed of two inclined webs and an intermediate core.

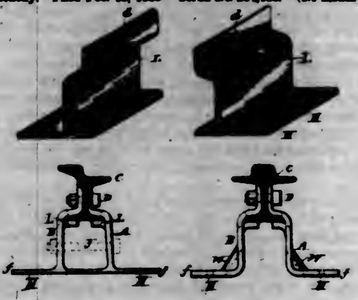
12. A car wheel and axle provided with reciprocal shoulders at the inner side of the hub to prevent the displacement of the wheel inwardly along the axle, combined with a key seated in the hub and axle to prevent the twisting of the wheel on the axle.

13. A car wheel and axle, combined with a headed key seated in the axle and hub, with its head abutting against the inner end of its keyway in the axle and receiving the abutment of the wheel-hub, whereby the wheel is kept from turning on the axle and its displacement inwardly along the axle is prevented.

14. A car wheel and axle, combined with a spring-key seated in a keyway in the axle, with its outer end abutting against the end of said keyway and its head bearing against the outer side of the hub.

15. A car-wheel having an inclined notch in its bore and a radial recess in its outer face, combined with an axle having a coinciding keyway, and a spring-key seated in said keyway with its head bridging said notch and lying in said recess.

16. The combination, with a car-wheel, of a thrust-washer secured removably to the face of its hub and projecting beyond the latter to receive the thrust.



17. The combination, with a car-wheel, of a thrust-washer of anti-friction metal secured to the face of its hub and projecting beyond the latter to receive the thrust.

18. The combination, with a car-wheel, of a thrust-washer having bosses entering sockets in the hub and fastened by screws entering through said bosses and countersunk therein beneath the plane to which the washer is to be worn down.

19. The combination, with a car-wheel, of a thrust-washer having bosses entering sockets in the hub and countersunk recesses for the screw-heads in said bosses, and divided into two portions, in order that it may be put around the axle, the line of division passing diametrically through said bosses, in order that the same screw may fasten both halves.

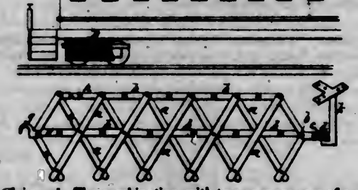
20. The combination, with a car-wheel, of a thrust-washer secured to the face of its hub, and constructed in two parts hinged together, in order that it may be put around the axle.

388,097. RAIL-CHAIR FOR GIRDER-RAILS. Reuben W. Wells, Johnstown, Pa., assignor to The Johnson Street Street Rail Company, of Kentucky. Filed Feb. 16, 1888. Serial No. 264,152. (No model.)

Claim.—1. A two-part chair for girder-rails, shaped to fit against and support the webs of the same, and provided with lugs, as L, stamped out to support the lower flanges of the rails, substantially as and for the purposes set forth.

2. A two-part chair for girder-rails, provided with lugs for clamping the flanges of the rails and with hollow side braces, both lugs and braces formed integral with the metal of the chair, substantially as and for the purposes set forth.

388,098. CENTER-BOARD FOR VESSELS. Robert W. Wells, Bennyton, assignor of one-half to Alden Schanze, South Norwalk, Conn. Filed Jan. 26, 1888. Serial No. 261,967. (No model.)



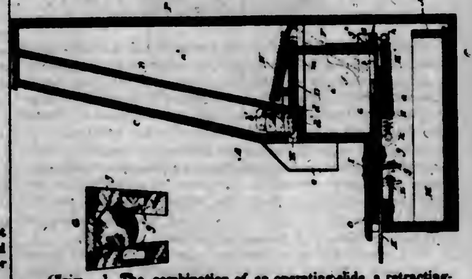
Claim.—A center-board for vessels, having at its forward lower corner a casting, 6, provided with a slot, 5, which extends from the lower edge upward and forward.

388,099. COMPOSITION FOR POLYCHROMATIC-PRINTING BLOCK. William G. White, Anerley, County of Surrey, and Robert A. A. White, Croyford, County of Kent, England. Filed Feb. 21, 1888. Serial No. 264,893. (No specimens.)

Claim.—1. A mixture for blocks to be used in polychromatic printing, consisting of petroleum jelly, a solution of resin in turpentine, Gallipoli oil, fat, and a dye, substantially in the proportions described.

2. A mixture for blocks to be used in polychromatic printing, consisting of petroleum jelly, a solution of resin in turpentine, Gallipoli oil, fat, a dye, substantially in the proportions described, and a mordant.

388,100. ATTACHMENT FOR RAILWAY-CARS. John H. Williams, Alden, N. Y. Filed Dec. 19, 1887. Serial No. 258,304. (No model.)



Claim.—1. The combination, with two or more cars of a railway-train, of extensible sections of fence attached, respectively, at the sides of the cars and capable of being extended outward in V form, to inclose the entrance to said cars, in the manner and for the purpose specified.

2. The combination, with a railroad-car, of a section of extensible fence composed of pivoted bars in the form of lazy-tongs, with pivoted links connecting the tops and center of the bars, as and for the purpose specified.

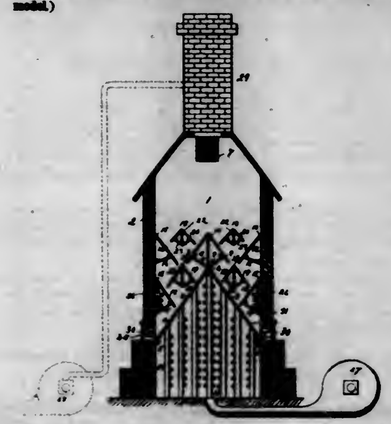
3. The combination, with the extensible sections D of fence having a hook, *g*, at their outer ends, of the portable standard L, provided with feet, to be self-supporting, and with a catch to receive the hook *g*, as and for the purpose specified.

388,101. SELLING-MACHINE. John A. Williams, Kansas City, Mo. Filed Jan. 31, 1888. Serial No. 262,882. (No model.)

Claim.—1. The combination of an operating-slide, a retracting-spring therefor, a coin-holding slide provided with arms extending across the plane of the operating-slide and adapted to sustain a coin intermediate of said slides to lock them together, a delivery-slide, a lever for connecting the coin holding and delivery slides, and a spring

for returning the delivery-slide to its normal position, substantially as set forth.

2. The combination of an operating-slide, a retracting-spring therefor, a coin-holding slide having a coin-sustaining projection extending through an opening in the operating-slide, and a stop located in the path of the coin sustained on said projection, substantially as set forth.



3. In combination, the operating slide or pull provided with a central opening and a forwardly-projected tongue therein, a coin-holding slide provided with arms extending through the opening on the said pull or slide and set far enough apart to allow the said tongue to pass freely between them, and a guideway to direct a coin into position on the arms in front of said tongue, substantially as set forth.

4. In combination, a suitable case, a horizontal operating slide or pull, a delivery-slide supported in the case, a vibrating bar or lever connecting the ends of said slides, a coin-holding slide in position to engage a coin, a spring to retract the coin holding and delivery slides, and a spring to retract the operating slide or pull, substantially as set forth.

5. In a vending apparatus, the combination of the case provided with an inclined hopper adapted to support the packages or articles to be sold one above the other, and with an opening in the bottom of the hopper in front of the articles, an operating slide or pull, a coin-holding slide adapted to be locked to the operating-slide, a delivery-slide extending across the bottom of the hopper, a lever connecting the operating and the delivery slides, the delivery-slide being adapted to be withdrawn from beneath the articles by the operating slides or pull, and to be returned by the spring to force the articles out of the case, substantially as set forth.

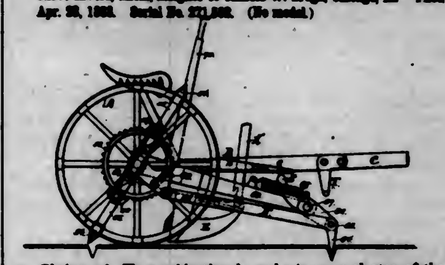
6. The herein-described case, consisting, essentially, of the extended lower section, *a*, provided with a lock-drawer and an opening in its top for the reception of coins, the less-extended middle section, *a'*, and the tapered upper section, *a²*, the slanting package-rest secured in said upper section parallel with its said tapered portion, an opening for the discharge of the packages, and a shield over the discharge-opening, substantially as set forth.

388,102. WOOD-DRYING KILN. ARMAND WYCKOFF and HENRY L. WYCKOFF, Elmira, N. Y. Filed Sept. 9, 1886. Serial No. 213,126. (No model.)

Claim.—1. In a kiln for drying kindling-wood, a casing having an inclosed chamber and an exhausting apparatus for taking away air and vapor from the top thereof, in combination with main deflecting slatted tables 3, situated in the lower part of the chamber, heating-coils arranged beneath the tables, inclined slatted tables 13, situated at the sides of the chamber opposite tables 3, other heating-coils arranged beneath tables 13, and inclined deflectors of inverted-V shape, also of slats, and arranged to direct the material to the said tables and to form open spaces throughout the mass of wood being dried, and means for furnishing air to the heaters, whereby it is first heated and then passed through the entire mass of wood, the slatted tables and deflectors facilitating such passage, substantially as set forth.

2. A casing inclosing a chamber, 1, having openings 24 formed at its opposite sides, and oppositely-inclined tables 2, formed of slats 4, terminating opposite said openings, in combination with a series of smaller grated inclined deflectors arranged above and at the sides of said tables 2 and delivering thereon, and a series of steam-receiving pipes or coils below each of said tables, and an exhaust fan or blower, substantially as described.

388,103. BALANCED SLIDE-VALVE. JAMES G. ARMOR, Cherokee, Kans. Filed Mar. 2, 1888. Serial No. 265,951. (No model.)



Claim.—1. The combination of the slide-valve, the disks arranged one on top of the other and removable from the valve, the upper disk having the central recess, the packing fitting in said recess and bearing against the top of the steam-chest, the spring-arms projecting beyond the disks, the expansion-rings encircling said disks and bearing on the spring-arms, the latter serving to normally force the expansion-rings upward, substantially as described.

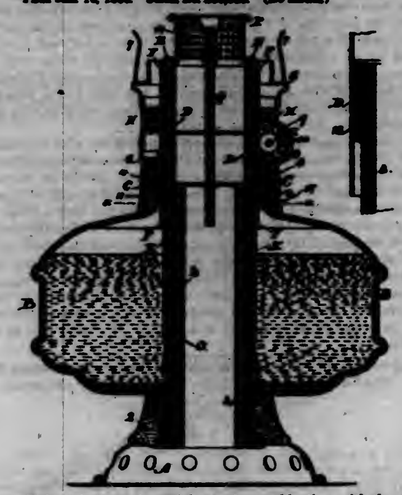
2. The combination of the valve, the disks secured on the upper side thereof, the spring-arms G, arranged on the lower disk, projecting beyond the sides thereof, and having their arms bent to form the arms H and lips I, the springs K on the upper side of arms G, the expansion-ring S, encircling the disk and bearing on the spring K, the expansion-ring T, bearing on the ring S, and expansion-ring U, encircling the ring T and bearing on the lips I, substantially as described.

3. The combination, with the slide-valve, of the disk B on the upper side thereof, said disk having the central recess or cavity and the radial openings F, communicating therewith, the springs G, arranged on disk B and having their outer ends extending through openings F and provided with the arms H and lips I, the crossed springs K on the upper side of springs G, the upper disk, L, the central screw extending through the same, through the centers of the springs, and through the lower disk and engaging the valve, the screws M, connecting the upper disk to the lower disk, the expansion-rings S T, encircling the disk, one of said rings bearing on the springs K, and the expansion-ring U, encircling the upper ring, T, and bearing on lips I, substantially as described.

388,104. CHECK-ROW CORN-PLANTER. LEWIS A. ASPINWALL, Three Rivers, Mich., assignor to Charles W. Bruce, Chicago, Ill. Filed Apr. 23, 1888. Serial No. 271,962. (No model.)

Claim.—1. The combination, in a check-rower planter, of the wheels loose on the axle with the markers and their arms permanently connected to the axle, a ratchet-wheel upon one of the driving-wheels, and pawls for connecting the axle with the driving-wheel, and with mechanism, substantially as specified, connected to said parts for correcting the position of the markers, substantially as set forth.

2. The driving-wheels and axle, in combination with the markers and their arms permanently connected to the axle, a ratchet-wheel and pawls for connecting the axle to one of the driving-wheels, a prong, connecting-rod, crank, and pawl for turning the markers by the movement of the machine when the prong is thrust into the ground, and thereby rectifying the position of the markers, substantially as set forth.



3. The combination, with the axle and markers to which they are connected, of a crank upon the axle, a connecting-rod and prong, a frame and lever for raising or lowering the prong, and a crank forming a connection between the prong and the frame, and a stationary finger or bracket acting upon the arm or finger of the crank to raise the prong out of the ground at the proper moment, substantially as set forth.

4. The combination, with the markers and the axle to which they are connected, of the cam upon the axle, the hopper and dropping mechanism connected therewith, and the plow, and the valve within the plow for dropping the corn, substantially as set forth.

5. The combination, with the driving-wheels loose upon the axle and the markers permanently connected to the axle, and the pawls and ratchet-wheel for connecting the driving-wheel to the axle, of the crank 65 upon the axle and a pawl upon the crank, a connecting-rod

and prong, and the flange 67, for acting upon the pawls, the frame 68 and lever for raising or lowering the same, a crank forming the connection between the prong and the frame, a bracket for raising the crank and prong, and a spring, 69, for returning the parts to their normal position, substantially as set forth.

388,105. ARGAND LAMP. LEWIS J. ATWOOD, Waterbury, Conn., assignor to the Plume & Atwood Manufacturing Company, same place. Filed Jan. 16, 1888. Serial No. 260,933. (No model.)

Claim.—1. In an Argand lamp, the combination, with the glass reservoir or oil-fount having a cylindrical or nearly cylindrical central glass air-tube integral therewith and extending to the top of the reservoir, or nearly so, of a sheet-metal air-tube surrounding the glass air-tube and extending down into the reservoir and firmly attached to such glass air-tube, so as to form an internal wick-tube and a guide for the wick, substantially as set forth.

2. The combination, in an Argand lamp, with the glass reservoir having a central glass air-tube, 3, and a glass rim, 4, in one piece, of a sheet-metal air-tube, D, surrounding and secured to the glass air-tube 3 and extending down into the reservoir, and also above such air-tube 3, and the sheet-metal collar C, over the glass rim 4, and having an interior cylindrical portion, 5, that is concentric to and parallel with the sheet-metal air-tube D, the collar being secured to the glass rim 4, substantially as and for the purposes set forth.

3. The combination, in an Argand lamp, with the glass reservoir having an air-tube, 3, and rim 4, of a sheet-metal air-tube, D, surrounding and fastened to the air-tube 3, the sheet-metal collar C, having an internal cylinder, 5, that is concentric with the sheet-metal air-tube D, and is connected to the rim 4, and the external wick-tube, F, passing down within the collar C, provided with slots and intervening springs to form a friction for retaining the parts in place, substantially as set forth.

4. The combination, in an Argand lamp, with the glass reservoir having a central glass air-tube, 3, and rim 4, of a sheet-metal air-tube, D, fastened to the air-tube 3 and extending downward in the reservoir, the collar C, having an internal cylinder, 5, and connected to the rim 4, the wick-tube F, passing down within the collar C and extending up to the top of the wick-tube, or nearly so, the air-distributer, chimney-holder, and deflector, the wick-raiser supported by the air-distributer, and the rank-cylinder surrounding the wick and having perforations for the teeth of the wick-raiser, substantially as set forth.

5. The combination, in an Argand lamp, with the glass reservoir having a central glass air-tube and a rim around the upper end, of a collar connected to the rim and having a cylindrical interior and a metal tube or band that is concentric with the collar and surrounds the glass air-tube of the reservoir and is permanently attached around the same, substantially as set forth.

6. The combination, in an Argand lamp, with the reservoir having central air-tube and rim all in one piece of glass, of a sheet-metal air-tube surrounding and fastened to the glass air-tube, a sheet-metal collar with an internal cylinder that is connected to the glass rim and concentric with the sheet-metal air-tube, and the external wick-tube passing down within the collar, substantially as set forth.

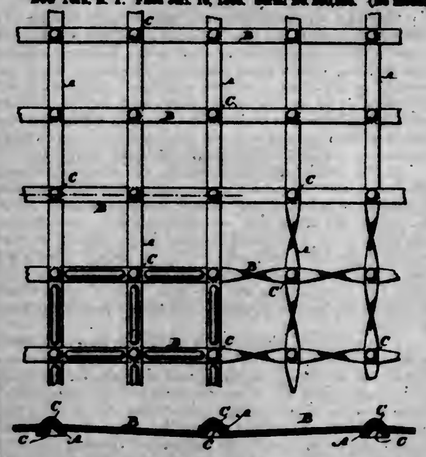
7. The combination, in an Argand lamp, with the reservoir having a central air-tube and rim in one piece of glass, of a hollow metallic collar having a cylindrical interior and receiving the glass rim and connected thereto, and a sheet-metal air-tube concentric with the collar and permanently affixed to the glass air-tube, substantially as set forth.

8. The combination, in an Argand lamp, with the glass reservoir having a central glass air-tube, 3, of a sheet-metal air-tube, D, extending down into the reservoir and fastened to such air-tube 3, and the sheet-metal collar C, having an interior cylindrical portion, 5, that is concentric to and parallel with the sheet-metal air-tube D, the collar being secured to the glass, substantially as set forth.

388,106. GUY-FASTENER. THOMAS E. BARROW, Mansfield, Ohio. Filed May 21, 1887. Serial No. 238,333. (No model.)

Claim.—A self-fastener consisting of a main portion and an engaging device, substantially as described, for attaching the cord, said main portion having a recessed side piece and a contiguous straight side piece forming a series of openings for the adjustment of the cord.

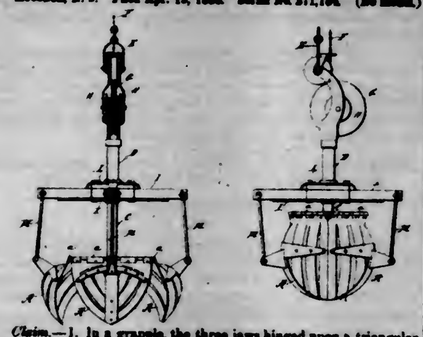
388,107. TWO-WHEELED VEHICLE. JOHN S. BARSHEY, Bellefonte, Pa. Filed July 13, 1887. Serial No. 244,178. (No model.)



Claim.—1. The combination of the axle, the shafts connected directly thereto, and having portions curved upward in front and rear of the axle, and springs connected to the shafts in front and rear of the axle, and carrying the body of the vehicle, all substantially as specified.

2. The combination, in a two-wheeled vehicle, of the axle, shafts connected directly thereto, springs connected to the shafts, seat-irons, and brackets connected to the springs, a seat secured to said seat-irons, and a foot-board secured to the brackets, all substantially as described.

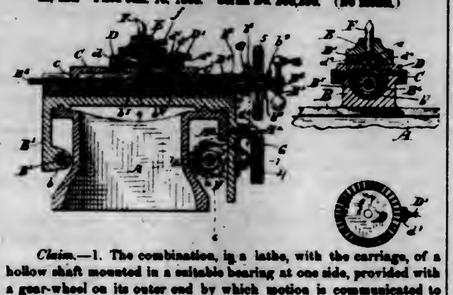
3. The combination, in a two-wheeled vehicle, of the axle, the shafts connected thereto, the springs connected to the shafts, the seat-irons and seat secured to the springs and located directly above the axle, and a foot-board carried by brackets curved and bent so as to clear the axle and the shafts as the springs yield, all substantially as set forth.



388,108. METALLIC RAILING AND GUARD. ADELBERT BATAILLE, New York, N. Y. Filed Jan. 16, 1888. Serial No. 260,932. (No model.)

Claim.—1. A guard or grating formed of straight intersecting bars interwoven at regular intervals, the bars or strips having hollow tents or projections at the intersections, setting the one within the other, to hold the bars firmly at such intersections, substantially as set forth.

2. The metallic bars or strips for ornamental gratings or guards having hollow projections or tents, the one fitting within the other, at regular intervals, adapted to form the connections at the intersections of the bars when placed together, substantially as set forth.



388,109. SELF-ADJUSTING GRAPPLE. ALEXANDER BERGEN, Rebstown, N. J. Filed Apr. 19, 1888. Serial No. 271,104. (No model.)

Claim.—1. In a grapple, the three jaws hinged upon a triangular base, and a tripod connected with said jaws by the hinged rigid rods and mounted upon a ball-and-socket joint, the parts being combined and arranged for operation, substantially as shown and described.

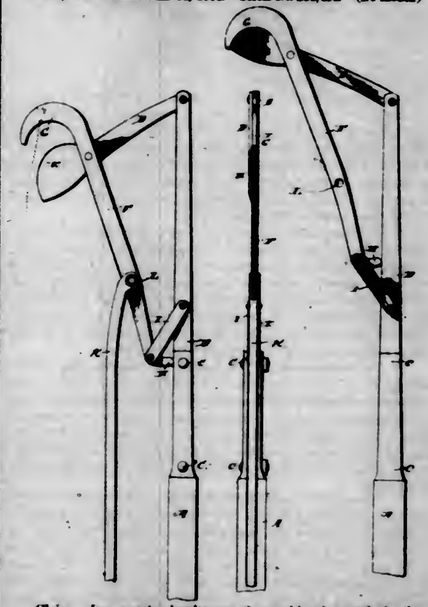
2. In a grapple, the open-work jaws hinged upon a triangular base-piece, the tipping or tilting tripod connected with said jaws by the hinged rigid rods, the operating rods or sleeves, and hoisting chains or cables connected with the tripod and jaws, all combined and arranged substantially as and for the purposes set forth.

388,110. LATHE FOR TURNING ARTICLES HAVING LONGITUDINALLY-CURVED SURFACES. CHARLES A. REISSNER, Indianapolis, Ind. Filed Jan. 10, 1888. Serial No. 260,260. (No model.)

Claim.—1. The combination, in a lathe, with the carriage, of a hollow shaft mounted in a suitable bearing at one side, provided with a gear-wheel on its outer end by which motion is communicated to said shaft and another gear-wheel on its inner end, a sliding part mounted on said carriage, provided with a slot through which said gear-wheel on the inner end of said hollow shaft projects, a circular plate pivoted on the top of said sliding part and formed with cogs around its edge engaging with said gear-wheel, and the tool-holder mounted on said circular plate, substantially as set forth.

2. In a turning-lathe, the combination, with the carriage thereof, of a hollow shaft mounted in a suitable bearing thereon, a sliding part, C, mounted on the top of said carriage, the screw-threaded rod B^2, mounted in said hollow shaft and engaging with a screw-threaded perforation at one side of said sliding part, the gear-wheel b^7, mounted to slide on said hollow shaft and extending up through a slot in said part C, the circular plate D, pivoted on the top of said part C, provided with cogs engaging with said gear-wheel b^7, and the tool-holder carrying the tool mounted on said circular plate, substantially as set forth.

3. In a lathe, the combination of the carriage carrying a hollow shaft at its top and a chain of gearing on its side engaging with said hollow shaft for driving the same, a solid shaft mounted within said hollow shaft formed with a screw-threaded end, the sliding part C, mounted on top of said carriage and provided with an ear, *c*, having screw-threaded perforation arranged to engage with said screw-threaded end of the shaft B^2, the gear-wheel b^7, mounted to slide on said hollow shaft B^2, the circular plate D, pivoted to said part C and provided with cogs engaging with said gear-wheel b^7, and the tool-holder mounted on said circular plate D, substantially as set forth.



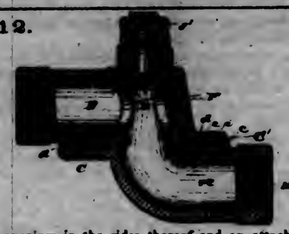
4. The combination, in a turning-lathe, with the carriage and mechanism for supporting the tool, of a circular plate pivoted on the top of said carriage, the gearing for operating said plate, the tool-holder mounted to slide on the top of said plate, means, substantially as described, for adjusting it in front of or behind the center of said plate, and the tool mounted in said tool-holder, substantially as described, and for the purposes specified.

5. The combination, in a lathe, with the carriage thereof and mechanism for supporting and operating the tool, of a tool-holder adjustably mounted on a pivoted part on said carriage and provided with a vertical socket, and the tool mounted in said socket of said tool-holder in a vertical position, substantially as described, and for the purposes specified.

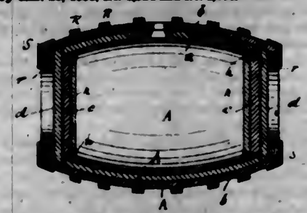
6. The combination, in a turning-lathe, of the carriage, the means for driving the same, a shaft extending through a portion formed in the front side of said carriage and provided with a gear-wheel on each end, the inner one of which engages with a rack-bar on the bed of said lathe, the hollow shaft B^2, journaled at the top of said carriage and having a gear-wheel mounted on its outer end, and a chain of gearing connecting said two gear-wheels, the circular plate D, pivoted on the top of said carriage and provided with cogs around its edge, and the gear-wheel b^7, mounted on said shaft and engaging with said circular plate, substantially as set forth.

7. The combination, in a turning-lathe, of the shaft A^2, means for driving the same, the miter gear-wheel *a*, mounted to slide thereon, the carriage arranged to slide on the bed of said lathe, carrying a short shaft, B^4, in a bearing mounted in its front side, the gear-wheel 3, mounted on said short shaft and engaging with a wheel, *a*, the device b^3, engaging with said wheel *a* to hold it into connection with the wheel 3, the wheel 4, mounted on the outer end of said shaft B^4, the shaft B^2, mounted in the top of said carriage carrying the wheel 5, the swinging frame G, carrying a chain of gearing arranged to connect said wheel 5 with said wheel 4 when it is desired, and the mechanism for supporting and operating the tool mounted on the top of said carriage and connected to said shaft B^2, substantially as set forth.

388,111. PRUNING IMPLEMENT. ANDREW ESTERBROOKS, Hebron, Nebr. Filed Jan. 11, 1888. Serial No. 260,461. (No model.)



Claim.—In a pruning implement, the combination, with the shank B, having a suitable handle at its lower end, the knife-arm D, pivoted to the upper end of said shank, and the convex knife E on the outer end of said arm, of the arm F, having the edgeless hook G on its upper end and pivoted below said hook to the arm D, just to the inner side of the knife E, the pivoted links I, connecting suitable points of the shank and arm F, and the inwardly-standing step forming the lower end of said arm and acting as both an upper and lower stop for the hook and knife, substantially as specified.

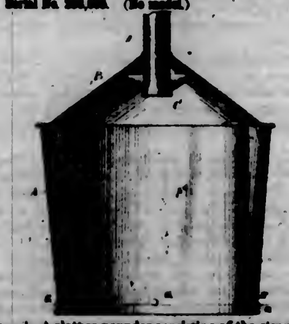


388,112. FLEXIBLE PIPE-COUPLING. BENJAMIN BROWNER, Wilkes-Barré, Pa. Filed Nov. 14, 1887. Serial No. 255,261. (No model.)

Claim.—In a pipe-coupling, the combination of the two shells A and B, each provided with an annular flange in line with one wall of said shell, the said flanges being the one provided with V-shaped recesses and the other with annular projections fitting the recesses of the other, the said shell A also having the tapering projection provided with openings in the sides thereof and, an attaching-bolt, the shell B being provided with the stuffing-box around the said bolt, and the nuts J J', substantially as described.

388,112.

388,113. PAPER BARREL. ADOLF BEAR, Cologne, Prussia, assignor to Keiser & Co., Barmbold, Germany. Filed Feb. 28, 1888. Serial No. 265,593. (No model.) Patented in Germany Nov. 22, 1887, No. 43,288; in France Dec. 24, 1887, No. 187,888; in England Jan. 17, 1888, No. 745; in Belgium Jan. 31, 1888, No. 83,519, and in Austria-Hungary Mar. 20, 1888, No. 3,934 and No. 1,792.



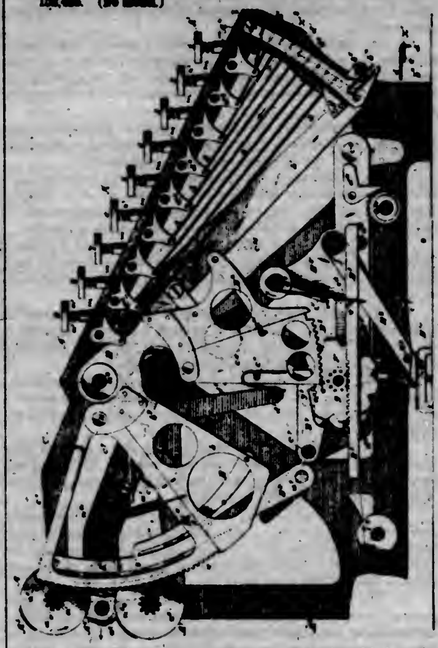
Claim.—1. A paper barrel composed of end rings, paper heads within and on said end rings, and a paper shell formed of a series of sheets pasted upon each other, said sheets being provided with tapered notches in opposite edges, substantially as herein shown and described.

2. A paper barrel composed of end rings, heads on and within said end rings, and a paper shell composed of a series of sheets of paper pasted upon each other, said sheets having tapered notches in opposite edges, part of the shell thus formed projecting beyond the heads, and additional rings placed against the outer edges of the heads and the inner surfaces of those parts of the shell projecting beyond the heads, substantially as herein shown and described.

3. A paper barrel composed of the end rings, A, the disks *c* within said rings A, an inner paper shell, *a*, extending to the outer edges of said rings A, the disks *d*, secured on the disks *c* and extending to the outer circumference of the shell *a* at the ends, the outer paper shell, *b*, extending beyond the outer disks, *d*, and additional rings, *r*, placed against the outer disks, *d*, and within that part of the outer shell, *b*, projecting beyond the disks *d*, substantially as herein shown and described.

388,114. WASHING-MACHINE. DAVID R. BRAMBALL, Rayne, assignor of one-half to William W. Dunn, Crowley, La. Filed Oct. 21, 1887. Serial No. 253,033. (No model.)

Claim.—1. A clothes-pounder consisting of the circular upwardly-flared body having perforations near its lower edge and provided with a conical top having a socket for a suitable handle, and a cylindrical imperforate shell secured within the body, substantially as specified.



2. A clothes-pounder comprising the upwardly-flared body having perforations near its lower edge, the imperforate shell, the bolts G, inserted through the lower edges of the shell and the body, and the sleeves H, surrounding the bolts between the shell and the body, as set forth.

388,115. PLAYING-CARD. SAMUEL BRENTNALL, New York, N. Y. Filed Mar. 9, 1888. Serial No. 266,751. (No model.)

Claim.—A card-package consisting of a pack of ordinary playing-cards and a series of cards provided with perforated lines forming fields or spaces, substantially as herein shown and described.

388,116. CALCULATING-MACHINE. WILLIAM S. BURROUGHS, St. Louis, Mo., assignor, by direct and mesne assignments, to the American Arithmometer Company, same place. Filed Jan. 10, 1888. Serial No. 260,468. (No model.)

Claim.—1. The combination of a series of numbered independent indicators, a series of independent keys to each indicator, connections between each of the series of keys and each indicator, said connections being arranged to insure the movement of each indicator upon the movement of any key of its series and including a series of steps to each series of keys adjustable by but independent of the keys, arranged to vary the extent of movement of the indicator according to the position of the key struck, substantially as described.

2. The combination of a series of independent indicators, a series of keys to each indicator, connections whereby each indicator is operated on the movement of any key of its series, connections whereby each indicator on completing a revolution turns the adjacent indicator of higher order one step, and means for disconnecting the indicators from the connections after each number is registered to permit the connections to assume a position to operate the indicators to register another number, substantially as described.

3. The combination of the series of independent numbered indicators and a series of independent keys having, uniform movements connected with each indicator and constructed to operate two or more of the indicators simultaneously when released by the action of two or more keys, and locking and releasing devices operated by but independent of the keys for releasing and regulating the movement of the indicator-operating devices, substantially as described.

4. The combination, with the series of indicators and with a series

of keys connected with each indicator, of a series of levers each connected to turn the indicator by its movement, and locking and releasing and regulating devices arranged between each lever and its keys, whereby the lever is released and its movement regulated according to the position of the key struck, substantially as set forth.

5. The combination, with the indicators and pinions and independent keys arranged in series, of actuating-levers carrying racks engaging with the pinions and regulating devices between each lever and each series of keys, the keys capable of movement independently of said devices, substantially as specified.

6. The combination, with the keys, indicators, and intermediate operating-connections between each key and each indicator, of means, substantially as described, for moving the indicators to throw them out of gear with the said connections upon their return motion, substantially as set forth.

7. The combination, with one or more keys, a series of levers, indicators, and pinions, of devices for throwing the indicators out of connection with the levers after the indicators have been operated by the movements of the keys, substantially as set forth.

8. The combination, with the indicators and pinions and with the operating levers and racks, of appliances for throwing the pinions and racks out of gear after the movement of the indicators, for the purpose specified.

9. The combination, with the indicators, a series of keys to each indicator, and a series of levers for operating the indicators, of appliances for throwing the indicators out of gear with the operating devices when the latter are moved in one direction, substantially as specified.

10. The combination, with the keys, a series of independent rack-levers and indicators, of a frame supporting the indicators and adjustable to and from the said levers, substantially as set forth.

11. The combination, with the series of operating rack-levers, the shaft a^2, and indicators supported by said shaft a^2, of a vibrating frame provided with edges bearing against the shaft and constructed to move the latter to and from the levers, substantially as specified.

12. The combination, with the indicators, keys, and a series of levers acting upon the indicators, of a cross-bar and means for moving the bar to restore the levers to their normal positions, substantially as specified.

13. The combination, with the indicators, a series of independent operating rack-levers, and series of keys, of a cross-bar arranged to move the levers to their normal position after they have been lifted by the action of the keys, substantially as set forth.

14. The combination, with the indicators and actuating-levers and independent keys, of a frame carrying a cross-bar arranged to strike the actuating-levers, and a handle connected to operate said frame, substantially as set forth.

15. The combination, with the indicators and a series of independent rack-levers, of a frame carrying a cross-bar for moving said levers, and devices whereby to throw the indicators in and out of gear with the levers, substantially as specified.

16. The combination, with the indicators, a series of independent keys to each indicator, and a series of independent intermediate connections, of a regulating device between the said connections and the keys, constructed to insure and determine the movement of the connections, substantially as set forth.

17. The combination, with the indicators and a series of independent keys to each indicator, of a separate connection for moving each indicator, and a lock connected to be operated by each key of the series, whereby each connection is held in its operative position, substantially as set forth.

18. The combination, with the series of keys, indicators, and intermediate connections, of a lock for securing each connection, and connections between each key and the lock, whereby said lock is operated by each key of the series, substantially as specified.

19. The combination, with the series of independent indicators, a series of keys to each indicator, and an operating-lever to each series of keys, of a locking-plate and connections between each key and said plate, substantially as set forth.

20. The combination, with the indicators, keys, operating connections, and locks, of stops, each connected to be operated by one of the keys and arranged to limit the movement of the operating-connections according to the key depressed, substantially as specified.

21. The combination, with the indicators, keys, and operating-connections, of a series of stops for limiting the movements of said connections, each connected to and movable by one of the keys, substantially as set forth.

22. The combination, with the operating-lever and a series of keys, of a corresponding series of stops arranged to limit the movements of the lever, and connections between each key and one of the stops, substantially as specified.

23. The combination of the operating-lever carrying an arm provided with a lip, 3, a series of stops and connections between the stops and keys, whereby any one of the stops may be thrown into the path of the lip, substantially as specified.

24. The combination, with the operating-lever and a series of keys, of a lock for securing the lever in its elevated position, a series of stops for limiting the downward movements of the lever, and connections between each key and the lock and one of the stops, substantially as specified.

25. The combination of a frame having a stationary shoulder, the operating-lever, keys, notched bar, stops connected to be operated by the keys, and a strip, b^3, pivoted to the lever, constructed to engage with said stationary shoulder on the frame, and provided with a lip, 3, arranged to engage with the stops, substantially as specified.

26. The combination, with each indicator and a series of keys to each indicator, of a series of independent intermediate connections, a spring for operating each connection to a limited extent independently of the key, a detent, and means for releasing the latter to permit the connection on one indicator to move independently of the key and operate its indicator when the adjacent indicator completes its revolution, substantially as specified.

27. The combination, with a series of indicators, a series of keys, and connections, of means for operating the latter upon the movement of any key or keys, the said connections being provided with parts capable of a limited movement independent of the other parts, with locking devices, and with means for releasing the latter as each indicator completes a revolution, substantially as set forth.

28. The combination, with a series of indicators, of a corresponding series of actuating devices, and connections whereby the actuating device of one indicator is moved one step, whether in motion or at rest, as the adjacent indicator completes its movement, substantially as set forth.

29. The combination, with the series of indicators and series of keys and series of independent actuating-connections between the keys and indicators, of means, substantially as described, for turning each indicator one step independently of the key action as the next lower indicator completes a revolution, substantially as described.

30. The combination, with the indicators and keys, of actuating-levers constructed to move the indicators under the action of the keys, and each lever consisting of two parts, one having a limited movement independent of the other under the action of a spring, a look for holding the two parts in connection, and connections between the indicators and locks, whereby each movable portion is released to automatically actuate the adjacent indicator as the next indicator completes its revolution, substantially as set forth.

31. The combination, with the indicating-disks and keys, of levers, each provided with a part geared with one of the indicators and capable of a limited movement to turn the latter, with a locking-lever, and connections between the latter and the adjacent indicator, substantially as and for the purpose set forth.

32. The combination, with the indicators, of operating-levers in two parts, and locking-levers E' and E², substantially as specified.

33. The combination, with a series of indicators, keys, and intermediate connections, of one or more additional series of indicators, and means for throwing either series into connection with the operating devices, substantially as set forth.

34. The combination of a series of indicators, a series of keys to each indicator, and connections whereby each indicator may be set by the action of any key of one series, and a device for restoring the connections to their normal positions at the will of the operator, substantially as set forth.

35. The combination, with the series of keys, of two or more registering devices, each consisting of a series of numbered indicators, and series of intermediate independent operating-connections, and means for turning the registering devices to bring either one of the same into connection with the operating devices, substantially as set forth.

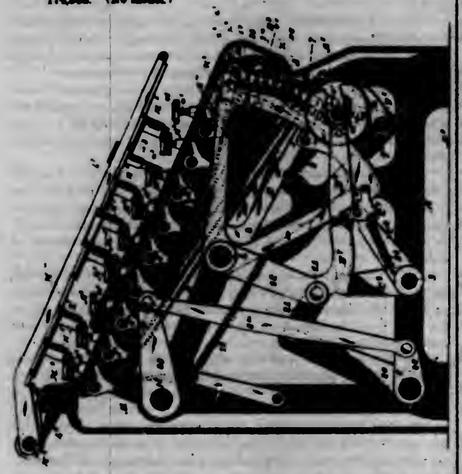
36. The combination of a series of indicators, and operating-keys and connections for moving said indicators, and operating appliances independent of the keys and indicators, whereby each indicator is moved one step by said appliances independently of the keys as the adjacent indicator completes its revolution, and devices operated by the indicators for throwing said appliances into action as each indicator completes its revolution, substantially as described.

37. The combination, with two or more series of keys, of a series of printing-indicators and independent connections, whereby each indicator is controlled by each key of one of the series, and means for throwing the indicators out of gear with the connections, substantially as set forth.

38. The combination, with the series of keys and registering device operated therefrom, of an independent printing-recorder, and connections whereby the latter is moved from the same keys and to the same extent as the said registering device, and means for throwing each register out of gear with the connections, substantially as described.

39. The combination, with the series of disks provided with lateral pins, of levers B, racks hung to said levers, and locking-levers E', and springs c', substantially as described.

40. The combination of the disks provided with pins a^2, levers carrying racks pivoted thereto, springs c', locking-levers E', and levers E², substantially as described.



41. The combination, with the register and the recorder, of levers each carrying two series of racks capable of independent movement, one gearing with the register and the other with the recorder, and rack-operating devices, substantially as described.

42. The combination, with the levers B, carrying racks pivoted thereto, and locking-levers E', of two adjustable registers, and levers E², constructed to operate with the disks of each register, substantially as described.

43. The combination of the keys, indicating-register, intermediate connections, and printing-recorder, frame E³, carrying the same, and toggle-levers d^3 d^4, substantially as described.

44. The combination, with the independent keys arranged in series, and indicators and connections, of levers d^2, slotted plate c, and rods d, connected to the levers and having terminal stops, substantially as described.

388,117. CALCULATING-MACHINE. William S. Burroughs, St. Louis, Mo., assignor, by direct and mesne assignments, to the American Arithmometer Company, same place. Filed Aug. 17, 1888. Serial No. 174,562. (No model.)

Claim.—1. The combination, with the register of a mechanical calculator provided with a series of independently-adjustable wheels, with a series of keys to each wheel, each wheel having two series of numbers from 0 to 9 in line with each other on the periphery of the wheel, but in reverse order, of a sight-plate adjustable so as to exhibit the numbers of either series without showing those of the other series, and register-wheel-operating devices whereby each wheel is moved a distance equal to that between the adjacent numbers of one series at each movement, substantially as described.

2. The combination, with a register consisting of a series of wheels, each provided with two series of numbers from 0 to 9 alternating in one line with each other on the periphery of the wheel, but in reverse directions, of numbered keys and connections whereby the wheels can be turned by operating the keys in one direction to set up a minuend corresponding to the numbers on the keys, and reversing devices and connections whereby the wheels are reversed from the second action of the keys in striking the subtrahend to indicate a number corresponding to the difference between the minuend and subtrahend, substantially as described.

3. The combination of the register having wheels provided with two series of numbers from 0 to 9 in reverse order, keys, intermediate operating devices between each key and its wheel, and adjustable bearings for the register to carry the wheels to and from the said operating devices, substantially as described.

4. The combination, with a series of register-wheels provided with two series of numbers arranged in reverse order, of a series of keys to each wheel and wheel-operating devices constructed to be set in different positions, according to the key struck, adjustable bearings for the wheels, whereby they may be moved into and out of connection with said devices, and a restoring device whereby the operating devices may be simultaneously restored to their normal position after being set by the keys and after the wheels are in connection therewith, substantially as described.

5. The combination of a series of wheels numbered with two series of numbers in reverse order, a series of keys to each wheel, intermediate operating devices whereby each wheel is operated to an extent determined by the key struck, actuating devices independent of the keys, whereby each wheel is turned one step as the next lowest wheel completes its revolution, and adjustable bearings for the wheels, whereby they may be carried into and from connection with the operating devices, substantially as described.

6. The combination, with the series of indicator-wheels, of a lever, B, to each wheel, provided with steps, step-adjusting keys connected with said steps, an actuating-sector for each wheel carried by each lever, and appliances, substantially as described, for imparting a limited movement to each lever to turn the wheel one step, for the purpose set forth.

7. The combination of the registering-wheels, a series of keys, pivoted levers B, each carrying a series of stops actuated by the series of keys, a movable toothed segment carried by each lever, and a movable bearing supporting each lever, substantially as set forth.

8. The combination, with each registering-wheel and with each series of keys and stop devices, of an adjustable lever supporting the said stop devices and a movable toothed segment gearing with a pinion connected with the lever, and a movable locking-arm carried by the segment and serving in connection with the stop devices to determine the movement of the segment and the wheel, substantially as set forth.

9. The combination, with the indicator-wheels, their actuating-segments, stop devices, and movable levers B, carrying the segments, of arms having bearings for the levers and lock-bars constructed to hold said arms in one position and to be operated by pins upon the wheels to release the arms to take a different position, substantially as set forth.

10. The combination, with register-wheels, movable bearings for the register-wheels, the operating-segments, and restoring-bar, of a cam moving with said bar, an arm connected to the bearings of the register-wheels, and an adjustable bearing upon the arm adapted to be thrown into and out of contact with the cam, for the purposes set forth.

11. The combination, with the indicator-wheels, operating-segments, and levers B, of a shaft carrying arms F², affording bearings for the levers B, springs bearing against the arms to throw them outward, and a movable bar, 33, arranged to be brought against the arms to swing them simultaneously inward, substantially as set forth.

12. The combination, with a mechanical calculator having a register, of a movable frame provided with guides and adjustable fingers arranged to be brought in contact with the parts of the machine actuating and regulating the movements of the register, substantially as set forth.

13. The combination, with the key-board and registering devices of a mechanical calculator and with the keys thereof, of a frame capable of being moved to and from and across the keys and provided with a series of adjustable fingers, substantially as set forth.

14. The combination of a mechanical calculator, a movable frame carrying a series of adjustable fingers, and a registering device, R³, arranged to register the number of the movements of the frame, substantially as set forth.

388,118. CALCULATING-MACHINE. William S. Burroughs, St. Louis, Mo., assignor to the American Arithmometer Company, same place. Filed Mar. 17, 1886. Serial No. 195,583. (No model.)

Claim.—1. The combination of a series of register-wheels, a series of keys to each wheel, a separate stop connected to be set by each key, and connections between each wheel and its stops, constructed to turn the wheels and arranged to be moved by hand each to an extent determined by the position of one of the stops, substantially as described.

2. The combination, with the registering-wheels and a series of independent keys to each wheel, and intermediate wheel-operating devices, of a series of stops and connections between each series of keys and each stop, substantially as described, whereby the stops are set in different positions on operating the keys to vary the extent to which the wheels may be thereafter turned by the operating devices, substantially as described.

3. The combination, with the series of keys and independent registering-wheels of a mechanical calculator, one wheel to each series of keys, of regulators for regulating the turning of each wheel and operating devices between the keys and said regulators, whereby the parts of the latter are set in different positions prior to the said devices being operated to turn the wheels, substantially as described.

4. A mechanical calculator provided with a series of register-wheels and independent stops and with series of keys, and connections for setting the stops in different positions prior to turning the wheels, whereby each wheel is turned to an extent according to the position

388,118.

to which its stop is set prior to turning the wheel, substantially as described.

5. The combination, with the independent register-wheels of a mechanical calculator, of a series of keys and a series of stops connected to be adjusted by each series of keys, wheel-operating devices for turning each wheel, governed in extent of movement by the stops, and an adjustable carrier for throwing the wheels into and out of connection with the turning devices, substantially as described.

6. The combination, with the independent register-wheels, series of independent keys and connections, and wheel-actuating devices for operating the wheels from the adjustment of the keys, of a restorer for restoring said connections simultaneously to normal position, substantially as described.

7. The combination of the register-wheels and their operating devices, keys, and stops, and register-carrier, and carrier-moving devices, substantially as described, for throwing the wheels out of connection with said devices when they are being set and into connection therewith, and for simultaneously restoring the devices to normal position, substantially as described.

8. The combination, with the independent register-wheels, a series of stops to each wheel, and wheel-operating devices between each series of stops and each wheel, and keys adjustable independently of the stops of a movable register-carrier and actuating devices, substantially as described, whereby the wheels and operating devices are automatically thrown out of connection before the devices are set and then are thrown into connection, substantially as described.

9. The combination of the register-wheels, a series of independent keys to each wheel, intermediate wheel-operating devices, and a single handle for moving all the wheel-operating devices simultaneously, substantially as described.

10. The combination, with the register-wheels, racks for rotating them, a lever for moving the racks while in gear with the wheels a series of stops for arresting the movement of each rack, and a series of keys to each rack, whereby the different stops are moved, substantially as described.

11. The combination of the register-wheels, operating-racks, stops which may be adjusted to limit the movement of each rack, and appliances for throwing the wheels and racks out of gear while the racks are being set in position, substantially as described.

12. The combination of the series of register-wheels and a series of racks gearing therewith, a hand-lever whereby to move the racks to turn the wheels, and appliances for putting the wheels into and out of operative connection with the racks, substantially as described.

13. The combination, with the register and series of operating-levers, of a series of retainers for supporting the levers in their normal position without interfering with their further upward movement, a detent for holding each lever against such upward movement, and an actuating device connected with each lever and between each lever and the detent of the adjacent lever, for transferring motion to said detent, substantially as described.

14. The combination of the series of register-wheels, a series of keys to each wheel, a rack-lever constructed to turn each wheel, appliances for applying power to raise and lower the rack-lever, and a series of stops adapted to be arranged in different positions to define the movements of each lever, and connections between each series of stops and one of the series of keys, substantially as described.

15. The combination of the register-wheels, wheel-operating devices, means for throwing the said devices and register into and out of connection, and retainers for retaining said devices in one position, series of stops, a series of keys to each series of stops, and connections independent of the stops between each series of keys and one of the retainers, whereby the latter may be moved by the movement of any key of the series, substantially as described.

16. The combination, with the series of wheels, keys, and wheel-operating devices, of stops for limiting the movements of said devices, a retainer for holding each device in its normal position, a series of keys, and connections independent of the stops, whereby each retainer may be operated by any key, and a restoring device whereby all the retainers are returned to position simultaneously, substantially as described.

17. The combination, with the stops and keys, of independent levers connected to the stops, and a spring interposed between each lever and a bearing to retain the lever in whichever position it is set and prevent its ready displacement, substantially as described.

18. The combination, with the keys, stops, levers, and connections between the levers and stops, of independent bars having connections with each key of the series, and appliances for moving all the bars simultaneously to restore the parts to position, substantially as described.

19. The combination of a series of keys and springs for lifting the same, levers, stops, and connections between each lever and its stop, a bar having bearings for moving the levers simultaneously in one direction, and a spring having its bearing on each lever and holding it to either position to which it is set by the key or bar, substantially as described.

20. The combination, with the series of independent racks and stops, of an operating-frame and yielding connections between each rack and the frame, whereby the latter may be moved with some of the racks upon the motion of other racks having been arrested, substantially as described.

21. The combination of the racks having bearings and a rack-operating frame provided with arms D', carried by the frame, and springs for holding the arms in frictional contact with the bearings on the racks, substantially as described.

22. The combination of the racks having bearings, an independent retainer for each rack, and an operating-frame having parts bearing frictionally on the bearings of the racks, substantially as described.

23. The combination of the racks and an operating-frame carrying arms D', said arms having shoulders, and springs arranged to force each arm against a bearing on the adjacent rack, substantially as described.

24. The combination of the racks and means for moving them positively, and a register having a wheel engaging with each rack, and devices whereby each register-wheel is automatically moved out of connection with each rack prior to the movement of the latter in one direction and all the wheels are put into gear with all the racks upon the reverse simultaneous movement of all the racks, substantially as described.

25. The combination, with the racks and register, of a frame and yielding connections between the latter and the racks, and devices connected with the frame and the register, whereby the register and racks are thrown out of gear on the movement of the frame in one direction, substantially as described.

26. The combination of the racks, the rack-operating frame connected to have a limited movement independently of the racks, a register constructed to be operated by the racks, and connections whereby the register and racks are thrown out of gear on the movement of the frame in one direction, substantially as described.

27. The combination of the movable register and carrier, and rack-operating frame having cam-edges, the register-carrier having arms bearing on said cam-edges as the frame moves in one direction, and capable of being turned away from the frame as the latter moves in the opposite direction, substantially as described.

28. The combination of the keys, register, and carrier therefor and the operating-racks and the series of stops to each rack, whereby to permit the racks to be moved in one direction independently of the register to positions determined by the stops, and to then all simultaneously move in the other direction in connection with the register substantially as described.

29. The combination of the series of racks, register, rack-frame constructed to throw the register-wheels into and out of connection with the racks, a catch for holding the frame, and appliances for moving the catch as the rack-frame descends, substantially as described.

30. The combination of the wheels A, the rack-levers provided with studs a^2, and the levers D^3, carrying the arms D', each arm having a shoulder, g, and a spring for throwing out each arm, substantially as described.

31. The combination of the racks, the rack-frame provided with cam-edges 2 3 4, the register having wheels A, a shaft, a, sliding bearings for said shaft, and arms a^3, arranged to bear on the said cam-edges, and a stop limiting the turning of the arms in one direction substantially as described.

32. The combination, with the register-wheels and pins and operating-racks and series of keys, of detents supported by the main frame and arranged to contact with and limit the movements of the said racks, and in position to contact with the pin of the adjacent wheel as the latter completes a revolution, and a motor whereby each rack is moved one step when released by the action of the adjacent wheel, substantially as described.

33. The combination, with the series of keys and wheels of a register and with racks turning the same, of a series of stops to each rack, detents supported independently of the racks and limiting the normal movement of the racks, and devices whereby each stop is displaced to permit the rack to move one step whenever the adjacent wheel moves beyond a complete revolution, substantially as described.

34. The combination of the series of racks, series of detents suspended from fixed supports, and register-wheels, each provided with a pin arranged to make contact with and move one of said detents out of position as the wheel completes a revolution, and the series of motors for moving the racks, substantially as described.

35. The combination of the racks and pins b^5, suspended forked detents, and register-wheels having pins w, substantially as described.

36. The combination of the register-wheels and racks for moving them, of detents supported independently of the racks for limiting the movement of the racks, and appliances for moving said detents while the wheels are being moved by the racks, substantially as described.

37. The combination, with the register-wheels, racks, stops, and devices for moving the racks positively to their normal positions, of detents suspended from fixed bearings for arresting the racks, keys and connections for setting the stops, devices whereby each detent is moved out of position as each wheel completes a revolution, and independent motors for moving each rack when released by the detent, substantially as described.

38. The combination of the register-wheels, racks, detents suspended independently of the racks, rack-moving frame, and springs arranged to move the racks independently of the frame, substantially as described.

39. The combination of the wheels and pins w, the rack-moving frame, racks and spring-motors, and detents having inclined edges arranged to be struck by the pins w, substantially as described.

40. The combination, with the register H, keys and connections, and racks and power devices for moving them, and motors for moving them independently of the power, and a printing-recorder having wheels connected to be operated by the said racks, substantially as described.

41. The combination, with the sight-register H, keys and connections, and racks and power devices for moving them, and motors for moving the racks independently of the power, and a recorder having wheels, and connections whereby said recorder is operated by the said racks, substantially as described.

42. The combination of the shaft C, registers H, recorder J, rack-levers I, and B, and yielding connections between the levers, substantially as described.

43. The combination, with the register H, recorder J, and a device for turning some of the wheels of the recorder, of rack-levers B I, and yielding connections between the same, substantially as described.

44. The combination, with the recording-wheels, register-wheels detents, and connections, of an adjustable support for the register-wheels, and an operating-lever, O^3, and intermediate devices whereby the movement of the lever serves to throw the register in and out of operation with the connections, substantially as described.

45. The combination, with the register-wheels A, pins w, and operating-racks, and means for throwing the racks and wheels into and out of connection, of detents F, hung to fixed supports and provided with bearings for the racks, and with inclined edges and shoulders for engaging the pins w, substantially as described.

46. The combination, with the register H and actuating devices and automatic appliances for throwing them into and out of gear, and hand appliances for also throwing them into and out of gear, substantially as described.

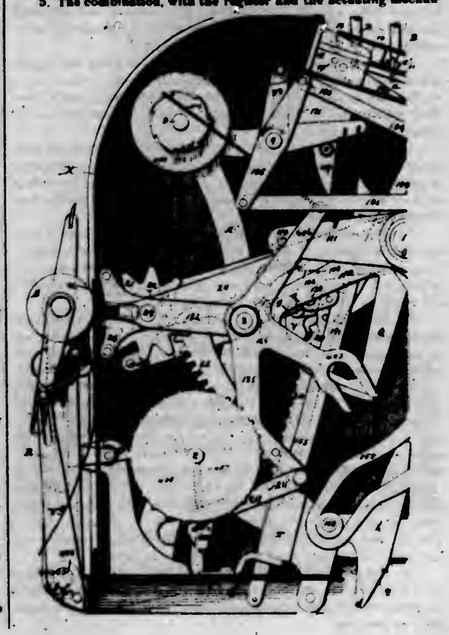
47. The combination, in a mechanical calculator, of series of keys and connections between each series of keys, and a regulator having a series of stops, whereby the latter may be set by the keys to determine the positions to which the parts shall be subsequently moved to set the register, substantially as described.

48. The combination of series of keys, stops, and their connections, a register, and devices which are brought against the stops to set the register, and a restoring device whereby all the keys may be set to their normal positions before the register is moved, substantially as described.

49. The combination of the keys, independent levers, stops, and connections between the levers and stops, and devices whereby the levers may all be brought to their normal positions after being set by the keys, substantially as described.

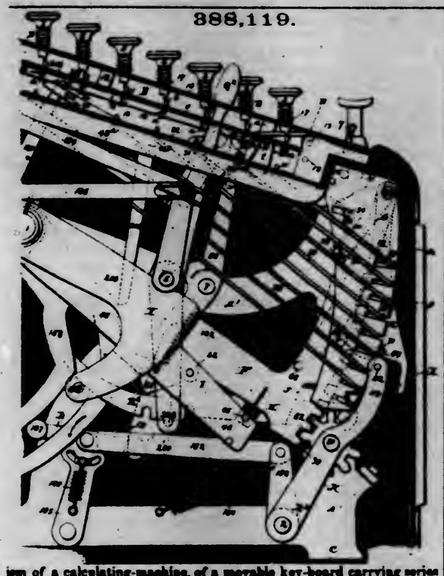
50. The combination, with the keys, stops, registers, and actuating devices, of a key, W, arranged upon the key-board and connected with the stops to reset the same, substantially as described.

388,119. CALCULATING-MACHINE. WILLIAM S. BURROUGHS, St. Louis, Mo., assignor to the American Arithmometer Company, same place. Filed Nov. 30, 1887. Serial No. 256,868. (No model.)



Claims.—1. The combination, with the register and register-actuating devices of a calculator, of a key-board capable of movement and provided with a series of adjustable keys, and movably supported upon the frame of the machine to bring the keys that have been set into operative connection with the register-actuating devices upon the movement of the board after such setting of the keys, substantially as described.

2. The combination, in a calculating-machine, of a series of register-wheels, wheel-actuating devices, a frame supporting the same, a movable key-board mounted to have a limited movement on the frame, and a series of adjustable keys carried by said key-board, whereby such keys as are set by hand are brought into connection with the wheel-actuating devices on the movement of the key-board after such setting of the keys, substantially as described.



3. The combination, with the register, actuating-levers F, and stops limiting the movements of said levers, of a movable key-board carrying series of adjustable keys, and connections between each stop, and one of the keys arranged to be operated by such key after it is set and upon the movement of the board, substantially as described.

4. The combination, with the register, the retainers, the operating-levers, and the regulators thereof, of a movable key-board carrying series of keys, and connections between each series of keys and one of the retainers, and connections between each key and a stop of the corresponding regulator, the latter connections arranged in position to be actuated only by the keys that are set and on the movement of the board, substantially as described.

5. The combination, with the register and the actuating mechan-

388,119.

ism of a calculating-machine, of a movable key-board carrying series of adjustable operating-keys, substantially as and for the purpose set forth.

6. The combination, with the register-actuating levers F and a retainer for each lever, of a movable key-board, series of keys carried thereby, movable studs arranged to contact with such keys as have been set, and a connection between the studs of each series of keys and the retainer of the co-operating lever F, substantially as described.

7. The combination, with the register-actuating devices, of a movable key-board and series of keys adjustably carried thereby to contact with said devices upon the movement of the board after the adjustment of the keys, substantially as described.

8. The combination, with the frame of the machine, register, and register-actuating devices, of a key-board sliding on said frame, and series of keys adjustably mounted upon said board, and adjustable into and out of operative relation to said devices, substantially as described.

9. The combination, in a calculating-machine, with the register and actuating devices, of the sliding key-board, series of keys, and a locking-slide to each series to hold the keys after being set in operative relation to the register-actuating devices, substantially as described.

10. The combination, with a series of keys, each having a bearing or shoulder, of a locking-slide arranged to be moved by the setting of any of the keys, and adapted to engage all of said shoulders to hold any key after it is set and until moved by the setting of another key, substantially as described.

11. The combination of a series of spring-actuated keys, a locking-slide and spring for moving the same, and a shoulder and an incline on each key, the incline arranged to bear on and force back the slide as a key is depressed until said slide engages with the shoulder and locks the key, substantially as described.

12. The combination of the movable key-board, series of keys, locking devices for holding the keys in position after they are set, and an automatic unlocking device for replacing the keys as the key-board is restored to its normal position, substantially as described.

13. The combination, with the rack-levers having bearings, of a series of pinions having studs, a swinging frame carrying said pinions a pawl with two shoulders, one engaging with a stud on one of the pinions, a spring-actuated lever, L, with which the other shoulder engages, and detents M engaging with the bearings on the rack-levers, and in position to contact with the levers L, substantially as described.

14. The combination, with the rack-levers and detents affording bearings therefor, of striking-levers L, pawls for holding said striking-levers out of contact with the detents, and a series of pinions gearing with the rack-levers, and each provided with a stop arranged to contact with the adjacent pawl, substantially as described.

15. The combination, with the rack-levers, actuating automatic motors and detents, and keys and register of a mechanical calculator, of spring-actuating striking-levers for operating said detents, substantially as described.

16. The combination, in a mechanical calculator having a rack-lever, keys, and a register, and with a detent for restraining the movement of the rack-lever, of a striking-lever, a detent for holding it back, and releasing mechanism, substantially as described.

17. The combination, with the rack-levers and the carrying-pinions, of detents affording bearings for said levers, striking-levers, and actuating-springs, pawls for normally holding the striking-levers out of contact with said detents, and studs on the pinions arranged to contact with the pawls, substantially as described.

18. The combination, with the detents, the striking-levers, springs, and pawls for holding the levers away from the detents, of studded pinions for moving the pawls to release the striking-levers, and a movable resetting-bar arranged to contact with all of said levers, substantially as described.

19. The combination, in a calculating-machine having register-wheels, of levers F, each consisting of two sections jointed to permit a limited play of one in respect to the other, the rear section in gear with the wheels of the register, a spring tending to maintain a bearing of one section against a bearing of the other, a movable bar for swinging the rear sections to carry the bearings out of contact, and a lifter provided with motor-springs for operating the forward sections of the levers, substantially as described.

20. The combination, with the register and jointed rack-operating levers F of a calculating-machine, of pivoted side arms carrying a cross-bar, 45, for elevating the front ends of the levers, and also carrying a cross-bar, 110, for depressing the rear sections of the levers, substantially as described.

21. The combination, with a mechanical calculator having a movable key-board and with an operating-driver, T, of a detent for holding the driver in an inoperative position, and connections between the detent and the movable key-board, whereby the detent is displaced as the key-board is moved after setting its keys, substantially as set forth.

22. The combination, with the registers, pinions 60, frame K, and reciprocating cam *k*, of a rod, 162, a lever, *k*, pivoted thereto, and a spring for holding it in its normal position, a movable arm, Q, and the arm 171, provided with lugs 170 200, adapted to be brought, respectively, below and above one end of the lever, according to the position of said arm, substantially as set forth.

23. The combination, with the keys, register-wheels, and rack-levers F, of a movable frame carrying a series of pinions, 60, intermediate frame-adjusting devices, and a lever, Q^3, connected with the adjusting devices of said frame to regulate the position of the frame, substantially as set forth.

24. The combination, in a calculating-machine and with the register, operating devices, keys, and movable key-board carrying said keys, of a lock holding said key-board in place, and connections between the lock and a movable part of the machine for holding the lock in place until all parts of the machine are in their normal position, substantially as set forth.

25. The combination, with a calculating-machine, its actuating-lever, driver, and parts carried therewith, of a pawl bearing on one of the moving parts to permit a return movement after a movement is begun in either direction, and devices, substantially as described, for reversing the pawl and throwing it out of retaining action at the limit of each movement, substantially as described.

26. The combination, with a calculating-machine having keys and a register and intermediate connections, of a driver, a reciprocating rack connected with the driver and having shallow teeth or notches along its length and deeper notches at the ends, and a reversible pawl adapted to said rack, substantially as set forth.

27. The combination, with keys, registers, intermediate connections, and the operating-driver of a calculating-machine, of a spring connected to move the driver in one direction, a treadle to move the driver in the opposite direction, and intermediate yielding spring-connections between the treadle and driver, substantially as set forth.

28. The combination, with the calculating-machine having keys, a register, connections, and an operating-treadle and motor, of a detent for locking the treadle in its position after the power is stored in the motor, and detent-releasing devices, whereby the detent is withdrawn when the motor power is required, substantially as set forth.

388,120. SULKY-PLOW. Squire M. Campbell, Urbana, Ill. Filed June 11, 1888. Serial No. 276,682. (No model.)

Claim.—1. In a wheel-plow, the combination, with the frame and the tongue pivoted to swing horizontally, of a connection between said tongue and the lever for regulating the depth of the plow, whereby said lever will be moved by the horizontal movement of the tongue, substantially as described.

2. In a wheel-plow, the combination, with the frame and the tongue pivoted to swing horizontally, of a connection between said tongue and the lever for regulating the depth of the plow, whereby the lever will be moved to normal position by the horizontal movement of the tongue, and a trip for releasing said lever to permit of the independent movement of the plow, substantially as described.

3. In a wheel-plow, the combination, with the frame, the plow pivoted thereto, and the lever controlling its vertical movements, of the tongue pivoted to the frame to swing horizontally thereon, and a connection between the tongue and lever, whereby the plow will be moved by the horizontal movement of the tongue, substantially as described.

4. In a wheel-plow, the combination, with the frame, the plow pivoted thereto, the lever controlling its movements, and the rear wheel mounted in bearings to swing vertically, of the tongue pivoted to the frame to swing horizontally, and connections between the tongue and lever and lever and rear wheel, whereby the depth of the plow will be regulated by the horizontal movement of the tongue, substantially as described.

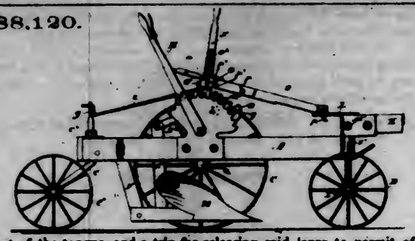
5. In a wheel-plow, the combination, with the frame, the plow pivoted thereto, and the lever controlling its vertical movements, of the tongue pivoted to the frame to swing horizontally, a connection between the tongue and lever, whereby the plow will be moved to normal position by the horizontal movement of the tongue, and a trip for releasing said lever to permit of the independent movement of the plow, substantially as described.

6. In a wheel-plow, the combination, with the frame, the plow pivoted thereto, the lever controlling its movements, and the rear wheel mounted in bearings to swing vertically, of the tongue pivoted to the frame to swing horizontally, connections between the tongue and lever and lever and rear wheel, whereby the depth of the plow will be regulated by the horizontal movement of the tongue, and a trip for releasing the connection between the tongue and lever for permitting the independent adjustment of the plow, substantially as described.

7. In a wheel-plow, the combination, with the frame and plow and the lever for regulating the depth of the plow, pivoted to the frame, of the tongue pivoted to the frame to swing horizontally, a connecting rod or link pivoted to the tongue, a catch thereon for automatically engaging the lever to carry it to normal position when the tongue is moved horizontally and permit its release for independent adjustment, and an adjustable stop for limiting the movement of the lever when so released, substantially as described.

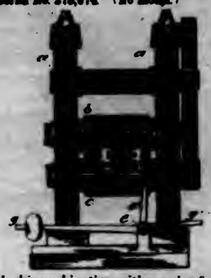
8. In a wheel-plow, the combination, with the frame, the plow, the lever for regulating the depth of the same, and the tongue pivoted to the frame to move horizontally, of a connecting rod or link pivoted to the tongue and engaging the lever, and a lever pivoted to said connecting-rod, also engaging said first-mentioned lever and forming a toggle to return the plow to normal position when the connecting-rod is disengaged to permit a slight downward movement of the plow, substantially as described.

9. In a wheel-plow, the combination, with the frame, the plow, the lever for regulating the depth of the same, and the tongue pivoted to the frame to move horizontally, of a connecting rod or link uniting the tongue and lever, and an adjustable connection between the connecting-rod and tongue for regulating the extent of movement of the same, substantially as described.



10. In a wheel-plow, the combination, with the frame, the plow, the lever for regulating the depth of the same, and the tongue pivoted to the frame to move horizontally, of the adjustable plate moved by the tongue and the connecting-rod or pitman connecting said plate and lever, as and for the purpose set forth.

11. In a wheel-plow, the combination, with the frame, the plow, the lever for regulating the depth of the same, and the tongue pivoted to the frame to move horizontally, of the adjustable plate moved by the tongue, the connecting-rod or pitman connecting said plate and lever, and an adjustable connection between said rod and plate, substantially as described.



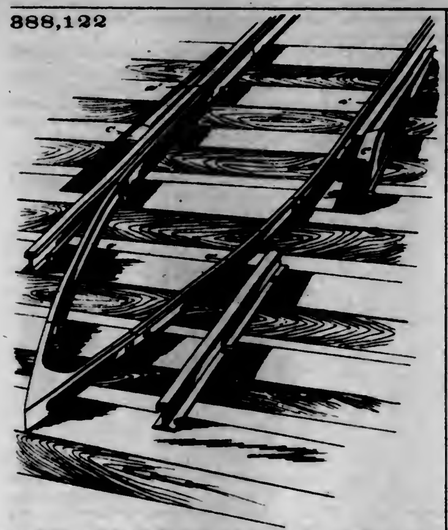
12. In a wheel-plow, the combination, with the frame, the plow, the lever for regulating the depth of the same, having the two stops or pins thereon, and the tongue pivoted to the frame to move horizontally, of a connecting-rod pivoted to the tongue and engaging the forward stop or pin on the lever to adjust the lever, and resting on the rear pin when the lever is thrown forward to prevent its engagement in a direction to cause the further forward movement of the lever, substantially as described.

13. In a wheel-plow, the combination, with the frame, the plow and beam relatively stationary, the plow-beam pivotally connected to said frame to swing vertically, and a lever controlling its vertical movements, of the tongue pivoted to swing horizontally, and a connection between the tongue and lever, whereby the plow will be moved by the horizontal movement of the tongue, substantially as described.

388,120.

388,121. GUIDE FOR ROLLING-MILLS. Lewis Chapman, Colinsville, Conn., assignor to The Collins Company, same place. Filed May 31, 1888. Serial No. 275,674. (No model.)

Claim.—1. In combination with a pair of rolls, the fixed guide located adjacent to the rolls and in a plane passing between the adjacent faces of the rolls, and the adjustable guide borne on an arm rising from a rock-shaft held in bearings adjacent to the rolls, all substantially as described.



2. The combination, with a pair of rolls, of the fixed guide located adjacent to the rolls and in a plane passing between the adjacent faces of the rolls, the rock-shaft pivoted in bearings adjacent to the rolls and having an upright arm with a transverse socket in which is clamped a shank projecting from the movable guide, the movable guide having a shank, the head-block pivoted to the body of the guide and vertically adjustable on the shank, the head-block having a head-piece with a socket in the face, all substantially as described.

388,122. SAFETY-GUARD FOR RAILROAD-BRIDGES. James B. Collins, New York, N. Y., assignor to William J. Harden, Chicago, Ill. Filed Mar. 21, 1888. Serial No. 267,949. (No model.)

Claim.—1. In a safety-guard for railroad-bridges, the combination, with the bridge and the track laid upon it, of a pair of parallel

388,122

guards arranged beside the track and having their ends flared apart and provided with posts or stops in line with the sides of the bridge, substantially as shown and described, and for the purpose set forth.

2. The combination, with the bridge and the main-track rails, of the side guards, *b*, provided with flared ends *b'* and posts or stops *b²*, and the rerailing-plates *c* and their guard-rails *c'*, meeting at the center of the track, substantially as and for the purpose set forth.

388,123. COAT. MAX COHEN, New York, N. Y. Filed June 21, 1888. Serial No. 277,760. (No model.)

Claim.—As an improved article of manufacture, a coat having a shoulder-lining composed of a yoke, C, adapted to the back, the shoulders, and front parts of the coat, in combination with the free depending strap *d* at the back of the coat-yoke, the free depending straps *d' d'* at the front of this yoke, the arches *e e*, the horizontal stitching *g g g*, and the oblique shoulder-stitching *i i*, the upper edge of said yoke being stitched to the collar *a*, and the sides to the body of the coat, as set forth.

388,124. MILK-BOX. EDWARD J. COLBY, Chicago, Ill. Filed Sept. 5, 1887. Serial No. 248,793. (No model.)

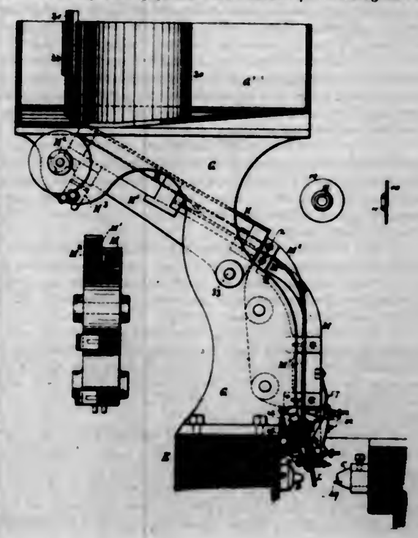
Claim.—1. In a milk-box, the combination of the box having a hinged door and lock and a hinged lid with ledges secured along the top of said box, funnels which are suspended from said ledges and apertures in the top of said box which open into said funnels.

2. In a milk-box, a registering-scale consisting of a circle of indicating-marks, a circle of apertures, and an internal hand or arm which may be made to register with any one of said apertures to indicate the quantity of cream or milk desired.

388,125. CORKSCREW. LEROY W. FAIRCHILD, New York, N. Y. Filed Apr. 26, 1888. Serial No. 272,181. (No model.)

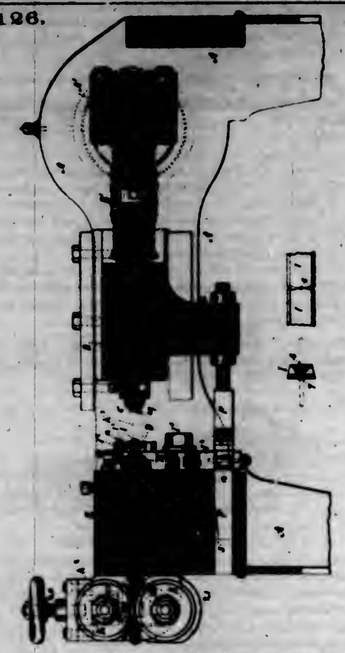
Claim.—1. The combination, in a corkscrew, of the tube A, provided with the slots *h* and *f* for the shank of the screw B, and the slot *g* at the side for the guide-pin *e*, with the yoke C, provided with the guide-pin *e*, and having the screw B pivoted thereto, as shown, whereby the shank of said screw is made to project through the slot *h* when turned into position for use, substantially as shown and described.

2. In combination with the tube A, provided with the slots *f*, *g*, and *h*, the yoke C, provided with the guide-pin *e*, and having the screw B pivoted thereto, and the spring *t*, connected at one end to the yoke C and at its opposite end to the end of tube A, or to the interior of the handle in any equivalent manner, whereby the screw B will be drawn back within the case or handle, as set forth.



3. The combination of the slotted tube A, having the sliding yoke with the shank of the screw B pivoted thereto, so that its end *n* shall project through the slot *h* and above the wall of tube A, with the cap I, secured rigidly on the tube A, and the detachable cap I', arranged to screw onto the opposite end of tube A, and thereby clamp the shank of the screw B between it and the adjoining end of tube I, substantially as shown and described.

4. A pocket-corkscrew consisting of a tubular handle, a sliding yoke having the screws pivoted thereto, and a spring arranged to draw the yoke and screw back within the handle, and a detachable cap for closing the handle, all constructed and arranged to operate substantially as shown and described.



5. The combination, in a corkscrew, of the slotted tube A, with the sliding screw B therein, and having the cap I fastened on one end, with the detachable cap I', arranged to screw onto the opposite end and abut against the end of tube I, so as to cover and completely close all slots or openings in the implement when closed, substantially as shown and described.

388,126. MACHINE FOR MAKING DECORATIVE NAILS. HENRY P. FISKE, Waterbury, Conn., assignor to the American Ring Company, same place. Filed Sept. 28, 1887. Serial No. 250,472. (No model.)

Claim.—1. The combination, in a machine for making decorative nails, of a reciprocating gate and die, a tubular punch acting with the

388,126.

die to shape the sheet-metal head and close the metal around the end of the wire-nail shank, means for feeding the wire through the tubular punch, and cutters acting outside of and beyond the tubular punch for forming the point of the nail and separating the completed nail from the wire and forming the neck of the next nail-head, substantially as set forth.

2. The combination, in a decorative-nail machine, of grooved fingers between which the sheet-metal blank is supplied, a tubular punch and die for shaping the sheet-metal head, horizontally-actuated mechanism for moving the die, feeding mechanism for supplying the wire through the tubular punch, and cutters acting outside the tubular die for cutting off the finished nail and simultaneously forming the point and preparing the neck or head portion for the next nail, substantially as set forth.

3. In a machine for making decorative nails, the combination, with the die and tubular punch, of means for feeding the wire and cutters constructed as specified and acting outside of the tubular die for simultaneously separating the finished nail from the wire, forming the point thereof and a neck or head at the end of the wire for the next nail, substantially as set forth.

4. The combination, with the die and punch for forming the sheet-metal head and mechanism for reciprocating the die, of fingers grooved to receive the edges of the sheet-metal blank head and pivots for the fingers, upon which they can swing and open laterally to clear the die when forming the sheet-metal head, substantially as specified.

5. The combination, with the punch and die for forming sheet-metal nail-heads, of grooved fingers for holding the sheet-metal head-blank; pivots upon which the fingers swing in opening laterally to clear the die, and pivots upon which the fingers swing longitudinally of the machine as the die moves in forming up the sheet-metal head, substantially as set forth.

6. The combination, with the die and punch, of the fingers L, the gudgeon-bolts 40, and tubular stocks 41, forming pivots for the fingers, the stationary axis L', and the adjusting-cam, substantially as set forth.

7. The combination, with the pivoted swinging fingers and the springs for closing the same, of the dies for shaping the sheet-metal head and the incline 50, for opening the fingers as the parts are moved, substantially as set forth.

8. The combination, in a machine for making decorative nails, of an inclined feed-slide having a slot at the bottom and an opening at one side of the slot that allows the sheet-metal blank that is in proper position for the head-forming dies to pass away to the fingers and to separate from the blanks that are not in the proper position, substantially as set forth.

9. The combination, with the fingers for receiving and supplying the blank and the head-forming dies, of a slide through which the blanks are supplied and an automatic escapement mechanism, substantially as described, for allowing one blank at a time to pass from the slide to the fingers and thence to the dies, substantially as set forth.

10. The feeding-pan having an opening in the bottom and a ring-30, and adjustable gate 31, in combination with the feed-slide H, for receiving the nail-head blanks, and the guide-bars for conveying the blanks to the heading mechanism, substantially as specified.

11. The combination, with the guide-bars for conveying the head-blanks and the dies for pressing up said blanks, of the escapement-lever I", having the prongs P for holding up the blanks between the guide-bars, and the swinging fingers slotted to receive the edges of the blanks, substantially as set forth.

12. The combination, with the dies for pressing up the nail-head, of the guide-bars for the blank heads, swinging fingers below the guide-bars for receiving the blanks and holding them on line with the dies, an escapement-lever to allow one blank at a time to pass down to the fingers, and a stop-pin on the escapement-lever for holding up the blank, substantially as specified.

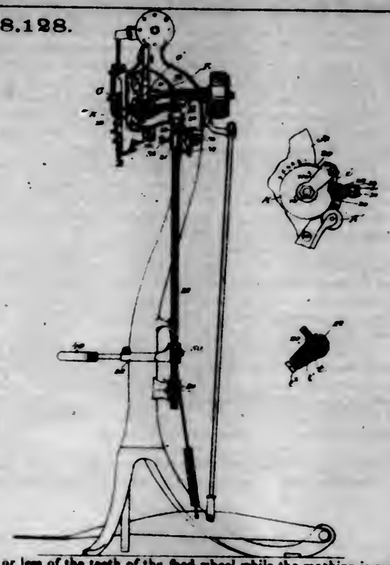
13. The combination, in a machine for making nails with ornamental sheet-metal heads, of dies for closing the cup of the sheet-metal head around the neck in the end of the wire, feeding mechanism, substantially as set forth, for feeding along the wire, and dies for cutting off and pointing the complete nail and simultaneously forming the neck for the next nail, substantially as set forth.

388,127. MACHINE FOR PRESSING CLOTH. DAVID OMMEN, Worcester, Mass. Filed June 6, 1888. Serial No. 276,053. (No model.)

Claim.—1. In combination, a cylinder, a jacket enveloping the same, two pressing devices co-operating with the cylinder, a moistening device arranged to moisten the jacket between the pressing devices, devices for guiding the cloth around said moistening device as it passes from one pressing device to the other, and a second moistening device arranged to moisten the cloth as it passes from one pressing device to the other, the last-mentioned moistening device being arranged to moisten the cloth upon the opposite side to that which comes in contact with the jacket.

2. In combination, the cylinder, the two pressing devices co-operating therewith, the jacket enveloping the cylinder, the moistening device for throwing moisture upon the jacket between the two pressing devices, and means whereby the cloth is guided around the said moistening device, substantially as described.

3. In combination, the cylinder, the two pressing devices co-operating therewith, means whereby the cloth is guided away from the cylinder as it passes from one pressing device to the other, and a moistener arranged within the loop of the cloth between the two pressing devices, whereby the cloth as it passes from one pressing device to the other is moistened upon the surface which comes next to the cylinder, substantially as described.



4. In combination, the cylinder, its co-operating pressing devices, means whereby the cloth is guided away from the cylinder as it passes from one pressing device to the other, and a moistening device arranged within the loop of the cloth between the pressing devices, substantially as described.

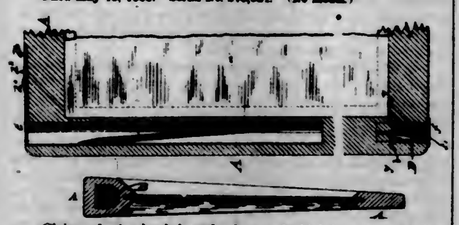
5. In combination, a cylinder, two co-operating pressing devices, means whereby the cloth is guided away from the cylinder as it passes from one pressing device to the other, a moistening device arranged within the loop of the cloth as it passes from one pressing device to the other, and a moistener arranged without said loop, whereby the said cloth as it passes from one pressing device to the other may be moistened upon both sides, substantially as described.

388,128. NAILING-MACHINE. LOUIS GOSSE, Winchester, assignor to James W. Brooks, Cambridge, principal trustee, and Frank F. Stanley, Boston, Mass., associate trustee. Filed Apr. 30, 1888. Serial No. 272,318. (No model.)

Claim.—1. In a nailing-machine, the feed-wheel K, the pawl-carrier, pawl to move it, the measuring-shield, the rod or shaft 22, and intermediate connections between it and the said shield, combined with the knee-lever vertically adjustable on the said shaft and under the control of the operator, and adapted to be readily moved to cover

388,128.

more or less of the teeth of the feed-wheel while the machine is running, to thus vary the length of the nail or fastening, as may be required.



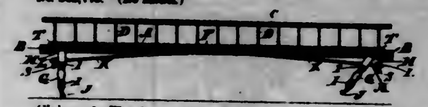
2. In a nailing-machine, the feed-wheel K, the pawl-carrier, pawl to move it, the measuring-shield, the rod or shaft 22, and intermediate connections between it and the said shield, combined with the knee-lever made in two parts, one adjustable on or with relation to the other and under the control of the operator, and carried by the said shaft, and adapted to be readily moved to cover more or less of the teeth of the feed-wheel while the machine is running, to thus vary the length of the nail or fastening, as may be required.

3. The feed-wheel, the shield 29, the lever 26, and the segmental gear 34, and adjustable stops 35 36, combined with the rock-shaft 22, and with means under the control of the leg of the operator to move the said rock-shaft, substantially as described.

4. In a nailing-machine, the rod or shaft 22, to control the feed of the wire, combined with the arm 42, adjustable thereon, and with the independent longitudinally-adjustable end piece carried thereby, substantially as described.

5. In a nailing-machine, the rod or shaft 22, to control the feed of the wire, and a leg, lever, or arm to actuate it, combined with a friction device composed of a block, spring, and screw to hold the said shaft in adjusted position, substantially as described.

388,129. SCHOOL-SLATE. JULIUS HACKENBERG, Passaic, N. J. Filed May 15, 1888. Serial No. 273,981. (No model.)



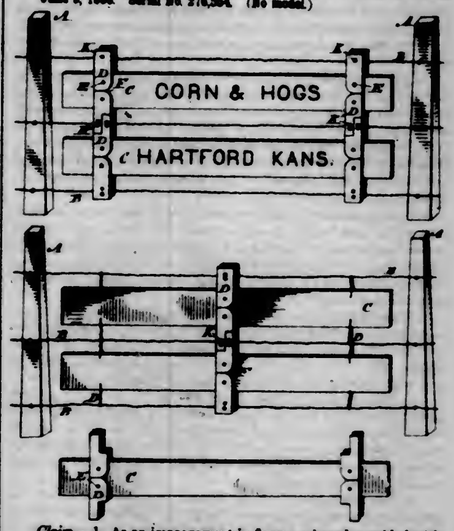
Claim.—1. A school-slate the frame of which is made thicker at one side and tapering toward its other side, and provided with a longitudinal receptacle in the thicker side and a sliding lid for said receptacle, substantially as set forth.

2. A school-slate the frame of which is made thicker at one side and tapering toward its other side, and provided with a longitudinal receptacle in the thickened portion and a slotted lid for the receptacle, said lid being guided along a fixed and headed stud of the frame, substantially as set forth.

3. A school-slate the frame of which is made thicker at one side and tapering toward the other side, and provided with a pencil-sharpening device secured into a socket in the thicker portion of the frame, substantially as set forth.

388,130. CRIB. PERRY C. HANSARD, Kenosha, Wis., assignor of one-half to Johnson A. Jackson, same place. Filed Feb. 2, 1888. Serial No. 262,773. (No model.)

Claim.—1. The frame of a crib or couch and the thereto-hinged legs G G, adapted to be held in position as legs by elastic brace-rods K K, in combination with the cross-bars L L, supported on brace-rods K K and bearing against the pins T T, and the casters S S, adapted to serve as feet for the crib when the legs are folded down upon the frame, substantially as described.



2. In a combined crib and bed provided with swinging legs, the combination of elastic stay-rods K K, provided with shoulders M M, in combination with pins O O, fixed in the legs G G, and the cam P, provided with flange R, substantially as described.

388,131. FOLDING HEAD-PIECE FOR COTS. PERRY C. HANSARD, Kenosha, Wis., assignor of one-half to Johnson A. Jackson, same place. Filed Feb. 2, 1888. Serial No. 262,776. (No model.)

Claim.—The combination of a cot and head-piece, bent staples connecting the head-piece and cot, the two tangs of the staple being partly driven into the frame of said cot at one side of said head-piece and embracing between them a spindle or upright of said head-piece, whereby the latter may be folded flat onto the cot or supported at a radial angle thereto, substantially as described.

388,132. FENCE. WILLIAM I. F. HARDEN, Hartford, Kans. Filed June 9, 1888. Serial No. 276,364. (No model.)

Claim.—1. As an improvement in fences, a board provided with pairs of pivoted cleats for securing it in open spaces between the parts of the fence, said cleats being adapted to fold on opposite sides of the board for convenient transportation and handling, substantially as set forth.

2. The combination, with the fixed wires or strips of a fence, of a series of boards fitted together by a succession of pivoted cleats adapted to fold on opposite sides of the boards, and serving to attach them to the fence, substantially as set forth.

388,133. CLEANER FOR GUN-BARRELS. JAMES HASTINGS, Torrington, Conn., assignor to the Union Hardware Company, same place. Filed June 11, 1888. Serial No. 276,749. (No model.)

388,133.

Claim.—1. A cleaner for gun-barrels and other tubes, consisting of a brush of wire bristles pivotally secured between their ends to a shank adapted for holding the same and for attachment to a cleaning-rod, said bristles being arranged side by side and forming a circular brush around the shank, all combined substantially as specified.

2. A gun or tube cleaner composed of the shank *a*, having a groove about its end, in combination with a brush of bristles adapted to surround the shank and be received in its concave end, and a ring for surrounding the bristles and for holding said bristles to said shank, substantially as set forth.

3. A gun or tube cleaner composed of the shank *a*, adapted to be attached to a cleaning-rod at one end and having a circumferential groove at the other end, a brush or cleaner composed of wire bristles *c*, each of which bristles is centrally looped or recessed and adapted to fit into the groove of the shank, and whose arms are bent at an obtuse angle to each other, and whose ends are pointed, and a ring, *d*, encircling the brush of bristles at their central loop or recess to hold the same in place upon the shank and permit a seesaw motion to said bristles, substantially as set forth.

4. The combination, with the shank *a*, adapted to be secured to a cleaning-rod and having a shoulder, 3, grooved end 4, and stem 5, of a ring, *b*, having a grooved end adapted to fit upon and be secured to the stem 5, the brush of wire bristles *c*, centrally looped or recessed at 6 and fitting around the shank in a solid mass, the arms of which bristles are at an obtuse angle to each other and pointed, and an encircling ring, *d*, which forms a loose joint, but secures the brush of wire bristles to the shank *a*, substantially as set forth.

5. A gun or tube cleaner composed of the shank *a*, adapted to be attached to a cleaning-rod at one end and having a circumferential groove at the other end, a brush or cleaner composed of wire bristles *c*, each of which bristles is centrally looped or recessed and adapted to fit into the groove of the shank, and whose arms are bent at an obtuse angle to each other, and whose ends are pointed, and a ring, *d*, encircling the brush of bristles at their central loop or recess to hold the same in place upon the shank, and a ring, *f*, surrounding the brush of bristles and adapted to move endwise upon the same, substantially as specified.

388,134. BOOT OR SHOE. WILLIAM T. HOOKER, London, England. Filed Jan. 5, 1888. Serial No. 259,992. (No model.) Patented in England Jan. 20, 1888, No. 1,069.

Claim.—The herein-described boot or shoe, provided with a fly or flap having a scalloped or serrated edge, *c*, the scallops or serrations of the said fly or flap being projected on lines of different inclinations to the edge of the fly or flap, substantially as described.

388,135. ROTARY TRACK-CROSSING. FRED J. HOYT, Chicago, Ill., assignor to the Hoyt Railroad Track Crossing Company, same place. Filed Mar. 20, 1888. Serial No. 268,207. (No model.)

Claim.—1. A rotary track-crossing provided on its face or faces with a rail placed to form a close and continuous connection with the rail of a main or branch track, in combination with a switch-lever mechanism and a locking mechanism to automatically lock the crossing in position when turned, substantially as described.

2. In combination with the rotary track-crossing having a longitudinal shaft, the locking device composed of a spring-bar adapted to enter the end of the said shaft, mechanism for turning said crossing,

and lever mechanism connected to said bar and the switch, whereby when the crossing is turned the same is automatically locked in place, substantially as described.

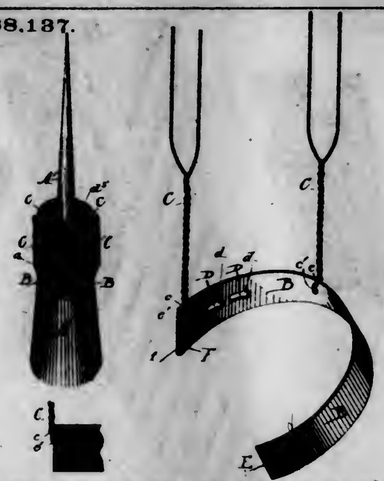
3. In combination with a rotary track-crossing, a spring-lock, lever mechanism for operating said lock, and a switch-stand provided with a latch to engage with the lock-lever, whereby, when the lock is released, it is held disengaged until the crossing is turned, substantially as described.

4. The T-bar, the lever mechanism for releasing said bar, in combination with a rotary crossing provided with a longitudinal shaft having recesses cut into one end thereof, and a spring or springs secured to said shaft and bar to draw the bar within the said recesses of the shaft, substantially as described.

5. In combination with a rotary track-crossing, switch-stand, and lever mechanism, a lock, and mechanism for operating said lock, consisting of the vertical rod V, handle V', in connection with a lug, *s*, in the switch-pulley, and pulleys for the cable connecting the lock and its lever mechanism, substantially as described.

388,136. DUST-GUARD FOR AXLE-BOXES. JOHN W. HYATT, Newark, N. J. Filed Apr. 27, 1888. Serial No. 272,041. (No model.)

Claim.—1. In an axle-bearing, the channel E, supplied with loose metallic shot to fit closely about the axle, as and for the purpose set forth.



2. The combination, with an axle-bearing, of a collar applied to the end of the bearing and provided with the channel E, supplied with loose metallic shot, substantially as herein set forth.

3. In an axle-bearing consisting in a shell containing anti-friction rollers, the combination, with such shell, of the channel E, provided with loose metallic shot, and the apertures F, extending from the channel within the shell to drain the oil thereto, substantially as set forth.

388,137. BRUSH. RICHARD W. ILIFF, Hinsdale, Ill. Filed Feb. 28, 1887. Serial No. 228,614. (Model.)

Claim.—The improved bridle for paint-brushes herein described

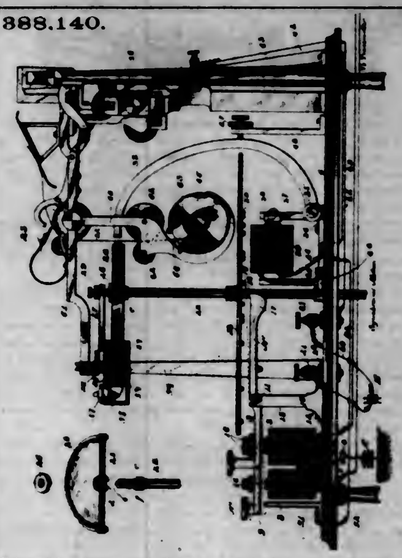
388,137.

and shown, comprising the flexible band B, having its ends adjustably connected, one of the ends having an upturned flap, F, forming a seat, *f*, for the other end, the band being further provided with vertically-aligned openings *c c'*, and the flexible wires passed outward through said openings and twisted above the same, as specified.

388,138. LETTER-SCALE AND COIN-TESTER. Edgar Kinsey, Saybrook, Conn. Filed Sept. 2, 1887. Serial No. 248,568. (No model.)

Claim.—In weighing-scales, the combination of the plate A, constituting the scale-beam, and pivoted or fulcrumed at one edge between its ends to the suspending-clip C, and provided with the weight B and the clip C^3 at opposite ends of said beam, respectively, and having a graduated scale, one or more, in the form of the arc of a circle of which the fulcrum is the center on its side face, as described, with a pointer, D, constituted by an extension of the suspending-clip over the side face of the beam, and adapted to range over the graduated scale, as and for the purpose specified.

388,139. COTTON-CHOPPER. Clark T. McIntosh, Dadeville, Ala. Filed May 29, 1888. Serial No. 275,461. (No model.)



Claim.—In a cotton-chopper, the axle *d*, with gear-wheels C, and the shaft *e*, with pinion *f* and pulley *g*, in combination with the shaft *h*, having pulley i and bolt A, and the hoes D, connected to said shaft, the adjustable hanger F, in which the shaft has its bearings, and the plow and standards connected to the hanger, substantially as and for the purpose set forth.

388,140. ELECTRICAL TYPE-WRITER. James F. McLaughlin, Philadelphia, Pa. Filed Aug. 24, 1887. Serial No. 247,704. (No model.)

Claim.—1. An electrical type-writer comprising a series of circuit-controlling key-levers, a current-conducting revolving disk provided with a series of stops arrested by the movement of any key-lever, and an electric circuit including said key-levers and disk operated by the movement of any key-lever.

2. An electrical type-writer comprising a series of circuit-controlling key-levers, a revolving current-conducting disk provided with a series of stops and arranged to be arrested in its rotation by a movement of any one of said key-levers, an electric circuit including said

388,140.

disk and key-levers, and electro-magnetic letter-spacing mechanism, substantially as described, also included in and controlled by said electric circuit.

3. An electrical type-writer comprising a series of circuit-controlling key-levers, a revolving current-conducting disk provided with a series of stops and arranged to be arrested in its rotation by a movement of any key-lever, an electric circuit including said key-levers and disk, electro-magnetic printing mechanism, substantially as described, included in and controlled by said electric circuit, and electro-magnetic letter-spacing mechanism, substantially as described, also included in said electric circuit and arranged to be operated thereby at a determinate instant after the printing mechanism.

4. An electrical type-writer comprising a series of pivoted armature key-levers, electro-magnets for attracting said key-levers, and a revolving disk provided with stops arrested by the attraction of any key-lever, as specified.

5. An electrical type-writer comprising a series of pivoted armature key-levers, electro-magnets for attracting said key-levers, circuit-closing mechanism for directing the current through a particular magnet, and a revolving disk provided with stops arrested by the attraction of any key-lever.

6. An electrical type-writer comprising a series of pivoted armature key-levers and electro-magnets for attracting said key-levers and a main-line circuit severally including said electro-magnets, in combination with a transmitter provided with circuit-closing keys for directing the current through a particular actuating electro-magnet and a local circuit operated by the movement of any of said key-levers, as specified.

7. An electrical type-writer comprising a series of pivoted armature key-levers, electro-magnets for attracting said key-levers, and a revolving stop wheel or disk arrested by the actuation of any key-lever, in combination with a series of circuit-closing keys for directing the current through a particular magnet, as specified.

8. An electrical type-writer comprising a series of pivoted armature key-levers, electro-magnets for attracting said key-levers, a revolving stop disk or wheel arrested by the attraction of any key-lever, and a local circuit operated also by any movement of said key-levers.

9. An electrical type-writer comprising a series of pivoted armature key-levers, electro-magnets for attracting said key-levers, a revolving stop current-conducting disk or wheel arrested by the attraction of any key-lever, and a local circuit operated also by any movement of said armature key-levers, in combination with a transmitter provided with a series of circuit-closing keys for directing the current through a particular electro-magnet, as specified.

10. In an electrical type-writer, a series of current-conducting pivoted key-levers, each included in an electric circuit, a revolving current-conducting disk, also included in said electric circuit and provided with a series of spirally and relatively arranged stops, an electric circuit, and a suitable source of electricity, the whole being arranged so that the movement of any key-lever will cause its engagement with its corresponding stop and will simultaneously effect the operation of an electrical circuit by electrical contact with said stops, as specified.

11. An electrical type-writer comprising a series of pivoted armature key-levers having their rear extremities terminating in the same vertical plane, electro-magnets for actuating said key-levers, a revolving disk provided with a series of spirally and relatively arranged stops, circuit-closing mechanism for said magnets, the circuit, and a suitable source of electricity, the whole being arranged so that the separate energization of all the magnets will cause a separate movement of all the key-levers, a separate engagement thereof with a single and different stop, and the separate arrestation of the said revolving disk, as specified.

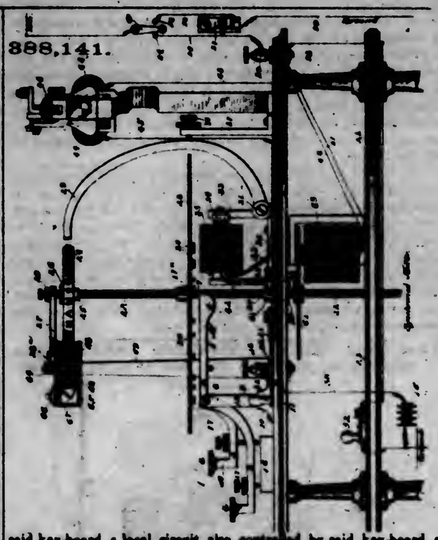
12. An electrical type-writer comprising a series of pivoted armature key-levers having their rear extremities terminating in the same vertical plane and each provided with an automatic retracting agency, electro-magnets for actuating said key-levers, a revolving disk provided with a series of spirally and relatively arranged stops, circuit-closing mechanism for said magnets, and the circuit and a suitable source of electricity, the whole being arranged so that the separate energization of all the magnets will cause a separate movement of all the key-levers, a separate engagement thereof with a single and different stop, and the separate arrestation of the said revolving disk, as specified.

13. In an electrical type-writer, the combination, with a series of pivoted current-conducting key-levers, each included in an electric circuit, and carrying each a symbol of the key-board, of a revolving current-conducting disk, also included in said electric circuit and provided with a series of spirally and relatively arranged stops, each stop corresponding to one or more symbols of the key-board, and a type-wheel revolving in unison with the stop-disk and provided with a series of type-letters circularly and relatively disposed around the periphery thereof, each type-letter corresponding to one of the symbols of the key-board and to one or more escapements on the disk, as specified.

14. In an electrical type-writer, the combination, with a series of pivoted armature key-levers carrying each a symbol of the key-board, electro-magnets for actuating said key-levers, a main-line circuit severally including said electro-magnets, and circuit-closing mechanism for directing a current through a particular magnet, of a revolving disk provided with a series of spirally and relatively arranged stops, each stop corresponding to one or more symbols of the key-board, and a type-wheel revolving in unison with the stop-disk and provided with a series of type-letters circularly and relatively disposed around the periphery thereof, each type-letter corresponding to one of the symbols of the key-board and to one or more stops on the disk, as specified.

15. In an electrical type-writer, the combination, with a series of current-conducting pivoted key-levers each included in a local electric circuit, of a revolving current-conducting disk, also included in said local circuit and arrested by the movement of any key-lever, a local circuit, the electrical connections, an electro-magnet and armature included in said local circuit, and a pivoted impact-lever operated by said armature.

16. In an electrical type-writer, the combination, with a series of pivoted current-conducting key-levers each included in a local circuit and carrying a symbol of the key-board, of a revolving current-conducting disk, also included in said local circuit and provided with a series of spirally and relatively arranged stops, each stop corresponding to one or more symbols of the key-board, a type-wheel revolving in unison with said disk and provided with a series of type-letters circularly and relatively disposed around its periphery, each type-letter corresponding to one of the symbols of the key-board and to one or more of the stops on the disk, a local circuit, electro-mechanical devices included in said circuit, a pivoted impact-lever provided with a retracting agency operated by said devices, and a traveling paper-feeding mechanism, as specified.



17. The combination, with the series of current-conducting pivoted key-levers included in a local circuit, of a revolving current-conducting disk, the local circuit, a magnet and its armature included in said circuit, and a pivoted impact-lever operated by said armature and provided with a retracting agency, a type-wheel revolving in unison with the disk and arranged to be arrested simultaneously therewith, a traveling paper-feeding mechanism, and an inking-roller normally in contact with said wheel.

18. The combination, with a circuit-controlling armature spacing-key lever, of an electro-magnet controlling the movement of said spacing-lever, and a local circuit including spacing mechanism controlled by said spacing-lever, whereby the spacing mechanism may be operated by a mechanical and electro-magnetic actuation of the spacing-lever.

388,141. ELECTRICAL TYPE-WRITER. James F. McLaughlin, Philadelphia, Pa. Filed Sept. 13, 1887. Serial No. 249,784. (No model.)

Claim.—1. An electrical type-writer comprising a circuit-controlling key-board, a current-conducting revolving stop-disk controlled by

388,141.

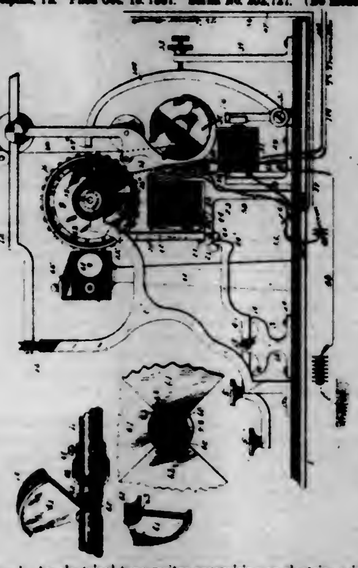
said key-board, a local circuit also controlled by said key-board, a main-line circuit, and switches and connections for connecting and disconnecting the main and local circuits.

2. An electrical type-writer comprising a circuit-controlling key-board, a current-conducting revolving stop-disk controlled by said key-board, a local circuit including printing mechanism, and also controlled by said key-board, a main-line circuit, and switches and connections for connecting and disconnecting the main and local circuits.

3. An electrical type-writer comprising a series of circuit-controlling key-levers, a current-conducting disk provided with a series of stops and arranged to be arrested by the movement of any key-lever, an electric circuit including said key-levers and disk, and operated also by a movement of any key-lever, an electro-magnetic unison-brake, also included in said electric circuit, and a revolving armature-disk controlled by said brake.

4. An electrical type-writer comprising a circuit-controlling key-board, a current-conducting revolving stop-disk controlled by said key-board, a local circuit including letter-spacing mechanism and also controlled by said key-board, a main-line circuit, and switches and connections for connecting and disconnecting the main and local circuits.

5. An electrical type-writer comprising a series of circuit-controlling key-levers, a revolving current-conducting disk provided with a series of stops and arranged to be arrested in its rotation by a movement of any key-lever, an electric circuit including said key-lever and disk, and operated also by a movement of any key-lever, electro-magnetic printing mechanism, substantially as described, included in and controlled by said electric circuit, an electro-magnetic unison-brake, also included in and controlled by said electric circuit, a revolving armature-disk controlled by said brake, and electro-magnetic spacing mechanism, substantially as described, also included in said electric circuit and arranged to be operated at a determinate instant after the operation of the printing mechanism.



6. In a printing-telegraph, two or more instruments located, respectively, at two or more stations of a line-circuit, and each comprising, essentially, a series of circuit-controlling key-levers, a rotary current-conducting disk and type-wheel upon a common shaft, an electro-magnetically-actuated printing-lever, an electro-magnetic unison-brake controlling the rotation of said shaft, and electro-magnetic spacing mechanism, substantially as described, in combination with a line-circuit, including said key-levers, disk, and the actuating electro-magnets of the brake, printing-lever, and spacing mechanism, and a synchronal motor for revolving the shafts of the respective instruments.

7. In a printing-telegraph, two or more instruments located, respectively, at two or more stations of a line-circuit, and each comprising, essentially, a series of circuit-controlling key-levers, a rotary current-conducting disk and type-wheel upon a common shaft, an electro-magnetically-actuated printing-lever, an electro-magnetic unison-brake controlling the rotation of said shaft, and electro-magnetic spacing mechanism, substantially as described, in combination with a line-circuit, including said key-levers, disk, and the actuating electro-magnets of the brake, printing-lever, and spacing mechanism, a synchronal motor for revolving the shafts of the respective instruments, switches, annunciators, and circuit-connections for the line-circuit.

8. In a printing-telegraph, two instruments located, respectively, at two stations of a line-circuit, and each comprising a series of circuit-controlling key-levers, a revolving current-conducting disk provided with a series of stops, whereby it may be arrested in its rotation by a movement of any key-lever, and an electro-magnetic unison-brake controlling the rotation of said stop-disk, in combination with a line-circuit including the said key-levers, stop-disk, and the actuating electro-magnets of said brake, and switches and circuit-connections for said line-circuit.

9. In a printing-telegraph, two instruments located, respectively, at two stations of a line-circuit, and each comprising a series of circuit-controlling key-levers, a revolving current-conducting disk provided with a series of stops, and a type-wheel rotating in fixed relation to said disk upon a common shaft, said disk being arrested in its rotation by a movement of any key-lever, a synchronal motor for said shaft, and an electro-magnetic brake also controlling the rotation of said shaft, in combination with a line-circuit, including said key-levers, disk, and the actuating electro-magnet of the said brake, and switches and circuit-connections for the said line-circuit.

388,142. ELECTRICAL TYPE-WRITER. James P. McLaughlin, Philadelphia, Pa. Filed Oct. 13, 1887. Serial No. 252,737. (No model.)

Claim.—1. An electrical type-writer comprising an electric main-line circuit, electro-magnets severally included in said main-line circuit, circuit-controlling mechanism for directing current through a particular electro-magnet, stop-levers severally controlled by said electro-magnets, and mechanical key-levers, also for severally controlling said stop-levers.

2. An electrical type-writer comprising an electric main-line circuit, electro-magnets severally included in said main-line circuit, stop-levers controlled severally by said electro-magnets, mechanical key-levers, also for severally controlling said stop-levers, and a local circuit operated by a movement of any stop-lever.

3. An electrical type-writer comprising a series of armature stop-levers, electro-magnets for severally actuating said stop-levers, a main line circuit including said electro-magnets, circuit-controlling mechanism for said main-line circuit, a series of mechanical key-levers, also for severally controlling said stop-levers, and a local circuit controlled by the movement of any stop-lever.

4. An electrical type-writer comprising a series of pivoted armature stop-levers, electro-magnets for severally attracting said stop-levers, a series of mechanical key-levers for severally actuating said stop-levers, and a revolving cylinder provided with stops arrested by the movement of any stop-lever.

5. An electrical type-writer comprising a series of pivoted armature stop-levers, electro-magnets for severally attracting said stop-levers, circuit-controlling mechanism for directing current through a particular magnet, a series of mechanical key-levers severally controlling said stop-levers, and a revolving cylinder provided with stops arrested by the movement of any stop-lever.

6. An electrical type-writer comprising a series of armature stop-levers, electro-magnets for severally actuating said stop-levers and included in a main-line circuit, and a series of mechanical key-levers, also for severally actuating said stop-levers, in combination with a transmitter provided with circuit-controlling keys for directing current through a particular electro-magnet and a local circuit operated by the movement of any stop-lever.

7. An electrical type-writer comprising a series of armature stop-levers, electro-magnets for severally actuating said stop-levers, a mechanical key-board, also for severally actuating said stop-levers, and a revolving stop-cylinder arrested by the actuation of any stop-lever, in combination with a series of circuit-closing keys for directing the current through a particular electro-magnet.

8. An electrical type-writer comprising a series of armature stop-levers, electro-magnets for severally actuating said stop-levers, a series of mechanical key-levers, also for severally actuating said stop-levers, a revolving stop-cylinder arrested by the actuation of any stop-lever, and a local circuit operated also by a movement of any stop-lever.

9. An electrical type-writer comprising a series of circuit-controlling armature stop-levers, electro-magnets for severally attracting said stop-levers, circuit-controlling mechanism and an electric circuit for directing current through a particular electro-magnet, a series of mechanical key-levers for severally actuating said stop-levers, a rotary type-wheel and rotary cylinders in fixed relation to each other, contact-lugs upon said cylinders corresponding to types upon the said type-wheel, and a local circuit including a printing-magnet and controlled by said stop-levers and lugs, as specified.

10. In an electrical type-writer, the combination, with a rotary type-wheel and metallic cylinders rotating with the same provided with metallic contact-lugs corresponding with the types upon said type-wheel, of a circuit-controlling stop-lever for each lug, pivoted to move in the plane of rotation of and to intercept the lug, an electro-magnet controlling each stop-lever, a mechanical key-lever controlling each stop-lever, and a local circuit including a printing electro-magnet and controlled by said stop-levers and lugs.

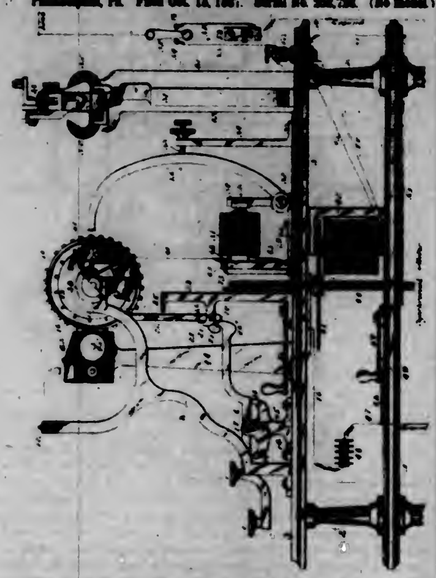
11. In an electrical type-writer, the combination, with a local circuit including electro-magnetic printing mechanism, a series of circuit-controlling stop-levers therefor, and rotary cylinders provided with contact-lugs in operative relation and corresponding to said stop-levers, of a system of levers controlling the action of said stop-levers electro-magnetically and a system of levers for mechanically actuating said stop-levers.

12. In an electrical type-writer, the combination of a rotary type-wheel and cylinders rotating with the same, provided with lugs corresponding with the types upon the type-wheel, with an independent gravity stop-lever for each lug, pivoted to move in the plane of rotation of the lug, but normally out of contact with the same, and an electro-magnet for each stop-lever in operative relation to the latter for moving the same into the path of its corresponding lug, and a mechanical key-lever also controlling each stop-lever, substantially as described.

13. In an electrical type-writer, the combination of a type-wheel and cylinders rotating with the same about a common axis and provided upon their surfaces with lugs corresponding to the types upon the wheel, with an independent stop-lever movable about a pivot to intercept the lug at a definite point, said pivot being located in the line of impact of the lug with the lever, and an electro-magnet for each stop-lever for actuating the same, and a mechanical key-lever also controlling each stop-lever, substantially as described.

14. In an electrical type-writer, the combination of a type-wheel and cylinders rotating with the same about a common axis and provided with stop-lugs corresponding to the types upon the wheel with a stop-lever for each lug, an electro-magnet for each stop-lever for controlling the same electrically, and a key-lever for each stop-lever for controlling the same mechanically, substantially as described.

15. An electrical type-writer comprising a series of armature stop-levers, electro-magnets for severally actuating said stop-levers, a series of mechanical key-levers, also for severally actuating said stop-levers, a revolving stop-cylinder arrested by the actuation of any stop-lever, and a local circuit operated also by a movement of any stop-lever.



16. In a type-writer, the combination of a rotary shaft having a series of segmental recesses with separating-ribs between the same, with the sectorial parts of the type-wheel having their hub portions seated in the segmental recesses and with their edges in contact with each other, and a clamp for securing the sectors together and to the shaft, substantially as described.

17. In an electrical type-writer, the combination of a rotary shaft with segmental recesses and ribs between the same all around the portion of the shaft, with sectorial sections of the type-wheel seated in the recesses with their radial edges in contact with each other, and a sleeve fitting over the shaft and over the hub-sections of the type-wheel for clamping the same, substantially as described.

18. In an electrical type-writer, the combination of the shaft of a rotating type-wheel and the shaft of the transmitter with a rotary shaft geared and imparting motion to both the type-wheel shaft and transmitter-shaft, and a synchronal motor for actuating said rotary shaft.

19. In an electrical type-writer, the combination, with a transmitting-instrument having a circuit-controlling spacing-key, of a receiving-instrument provided with a circuit-controlling spacing stop-lever, a magnet for actuating said stop-lever and controlled by the transmitter spacing-key, a fixed contact for said spacing stop-lever, a local circuit including said stop-lever and fixed contact, and spacing-magnets in said local circuit.

388,143. ELECTRICAL TYPE-WRITER. James P. McLaughlin, Philadelphia, Pa. Filed Oct. 13, 1887. Serial No. 252,738. (No model.)

Claim.—1. In an electrical type-writer, the combination, with a type-wheel and metallic cylinders, all rotating in unison, metallic lugs upon said cylinders corresponding to the types upon the type-wheel, of circuit-controlling stop-levers, one for each lug, a printing and a spacing magnet included in a local circuit with the cylinders and stop-levers, a key-board controlling said stop-levers, a line-circuit, and switches and connections whereby the local circuit may be connected with the line-circuit.

2. The combination, with a circuit-controlling key-board, of stop-cylinders controlled by said key-board, a local circuit also controlled by said key-board, printing and spacing mechanism controlled by said local circuit, a main-line circuit, and switches and connections for connecting and disconnecting said local circuit with the main-line circuit.

3. In an electrical type-writer, the combination of a type-wheel and cylinders of conducting material rotating with the same about a common axis and provided with metallic lugs corresponding to the types upon the wheel, with an independent metallic stop-lever for each lug, normally out of contact with the cylinder, but movable into the path of the lug, an electro-magnet and a printing-lever actuated thereby, a sluggish spacing-magnet for moving the paper after the imprint has been made, and a key-board for actuating the stop-levers to stop the type-wheel and cylinders and to close the circuit of the magnets, substantially as described.

4. In an electrical type-writer, the combination of a type-wheel and metallic cylinders rotating with the same about a common axis and provided upon their surfaces with metallic lugs corresponding to the types upon the wheel, with circuit-controlling stop-levers, one for each lug, a printing and a spacing magnet included in a local circuit with the cylinders and stop-levers, and a mechanical key-board for controlling the stop-levers, substantially as described.

5. In an electrical type-writer, the combination of a type-wheel and cylinders rotating with the same about a common axis and provided with stop-lugs corresponding to the types upon the wheel, with a stop-lever for each lug, having one straight arm movable into the path of the lug and the other arm provided with a hook or nose, and a key-lever for each stop-lever, having a hook or nose at one end engaging the nose on the stop-lever, substantially as described.

6. In an electrical type-writer, a pivotal support for the operating-key levers, consisting of a casting having upon a central stem or branch a series of parallel slots for the reception of the levers, and a series of lugs alternating with the slots for the reception of a pivotal rod common to all the levers, and two lateral branches constituting the common front and back stops, respectively, substantially as described.

7. In an electrical type-writer, the combination of a series of levers in operative relation to the type-keys, with a pivotal support for the stop-levers, consisting of a casting having a longitudinal rib divided into alternate slots and lugs, the latter being connected by a web serving as the front stop of the levers, substantially as described.

8. A pivotal support for a series of independent levers, consisting of a casting having a longitudinal rib divided into alternate lugs and slots, the former being connected by a web serving as the front stop of the levers, and a flange parallel to the rib, serving as a back stop for the levers, substantially as described.

388,144. THILL-COUPLING. Lewis Miller and Maurice L. Wright, Mexico, N. Y. Filed Mar. 24, 1888. Serial No. 268,227. (No model.)

Claim.—1. A thill-coupling composed of a shackle-eye formed in two sections, one of which is rigidly attached to or integral with the thill-iron and the other section hinged to the rigid section, a clamp for holding the hinged eye-section in its closed position, and a safety-guard connected to the thill-iron and adapted to embrace the said hinged eye-section, as set forth.

2. In combination with the axle-clip and shaft-shackle projecting therefrom, the thill-iron 1, formed with the rigid eye-section *a*, the eye-section *a'*, hinged on the rear portion of the rigid eye-section and formed with the forwardly-projecting tongue *b*, and the latch *l*, hinged on the thill-iron and formed with the rearwardly-projecting guard *l*, extending between the rear of the eye-sections *a a'* and axle-clip and below the said clip, substantially as described and shown.

3. In combination with the thill-iron 1, formed with the eye-section *a*, the eye-section *a'*, hinged on the section *a*, and having the forwardly-projecting tongue *b* provided with the recess *r*, and the latch *l*, hinged to the thill-iron, the ball *c*, connected to the said latch and adapted to enter into the recess *r*, and the rubber cushion *e*, seated in said recess, substantially as described and shown.

4. In combination with the thill-iron 1, formed with the rigid eye-section *a*, and the eye-section *a'*, hinged on the rear portion of the rigid eye-section and formed with the forwardly-projecting tongue *b*, the latch *l*, hinged to the thill-iron and formed with the thumb-piece *f* and with the rearwardly-extending guard *l*, embracing the rear portions of the eye-sections *a a'*, and the ball *c*, connected to the latch and embracing the tongue *b*, substantially as described and shown.

388,145. METALLIC ALLOY. Hermann Cottenham and Charles Lagoux, Geneva, Switzerland, assignors to the Usine Genevoise de Dégrossissage d'Or, same place. Filed Apr. 19, 1888. Serial No. 271,212. (No specimens.)

Claim.—1. An alloy composed of gold, palladium, rhodium, copper, nickel, manganese, silver, and platine, for the purpose specified.

2. An alloy composed of thirty to forty-five parts of gold, twenty to thirty parts of palladium, one-tenth of a part to five parts of rhodium, ten to twenty parts of copper, one to ten parts of nickel, one-tenth of a part to five parts of manganese, one-tenth of a part to five parts of silver, and one-tenth of a part to two and a half parts of platine, substantially as described, and for the purpose specified.

388,146. METALLIC ALLOY. Hermann Cottenham and Charles Lagoux, Geneva, Switzerland, assignors to the Usine Genevoise de Dégrossissage d'Or, same place. Filed Apr. 19, 1888. Serial No. 271,213. (No specimens.)

Claim.—1. An alloy composed of gold, palladium, rhodium, copper, manganese, silver, and platine, for the purpose specified.

2. An alloy composed of thirty to forty parts of gold, thirty to forty parts of palladium, one-tenth of a part to five parts of rhodium, ten to twenty parts of copper, one-tenth of a part to five parts of manganese, one-tenth of a part to five parts silver, and one-tenth of a part to five parts of platine, substantially as described, and for the purpose specified.

388,147. METALLIC ALLOY. HERMANN GUTZKOW and CHARLES LAGRIVE, Geneva, Switzerland, assignors to the Usine Genevoise de Dégrossissage d'Or, same place. Filed Apr. 28, 1888. Serial No. 271,941. (No specimens.)

Claim.—1. A metallic alloy composed of gold, palladium, copper, silver, cobalt, wolfram, rhodium, and platine, for the purpose specified.

2. A metallic alloy composed of thirty to forty parts of gold, thirty to forty parts of palladium, ten to twenty parts of copper, one-tenth of a part to five parts of silver, one-tenth of a part to two and a half parts of cobalt, one-tenth of a part to five parts of wolfram, one-tenth of a part to five parts of rhodium, and one-tenth of a part to five parts of platine, for the purpose specified.

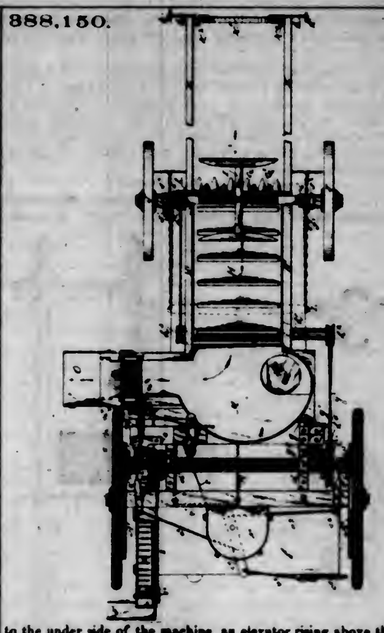
388,148. ADJUSTABLE CHAMFER-GAGE FOR DRAWING-KNIVES. HARRY H. PERKINS, Kewanee, Ill. Filed Apr. 3, 1888. Serial No. 269,418. (No model.)

Claim.—1. The combination of the connected laterally-adjustable shoes, the clamping-arms E, pivoted thereon, and the set-screws to operate said clamping-arms, substantially as described.

2. The combination of the shoes having the ears C, the clamping-arms passing between said ears, the rod F, passing through aligned openings in the ear C and in the clamping-arms, and thereby serving to connect the shoes together and forming pivots for the clamping-arms, and the set-screws in the rear ends of the clamping-arms, to operate the same, substantially as described.

3. The combination of the shoes B, having the ears C and the rearward-extending portions D beyond said ears, the clamping-arms E, passing between said ears, the rod F, extending through aligned openings in the ears and in the clamping-arms, and the set-screws G, engaging threaded openings in the rear ends of the clamping-arms and adapted to bear upon the rearward-extending portions D of the shoes, for the purpose set forth, substantially as described.

388,149. BOOK-MARK AND CLASP. SAMUEL POWELL, Chicago, Ill., assignor to Cameron, Amberg & Co., same place. Filed Sept. 12, 1887. Serial No. 249,410. (No model.)

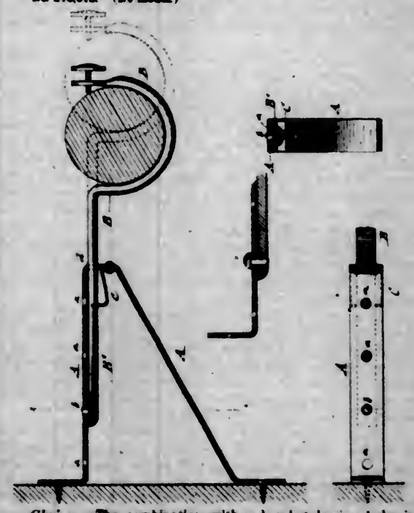


Claim.—1. A book-mark and clasp, comprising, in combination, a clasp having clamping-jaws adapted to embrace the free edges of the book-covers, and to be pivotally secured to one of said covers, and a finger or marker pivotally connected to said clasp, substantially as described.

2. A book-mark and clasp, comprising, in combination, a clasp having clamping-jaws, whereby to embrace the free edges of the cover when the book is closed, and means for pivotally connecting the same to the book, and a marking-finger connected to said clasp and having a lateral movement on its support, substantially as set forth.

3. A combined book-mark and clasp, comprising a clasp having clamping-jaws adapted to embrace the free edges of the book-covers when the book is closed, and a pivotal connection whereby to secure the clasp to the book-cover, and a marking-finger pivoted to the clasp at a point intermediate its clamping-jaws, substantially as described.

388,150. CORN-HARVESTER. HORACE R. REEVES, Sanborn, Iowa. Filed May 22, 1888. Serial No. 273,970. (No model.)

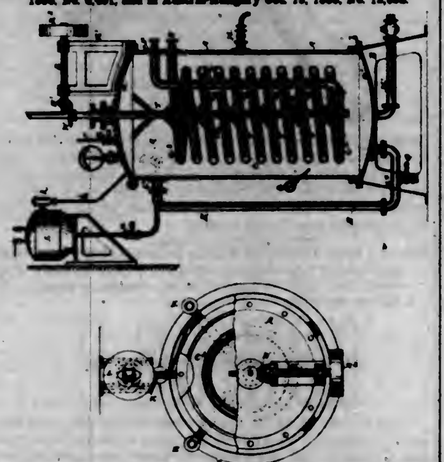


Claim.—1. The combination, with the cutting mechanism at the front of the machine and an elevator in close contact therewith, of a horizontal platform provided with a raised rim and having an aperture, as described, a step secured to the frame-work beneath said aperture, husking mechanism at the side of the platform and machine, a falling apron in front of the husking mechanism, and a cord secured to the apron, all as described, and for the purpose set forth.

2. The combination, with the husking mechanism and a downwardly-inclined chute arranged in the rear thereof, of a box secured to the under side of the machine, an elevator rising above the top of the machine at the rear, and a swiveled trough for communication at will with either the box or the elevator, substantially as described.

3. The combination, with the husking mechanism and a downwardly-inclined chute arranged in rear thereof, of a box provided with a falling end-gate secured to the under side of the machine, an operating-cord secured to the end-gate, an elevator rising above the top of the machine at the rear, a lateral downwardly-inclined trough attached to the upper end of the elevator, and a swiveled trough beneath the husking mechanism for communication at will with either the box or the elevator, substantially as described, and for the purpose set forth.

388,151. CURTAIN-POLE BRACKET. HENRY REUSS, New York, and THEODORE LEBEGERN, Brooklyn, N. Y. Filed June 23, 1888. Serial No. 278,012. (No model.)

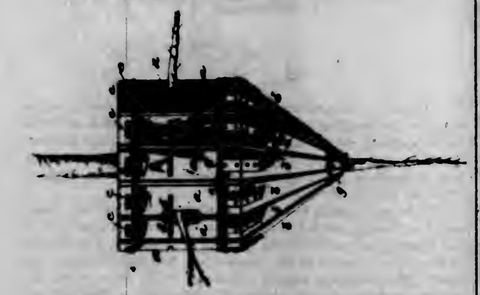


Claim.—The combination, with a bracket having holes in its horizontal portion, of a pole-supporting arm guided in said bracket, a pin for connecting the supporting-arm to one of said holes, and a spring attached to the bracket and retaining the supporting-arm firmly in position, substantially as set forth.

388,152. NON-MAGNETIC ALLOY. ALFRED H. RAMSAY, Porte Martel, Switzerland, assignor to C. Hegmann-Thiébaud & Fils, same place. Filed May 26, 1888. Serial No. 275,169. (No specimens.)

Claim.—1. A metallic alloy composed of tin, copper, lead, zinc, iron, nickel, and manganese, for the purpose specified.

2. The alloyage of 0.62 part of tin with 58.10 parts of copper, 0.09 part of lead, 18.90 parts of zinc, 1.28 parts of iron, 20.62 parts of nickel, and 0.26 part of manganese, for the purpose specified.

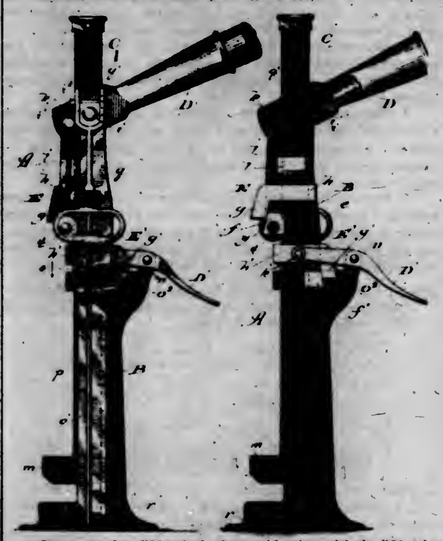


388,153. PASTEURIZING BEER, WINE, &c. HERMANN SCHAARWÄCHTER, Barmen-Rittershausen, Prussia, Germany. Filed Dec. 8, 1886. Serial No. 221,694. (No model.) Patented in Germany Oct. 26, 1885, No. 36,041; in France Apr. 10, 1886, No. 182,600; in England May 12, 1886, No. 6,691, and in Austria-Hungary Oct. 19, 1886, No. 19,532.

Claim.—1. In an apparatus for pasteurizing beer, wine, &c., the combination consisting of the cylinder A, supported on bracket B, and containing the pipe c', with coils c^2 c^2, the pipe E, having one end thereof connected with the bottom of said cylinder A, the other end connected near the top thereof, the rotary cleansing-tube T, extending axially through the coil c^2 c^2, the perforated arms u, connected with said rotary pipe T, and the gearing W W', and shaft X, adapted to operate the said tube T, substantially as shown and described.

2. The combination, in an apparatus for pasteurizing beer, wine, &c., of the regulating-vessel L, connected to cylinder A by pipe N, with cock M, and safety-valve K', connected with cylinder A, substantially as shown and described.

388,154. DEVICE FOR TRANSPLANTING TREES. THOMAS E. STANLEY and CALVIN D. GULLEY, Fort Worth, Tex. Filed May 29, 1888. Serial No. 275,462. (No model.)



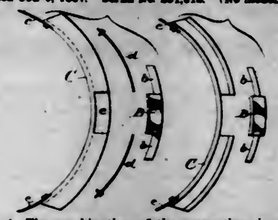
Claim.—In a device for transplanting trees, the combination, with a suitable head having pins or spikes around its edge, of a series of staves having transverse slots, with which the pins engage, and recessed on their edges to form openings for the roots to pass, and means for holding the staves together, substantially as and for the purpose set forth.

388,155. ART OF MANUFACTURING RINGS FOR LOOM-TEMPLES. EDWARD S. STEBBINS, Hopedale, Mass., assignor to the Dutcher Temple Company, same place. Filed Mar. 30, 1887. Serial No. 232,946. (No model.)

Claim.—The herein-described improvement in the art or method of manufacturing temple-rings, which consists, first, in providing the periphery of the said ring with one or more annular grooves or depressions for the reception of the point of the drill, and, second, boring the holes for the reception of pins with the point of the drill in said groove or depression, whereby the said drill is prevented from glancing off or being displaced, substantially as described.

388,156. LIFTING-JACK. AXEL A. STRÖM, Austin, Ill. Filed Mar. 19, 1888. Serial No. 267,694. (No model.)

Claim.—1. In a lifting-jack, the combination, with the lifting-bar and standard, of an operating-lever fulcrumed on the standard, with its short arm extending beyond one side of the lifting-bar, and a friction-clutch comprising a collar on the bar, having a lip projecting from it at the side where the short arm of the lever extends, and a wedge on one side of the lifting-bar in line with the space between the said bar and lip and linked to the short arm of the lever, substantially as described.



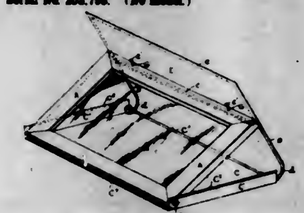
2. In a lifting-jack, the combination, with the lifting-bar and standard, of a lever, D, fulcrumed on the standard, with its short arm extending beyond one side of the lifting-bar, and a friction-clutch, E, comprising a collar, A, on the bar, having a beveled lip, *g*, projecting from it at the side where the short arm of the lever extends, and a block, *f*, on one side of the lifting-bar in line with the space between the said bar and lip, and linked to the short arm of the lever, substantially as described.

3. In a lifting-jack, the combination, with the lifting-bar, standard, and a lifting-clutch, of a retaining-clutch comprising a collar on the bar having a lip projecting from it on one side, and a wedge-block entirely on one side of the lifting-bar in line with and below the space between the said lip and bar, and confined in its operative position against material vertical play, substantially as described.

4. In a lifting-jack, the combination of a lifting-bar, C, a standard, B, having a chamber, c^2, reduced laterally toward one end, a lifting-clutch, and a retaining-clutch, E', comprising a collar, A', having a lip, *g'*, on one side, a lever, D', engaging with the collar, and a block, *f'*, confined in the chamber c^2 on one side of the bar below the said lip, substantially as described.

5. In a lifting-jack, A, the combination of a standard, B, having the expanded portion *c*, bounded by sides *q*, having recesses *q'* in their upper ends, a lifting-bar, C, a guide-bearing, *l*, for the bar, a friction-clutch, E, comprising a collar, A, on the bar, having a lip, *g*, on one side and a block, *f*, below the said lip against the bar, and a lever, D, fulcrumed in the recesses *q'* and linked to the block *f*, substantially as described.

388,157. WATCH-CASE SPRING. CHARLES TIBER, Hartford, Conn. Filed Oct. 6, 1887. Serial No. 251,612. (No model.)



Claim.—1. The combination of the supporting-rim C, recessed substantially as described, the catch having arms *b b* resting in the recess of said rim, and the spring or springs for pressing against the catch, substantially as described, and for the purpose specified.

2. The combination of a watch-case, the supporting-rim, the spring-pressed catch mounted therein, and the dust-band secured to the respective ends of said rim, substantially as described, and for the purpose specified.

3. The combination of the supporting-rim stationarily affixed in a watch-case, the catch moving inwardly and outwardly and supported in said movement by said rim, and the spring or springs for pressing against said catch, substantially as described, and for the purpose specified.

4. The combination of the supporting-rim having lateral flanges forming a groove or recess at the outer edge of said rim, the catch having its body working in a notch in the upper flange of said rim, and the arms *b b*, working within the groove on each side of said notch, substantially as described, and for the purpose specified.

388,158. DRAWING AND TRACING APPARATUS. WILLIAM P. THOMPSON, Liverpool, County of Lancaster, England. Filed Oct. 20, 1887. Serial No. 252,766. (No model.)

Claim.—1. The combination of the tray C, formed of tinned iron having side pieces, C' C', turned up and perforated with holes C³ C³, and the frame A, carrying fixed thereon the pivots *a a*, having their shanks resting freely in holes C³ C³, substantially as and for the purpose described.

2. The combination of the tray C, formed of sheet metal with bright reflecting upper surface, with tracing glass and frame A B, placed at a suitable angle thereto, substantially as described, whereby the almost perfect reflection of a mirror is obtained without the fear of fracture or the use of heavy and expensive framing required with ordinary mirror-glass reflectors.

3. The combination, with the reflector C, of the frame A, folding flat over same, and the shade E, and supporting-legs D, bent at *d*, so as to fold flat over frame A.

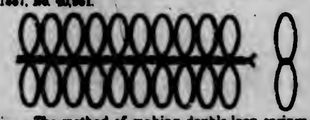
4. The combination of the shade E with the legs D, rigid therewith, whereby one adjustment only is required for both the legs and shield, instead of separate adjustments, as formerly.

5. The combination of reflector C, transparent drawing-frame A B, hinged thereto, legs D, hinged to said frame, and shield E, rigidly fixed to legs D and arranged to fold over the glass A.

6. The combination of the plate C, having sides C' turned up at right angles and to the height of the folded apparatus, (glass frame A B and shield E,) whereby the plate C acts as a box to inclose the other parts, substantially as described.

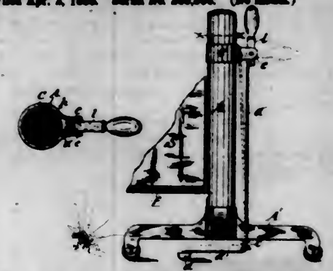
7. The combination of a sheet-metal base, C, having back wire, C², and legs D, having their lower ends turned round wire C² and their upper ends connected by plate E, carrying button-holes *e'*, with the frame A, also hinged to base C and carrying the buttons G, attached thereto.

388,159. HOSE-NOZZLE. EDWIN R. TOMLINSON, Bridgeport, Conn. Filed Mar. 9, 1888. Serial No. 266,603. (No model.)



Claim.—The combination, with the hose-nozzle having cheek-piece formed therewith, of the frame pivoted to said cheek-piece and having stops adapted to abut, respectively, on opposite sides of said

388,159.

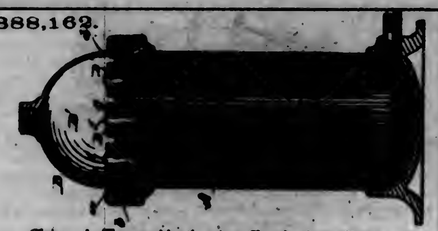


cheek-piece, the cone secured to an arm projecting from said frame and adapted to be carried by the swing of the latter into inverted position immediately beyond the nozzle, the shaft extending from the frame, and the rubber roller mounted on said shaft and adapted to be swung across and against the end of the nozzle, substantially as and for the purposes hereinbefore set forth.

388,160. PROCESS OF MAKING DOUBLE-LOOP SPRINGS. HERMANN TOELKE, Hohen-Limburg, Westphalia, Prussia, Germany. Filed Nov. 3, 1887. Serial No. 254,307. (Model.) Patented in Germany Feb. 25, 1887, No. 40,661.

Claim.—The method of making double-loop springs, which consists in winding two wires side by side round a smooth bar, shifting them off from the bar, and drawing the product, now appearing as a double screw or spiral spring, asunder, forming, apparently, two interlaced spiral springs, and passing it between two rollers or pressing it flat under some other convenient pressing apparatus.

388,161. FOLDING SCREEN. HENRY C. TRIPP, Auburn, N. Y. Filed Apr. 2, 1888. Serial No. 269,309. (No model.)

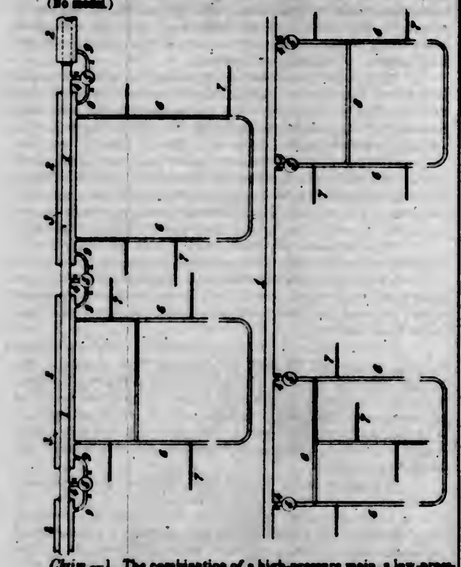


Claim.—1. In combination with the folding screen S and movable standard A, supporting one end of said screen, the slide-rod *a*, connected to the standard and having its lower end adapted to engage the floor, the spring *c*, pressing the rod downward, and the lever *l*, fulcrumed on the standard and connected with the upper end of the slide-rod, substantially as described and shown.

2. In combination with the folding screen S and movable standard A, supporting one end of said screen, the slide-rod *a*, connected to the standard and provided with the offset *a'*, terminating with the foot *d*, the collar C, secured to the standard and formed with ears *c c*, the lever *l*, pivoted on said ears and connected to the slide-rod, and the spring *c*, pressing the rod downward, substantially as described and shown.

388,162. FILTER. FRANK E. WAY, Springfield, Ohio, assignor, by direct and mesne assignments, to the Pasteur Chamberland Filter Company, same place. Filed Nov. 21, 1887. Serial No. 255,994. (No model.)

388,162.

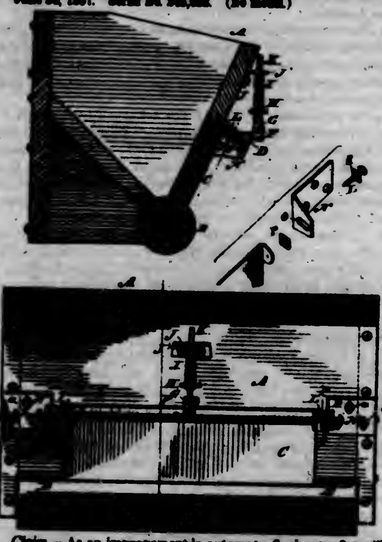


Claim.—1. The combination, in a filter having a filtering-chamber, a cap or partition having an opening therein, and a filtering-tube, one end of which is adapted to project through said opening, of a flexible coupler adapted to fit into the cast or pocket about said opening, provided with laterally-projecting flanges, as described, said coupler being adapted to receive the end or nozzle of said filtering-tube and hold the same in position in the opening in said cap or partition, and at the same time permit the said tube to be readily removed or replaced, substantially as described.

2. The combination, in a filter, with a cap having a series of pockets therein, a flexible coupler in each of said pockets, provided with laterally-projecting flanges, as described, and a central opening adapted to register with an opening in the bottom of said pocket, of filtering-tubes having projecting nozzles adapted to be projected through said openings and held in position by said flexible couplers in such a manner that they may be readily removed therefrom, substantially as described.

3. The combination, with the cap having one or more pockets therein, each pocket having a projecting flange in the mouth thereof, of a flexible coupler adapted to fit into said pocket and provided with a central opening and the laterally-projecting flanges, as described, and a tube or pipe adapted to be inserted into said opening, substantially as specified.

4. The combination, in a filter having a filtering-tube with a nozzle thereon and a cap or partition through which said tube is adapted to discharge, of a flexible coupler having the main body adapted to rest in contact with said partition and a central opening therein, and an annular flange about the central opening, said opening being adapted to register with the opening in said partition and to receive the nozzle of said filtering-tube and retain the same by the elasticity of said coupler or permit it to be removed when desired, and a flange or projection to prevent the coupler from being withdrawn from its position when the tube is removed or inserted, substantially as specified.



388,163. SYSTEM OF GAS-DISTRIBUTION. GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa. Filed Aug. 15, 1884. Serial No. 140,687. (No model.)

Claim.—1. The combination of a high-pressure main, a low-pressure main communicating therewith at two or more points, two or more pressure-regulators, each governing an avenue of communication between the high and the low pressure main, and a low-pressure distributing-main connected at both of its ends or at two or more points to the low-pressure main and provided with a series of service-pipes, substantially as set forth.

2. The combination of a high-pressure main and a low-pressure distribution system composed of two or more interconnected lines of mains, said system communicating with the high-pressure main by two or more independent connections, each governed by a separate pressure-regulator, substantially as set forth.

388,164. AUTOMATIC FEED-GATE. ROSS H. WHITNEY, Avenue City, Mo., assignor of one-fourth to Lawrence Wilson, same place. Filed June 23, 1887. Serial No. 242,022. (No model.)

Claim.—As an improvement in automatic feed-gates for mills, the combination, with the yielding feed-gate, of the horizontally-adjustable pivot-screws L L, slotted supporters N N for said screws, the nuts P R on said screws and clamping the same to the supporters, and the screws *a a* for vertical adjustment of the supporters N N and gate, substantially as set forth.

388,165. PLOW. ANDREW WIRD and HERMAN LÜDERS, Sweet Home, Tex. Filed June 9, 1888. Serial No. 276,660. (No model.)

Claim.—1. The combination, with the plow-beam, the slotted and braced standard, and the adjustable land-bar, of the winged attachment J, formed with perforated lugs, the plow-point formed with upper and lower extensions and secured to said attachment, and the transverse bolts which secure the said attachment and point to the standard, substantially as described.

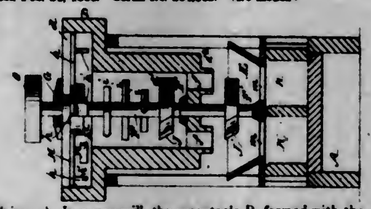
2. The combination, with the plow-beam, the slotted and braced standard, and the adjustable land-bar, of the winged attachment J and plow-point secured to the said standard, substantially as described.

388,166. GUN-SIGHT. GEORGE W. WOOD, Granville, N. Y., and JAMES W. CARVER, Peulet, Vt.; said Carver assignor to said Wood. Filed Oct. 3, 1887. Serial No. 251,205. (No model.)

Claim.—1. In a gun-sight, the combination, with a main frame and a frame sliding in and vertically adjustable on said main frame, of a supplemental and laterally-sliding frame on the supplemental frame, and a vertically-adjustable sight-plate carried by the supplemental and laterally-sliding frame, substantially as herein shown and described.

388,166.

2. The combination, with the frame E, of a frame, C, sliding vertically thereon, a supplemental frame, F, sliding laterally on said frame C, and a block, G, sliding vertically in said frame F, and a plate with sight-hole secured to said block G, substantially as described, for the purpose specified.



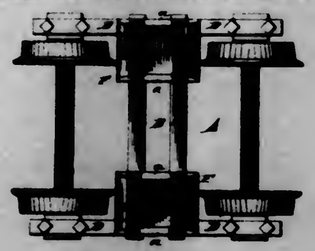
3. The combination, with the frame E, of a frame, C, sliding vertically thereon, a frame, F, sliding laterally on said frame C, and a block, G, sliding vertically on said frame F, and a plate secured to said block, a sight-hole passing through said plate and block, substantially as and for the purpose described.

4. The combination, with the frame E, having screw-spindle *h*, of a frame, C, provided with a lug, *a*, engaging said screw-spindle *h* and having a horizontal screw-spindle, *f*, a frame, F, engaging said screw-spindle *f* and having a vertical screw-spindle, *h*, and a block, G, engaging said screw-spindle and having attached thereto the sight-plate with sight-hole *k*, the said frames and block C, F, and G, adapted to slide, all substantially as and for the purposes described.

5. The combination, with the frame E, having a graduated scale on its sides, of a frame, C, sliding vertically in said frame E and provided with a graduated scale on its lower part, a frame, F, sliding laterally on said frame C and provided with a graduated scale on its lower part, a vertically-sliding block on the laterally-sliding frame F, and a plate having a sight-hole secured to said block, substantially as herein shown and described.

6. A gun-sight consisting of the frame E, the closed sight A, vertically and laterally adjustable on the said frame, as herein described, and the open sight B, below the closed sight, and vertically and laterally adjustable on the frame E, substantially as herein shown and described.

388,167. PUG-MILL. Henry Woodcock, Perth Amboy, N. J. Filed Feb. 21, 1888. Serial No. 264,903. (No model.)

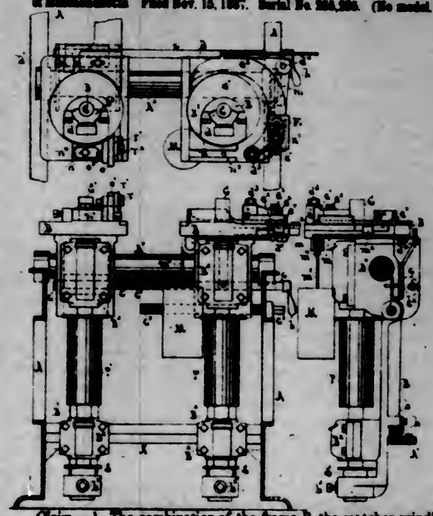


Claim.—1. In a pug-mill, the receptacle D, formed with the pan *d* and mill *d'*, below the same and of less diameter than the pan, in combination with the shaft F, arms *h*, and blades *h'*, to work in the pan, the arms *i i*, to work in the mill, and the propeller J, attached to the shaft below the arms *i i* for forcing the clay out of the mill, substantially as described.

2. The receptacle D, formed with pan *d* and mill *d'*, and the hopper E and receptacle K K, in combination with the shaft F, provided with arms *h h' i*, and propeller J in the receptacle D, and the propeller J', arranged to work in the hopper E, substantially as described.

388,168. SAFETY-SHOE FOR CAR-TRUCKS. Abram M. Woodruff, Superior, Nebr. Filed Jan. 25, 1888. Serial No. 261,886. (No model.)

Claim.—The combination, with the central transverse timbers, B, and the longitudinal brace D of a truck, of the head-blocks E, secured



388,168.

to said timbers and brace, and the shoe F, bolted to the said head-block, timbers, and brace, the said shoe being provided with downwardly-extending longitudinal flanges *a*, and having a central horizontal and flat bearing-surface and inclined and flaring end surfaces, *b b'*, between the said flanges, substantially as herein shown and described.

388,169. PLANING-MACHINE. Solomon A. Woods and John R. Thomas, Boston, Mass., assignors to The S. A. Woods Machine Company, of Massachusetts. Filed Nov. 15, 1887. Serial No. 255,359. (No model.)

Claim.—1. The combination of the frame B, the matcher-spindle C, carried thereby and supported and sliding transversely upon the girt A^3, and having the hole or bearing a^3, which encompasses the girt, made compressible by being slotted through one side, and the cam c^3, mounted in and moving with said frame B and arranged to compress said bearing around said girt and secure said frame thereto in the desired position, substantially as described.

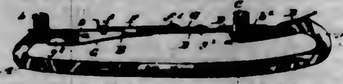
2. The combination of the frame B, the matcher-spindle C, carried thereby and supporting and sliding transversely upon the girt A^3, and having the hole or bearing a^3, which encompasses the girt, made compressible by being slotted through one side, the revolubie shaft *c*, mounted in a fixed position in the main frame A and provided with a spline-groove lengthwise thereof, and the cam c^3, mounted in and moving with said frame B around and along said revolubie shaft and provided with a spline to fit the groove in the latter, and arranged to compress said bearing around said girt and secure said frame thereto in the desired position by turning shaft *c*, substantially as described.

3. The combination of the cutter-head spindle C, the chip-breaker E, partly surrounding the same and swinging upon its pivot d^3, the lever *m*, swinging upon its fulcrum d^5 and taking a bearing behind and against said chip-breaker, and the cord m^2 and weight M, connected to said lever and arranged to press it against said chip-breaker, substantially as described.

4. The combination of the cutter-head spindle C, the chip-breaker E, partly surrounding the same and swinging upon its pivot d^3, the lever *m*, swinging upon its fulcrum-pivot d^5 and projecting therefrom along the chip-breaker toward pivot d^3, and taking a bearing behind and against said chip-breaker between pivots d^3 and d^5, and pressure-producing mechanism connected to the outer end of said lever and arranged to give it a yielding pressure against said chip-breaker, substantially as described.

5. The combination of the cutter-head spindle C, the chip-breaker E, partly surrounding the same and swinging upon its pivot d^3, the lever *m*, swinging upon its fulcrum-pivot d^5 and projecting therefrom along the chip-breaker toward pivot d^3, and taking a bearing behind and against said chip-breaker between pivots d^3 and d^5, and the cord m^2 and weight M, connected to said lever and arranged to press it against the chip-breaker, substantially as described

6. The combination of the cutter-head spindle C and the chip-breaker E, partly surrounding the same, swinging upon its pivot d^3 in a plane transverse to the axis of the spindle C, and formed of two members or parts united together by a telescoping or sliding joint opening and closing longitudinally of the chip-breaker and located upon the same side of the spindle C as pivot d^3, opposite the path of the work, whereby the extension of the members upon each other enlarges the diameter of the space within the curve of the interior of the chip-breaker, substantially as described.



7. The combination of the cutter-head spindle C, the chip-breaker E, partly surrounding the same, swinging upon its pivot d^3, and formed of two members, e' e^2, made longitudinally extensible one upon the other, the lever *m*, swinging upon its fulcrum-pivot d^5 and taking a bearing behind and against said chip-breaker, and pressure-producing mechanism connected to said lever and arranged to press it against said chip-breaker, substantially as described.

8. The combination of the cutter-head spindle C, the horizontal table D', provided with the transverse groove *n*, the block *n'*, having the tongue n^2 sliding therein transversely to the path of the lumber and adjustably secured thereto, and provided with the horizontal groove across its face, and the plate d', provided with the tongue *o*, sliding in said horizontal groove, adjustably secured to said block, and having a vertical edge presented to the path of the cutter, forming therewith a throat or mouth-piece against the lumber, substantially as described.

9. The combination of the cutter-head spindle C, the horizontal table D', provided with the transverse groove *n*, the block *n'*, having the tongue n^2 sliding therein transversely to the path of the lumber and adjustably secured therein, and the block *r'*, provided with tongue *r*, fitting and sliding vertically in a groove connected to the outer face of block *n*, and arranged with a pressor foot or shoe at its lower end adapted to bear upon the top of the lumber while the cutter-head is acting upon its edge, substantially as described.

10. The combination of the cutter-head spindle C, formed with a flat lower end, the step S, provided with the upper chamber, s', which receives the spindle, and the lower central chamber, s^2, of smaller diameter than and beneath the spindle, and the plate s^3, provided with the central hole, s^4, and one or more grooves, s^5, in one surface and edge and arranged in said step with said grooves downward to form the rest for the end of the spindle, and the cover for oil-chamber s^3, substantially as described.

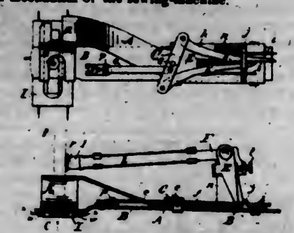
388,170. SKATE. John H. Young, Concord, N. H. Filed May 26, 1888. Serial No. 275,287. (No model.)

Claim.—1. The combination of a sole-plate having a transverse depression for the reception of the adjustable sole-clamps, the said adjustable sole-clamps provided each with an upward-projecting leg at or near their inner ends, an adjusting-plate adapted for longitudinal movement and having oppositely-inclined slots for the reception of the legs of said adjustable sole-clamps, their inner ends being nearer together than their forward ends, and suitable operating mechanism for the said adjusting-plate, substantially as described.

2. In adjusting mechanism for skates, the combination of the adjustable sole and heel clamps, an adjusting-plate for operating the former provided with a serrated slot, and an actuating-lever to which is pivotally connected one end of the adjustable heel-clamp, and having at one end a cam-pivot for operating within the said serrated slot, all substantially as and for the purpose set forth.

3. In adjusting mechanism for skates, the combination, with the adjustable sole and heel clamps, of an adjusting-plate and actuating-lever for operating the same, and means whereby the said clamps may adapt themselves to various widths of boots, comprising a cam-pivot secured to one end of the said actuating-lever and a serrated slot formed in said adjusting-plate in which said cam operates, substantially for the purpose specified.

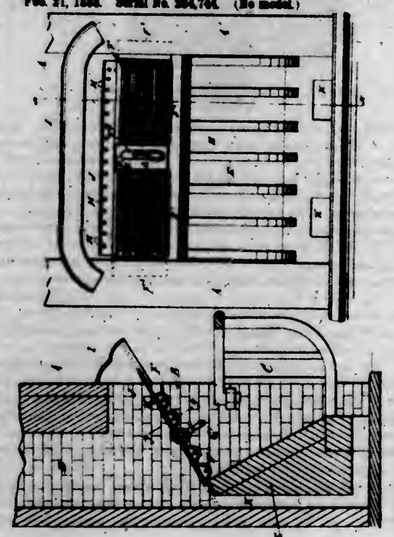
388,171. ICE-CREEPER FOR RUBBERS. Charles S. Ashton, Philadelphia, Pa. Filed Mar. 6, 1888. Serial No. 266,304. (No model.)



Claim.—1. The improved ice-creeper for horses, consisting of the plate D, having a recess to receive a toe-calk and provided on its inner edge with a hook, G, for engaging a horseshoe, and on its front edge with the eyed legs K K' and the loop L', connecting with said legs, and a strap, M, as shown and described.

2. In an ice-creeper for horses, the combination, with a base-plate adapted to the horse's shoe, of a hook adapted to engage the shoe and having a shank adjustable on the base-plate, and a set-screw for locking the hook in its adjustment, having a square-pointed head adapted to serve also as an ice-spur, substantially as described.

388,172. BUTTON-HOLE ATTACHMENT FOR SEWING-MACHINES. William H. Armbruster, Charleston, Ill., assignor, by direct and mesne assignments, to Edwin J. Teal, New Haven, Conn. Filed June 13, 1887. Serial No. 241,167. (No model.)



Brief.—The attachment is supported by the presser-bar. The device for holding the fabric consists of the plate I, having two fixed pins at one end and two at the other end which may be retracted or extended. (See Fig. 4.) The longitudinal feed is produced by the ordinary feed mechanism of the sewing-machine.

Claim.—1. In a sewing-machine attachment for working button-holes, the combination, with the presser-foot bar, the stitch-forming and the feeding mechanism of a sewing-machine, of the body A, having means for securing it to the presser-foot bar, carrier B, arranged to slide longitudinally thereon and having the downwardly-projecting tapering annular flange *d*, the slotted cloth-clamp mounted on said flange, bar C, arms *f* and A, each having a hooked shoulder, *k*, and a spring, *i*, guide-bar *j*, lever E, and lever F, having adjusting-screw *t*, all arranged to co-operate in the manner and for the purpose specified.

2. In a sewing-machine attachment for working button-holes, the combination, with the presser-foot bar, the stitch-forming and the feeding mechanism of a sewing-machine, the body A, secured to the presser-foot bar, and the reciprocating cloth-clamp carrier B, having hole *b* and tapering annular flange *d*, of the plate I, having slot *u*, adapted to engage said flange *d*, fixed pins *y w*, and sliding pins *x x'*, arranged to be retracted within the plate, all substantially as and for the purpose specified.

388,173. FIRE-PLACE. Robert R. Bubber, Lexington, Mo. Filed Feb. 21, 1888. Serial No. 264,764. (No model.)

Claim.—1. In a fire-place, the combination, with a grate having a rearwardly-inclined back, of a corrugated top plate held above the grate, a fixed hood held in front of and above the said corrugated top plate, and a flat plate held to slide on top of the said corrugated plate, so as to increase or diminish the opening between said corrugated top plate and the said hood, substantially as shown and described.

2. In a fire-place, the combination, with a grate having a rearwardly-extending back and opening into the chimney, of a corrugated top plate held above the said grate and resting on the top of the back, a fixed hood held in front of and above the said corrugated plate, a plate provided with openings and held to slide on top of the said corrugated plate, and a handle secured on the said plate and projecting through a slot in the said corrugated plate, substantially as shown and described.

3. In a fire-place, a grate having an inclined back and provided with air-inlet channels extending behind the grate and up into the chimney, in combination with a corrugated plate held above the said grate and provided with flanges resting in the side walls, the lower end of the said corrugated plate resting on the top of the said back, a hood held in front of and above the said corrugated plate, a plate held to slide on the top of the said corrugated plate, and a handle secured to the said plate and projecting through a slot in the said corrugated plate, said sliding plate being adapted to open or close the opening between the said hood and the corrugated plate, and also to open and close the inner openings of the said channels, substantially as shown and described.

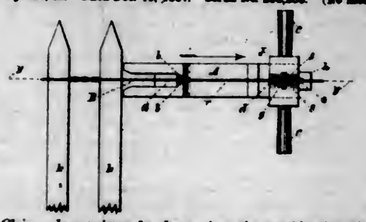
388,174. CIGAR-ROLLING MACHINE. CLARK W. BOBAR, New York, N. Y. Filed Mar. 30, 1888. Serial No. 268,969. (No model.)

Claim.—1. In cigar-rolling machines, a cigar-receiving mold formed of a set of spring-closed individually-yielding power-driven rolls with an opening at one end for the endwise insertion and withdrawal of the cigar, in combination with a spreader individually connected to each roll, whereby all of said rolls are simultaneously spread apart at that end of the mold through which the cigar is inserted and withdrawn, substantially as and for the purposes hereinbefore set forth.

2. The combination, with spring-closed, yielding, power-driven rolls, inclosing a cigar-mold space, access to which is had from one end of the rolls, and mechanism for spreading said rolls apart so as to open the mold at that end, of a support movable to and from said end to permit the cigar to be inserted in and withdrawn from the mold, and a tip-forming thimble carried by said support, substantially as hereinbefore set forth.

3. The spring-closed power-driven cigar-mold rolls, supported at one end only and inclosing at their other end an opening through which the cigar is inserted and withdrawn from between them, and mechanism for spreading the rolls apart, in combination with a support movable to and from the said entrance end of the rolls, and a tip-forming thimble carried by said support, substantially as and for the purposes hereinbefore set forth.

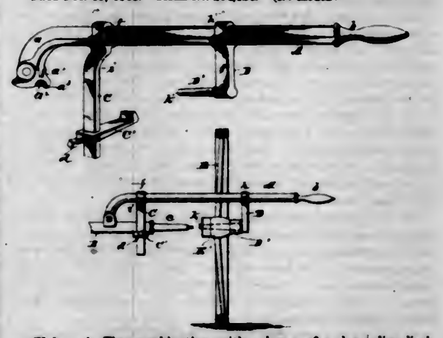
4. The combination of the rolls D, the slotted standards B C, in which said rolls are supported at one end only, the spreader F, the driving-shaft, and the gearing for communicating motion from said shaft to said rolls, substantially as and for the purposes hereinbefore set forth.



5. The combination, with the spring-closed power-driven rolls inclosing a cigar-mold space, access to which is had from one end of the rolls, and mechanism for spreading the rolls apart, of a support movable to and from this end of the rolls, and a tip-forming thimble and a cutter for shaping the point end of the wrapper, both of which are carried by said support, substantially as and for the purposes hereinbefore set forth.

6. The combination, with the spring-closed power-driven cigar-mold rolls, inclosing at one end an opening through which the cigar is inserted endwise between them, and mechanism for spreading the rolls apart, of the thimble head-stock located at this end of the rolls and movable therefrom so as to leave said opening unobstructed, and the thimble carried by and adjustable upon said head-stock, substantially as and for the purposes hereinbefore set forth.

7. The combination of the rolls A, inclosing a mold-space into which a cigar is inserted endwise from one end of the rolls, the support and tip-forming thimble carried thereby, located at and movable from this end of the rolls so as to uncover the entrance end of the mold, and the ejector adapted to operate upon the cigar from the opposite end of said mold, said thimble-support and ejector being connected to move simultaneously and together, substantially as and for the purposes hereinbefore set forth.

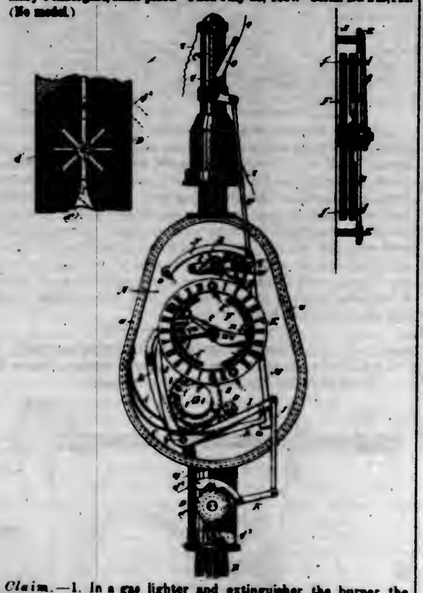


8. The combination of the rolls, the table, and the guide-plate pivoted or hinged above the plane of the table and adapted to tilt with relation to the table, substantially as and for the purposes hereinbefore set forth.

388,175. TWISTER FOR FENCE-WIRES. JOHN M. BOEHM, Jeffersonville, Ill. Filed Dec. 19, 1887. Serial No. 258,253. (No model.)

Claim.—In a twister for fence-wires, the combination of a bar, A, having a bifurcation, B, crotch *a*, pins or guides *b b*, channels *d*, anti-friction rollers *g*, and handles *c*, all constructed and adapted to operate substantially as and for the purpose set forth.

388,176. LIFTING-JACK. CHARLES R. BRADLEY, Dawson, Pa., assignor to L. L. Gerard and William H. Egbert, both of same place. Filed Feb. 15, 1888. Serial No. 264,121. (No model.)



Claim.—1. The combination, with a lever, of a depending limb having a laterally-projecting arm thereon and a bracket-arm having a spindle thereon, substantially as set forth.

2. The combination, with a lever, of a depending sliding limb, an arm adjustably secured thereto, and a sliding bracket-arm having a spindle thereon, substantially as set forth.

3. The combination, with a lever provided with a pivoted block on one end, of a depending limb, a vertically-adjustable arm placed on this limb, a sliding bracket-arm mounted on the lever, and a spindle affixed to the lower end of this bracket-arm, substantially as set forth.

4. The combination, with a lever bent at one end, and a block that is hollowed on its lower side and is pivoted to rock on the lower end of the bent portion of the lever, of a depending limb which has an offset in its body, an arm which is adjustably located on this limb to project from one side, and a sliding bracket-arm provided with a spindle which extends from its lower end toward the block pivoted to the bent end of the lever, substantially as set forth.

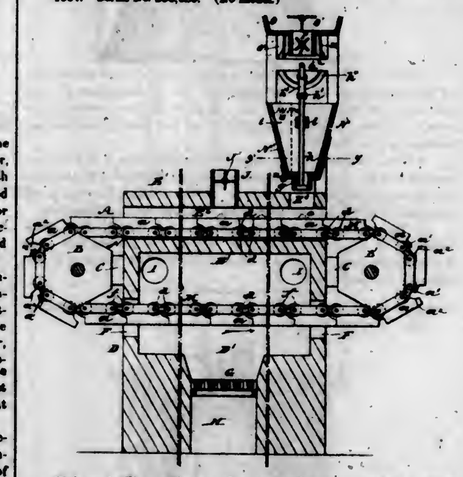
388,177. AUTOMATIC GAS LIGHTING AND EXTINGUISHING DEVICE. RICHARD F. BRINSWELL, San Francisco, Cal., assignor, by direct and mesne assignments, of two-thirds to Henry H. Allen and Mary Pendergast, same place. Filed July 23, 1887. Serial No. 245,141. (No model.)

Claim.—1. In a gas lighter and extinguisher, the burner, the valve controlling the admission of gas to the burner, a pivoted lever, and connections with the valve for operating it, in combination with a lighting apparatus for lighting the gas at the burner, a pivoted spring-actuated lever and connections with the lighting apparatus for operating it, and the rotary cams for operating the two levers successively, whereby the gas is turned on and off at the valve and lighted and extinguished at the burner, substantially as described.

2. In a gas lighter and extinguisher, the burner, the valve controlling the admission of gas to the burner, a pivoted lever, and connections with the valve for operating it, a lighting apparatus for lighting the gas at the burner, a pivoted lever, and connections with the lighting apparatus for operating it, and a spring engaging said lever, in combination with a rotary cam for operating the two levers successively, whereby the gas is turned on at the valve and lighted at the burner, and a second succeeding rotary cam for operating the first lever, whereby the gas is turned off at the valve and extinguished at the burner, substantially as described.

3. In a gas lighter and extinguisher, a burner and a pivoted electrical sparking-lever, and an actuating-spring for said lever, in combination with rotating cams and pivoted bell-crank lever, one end of which is in the path of said cams, whereby it is operated, a spring actuating said bell-crank lever, a pivoted curved lever having rack-teeth, and gearing with which it meshes to regulate its movement, a link connecting the bell-crank lever with the curved lever, and a link connecting said curved lever with the sparking-lever, substantially as herein described.

4. In a gas lighter and extinguisher, the burner, a rotary valve controlling the admission of gas to the burner, and a pivoted electrical sparking-lever having a spring to return it to position, in combination with succeeding rotary cams, independent bell-crank levers having each one end in the path of the cams, whereby each is operated successively by each cam, springs for returning levers to position, a pawl-and-ratchet mechanism for operating the valve, connecting levers and links between said mechanism and one of the levers, and connecting-links between the other of said levers and the sparking-lever, substantially as described.



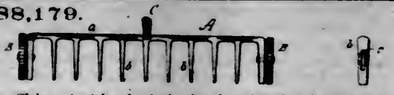
5. In a gas lighter and extinguisher, the burner, a rotary valve controlling the admission of gas to said burner, and a pivoted electrical sparking-lever having a spring to return it to position, in combination with succeeding rotary cams mounted adjustably, a fixed dial by which said cams are accurately adjusted, independent bell-crank levers having each one end in the path of the cams, whereby each is operated successively by each cam, springs for returning the levers to position, a pawl-and-ratchet mechanism for operating the valve, connecting levers and links between said mechanism and one of the levers, and connecting-links between the other of said levers and sparking-lever, substantially as described.

6. In a gas lighter and extinguisher, a burner, a gas-conduit, a valve by which the admission of gas to the burner is controlled, and an electrical sparking-lever for lighting the burner, in combination with a fixed dial and a hand moving over said dial to indicate the time, a wheel moving with the hand, cams adjustably secured to the wheel, pivoted levers operated by the cams, and connections from said levers by which the valve and the sparking-lever are operated, substantially as herein described.

7. In a gas lighter and extinguisher, a burner, a casing having passages for the gas in its walls, and a pipe communication at the bottom of said passages, and a burner at the top, in combination with the rotary valve controlling the inlet of the gas, the sparking-lever for lighting the gas at the burner, rotary adjustable cams on the face of the casing, the fixed dial, whereby the cams may be adjusted to the proper time, the pivoted levers operated by the cams, and connections between said levers and the valve and sparking-lever, substantially as herein described.

8. In a gas lighter and extinguisher, a burner, a gas-conduit, a valve controlling the admission of gas to the burner, and an electrical sparking-lever for lighting the gas at said burner, in combination with rotary cams, pivoted spring-actuated levers operated by said cams, connections from said levers to the valve and sparking-lever, whereby they are operated, and the adjustable rotary disk T, having the lug *t*, adapted to come in contact with the levers, whereby they are held out of position during any given period, substantially as herein described.

388,178. DRIER. ARTHUR DIBB, New York, N. Y. Filed May 18, 1887. Serial No. 238,023. (No model.)

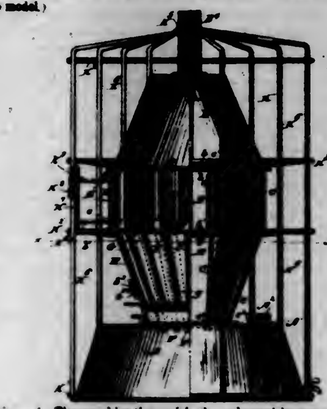


Claim.—1. The sections *a* of porous refractory material secured to suitable frames and connected together to form an endless apron, and the drums B B', over which the apron passes, in combination with the furnace having openings F to the fire-box for the lower part of the apron and a drying-oven above, the hopper N, and means for dropping the material from the hopper to each of the sections *a*, substantially as described.

2. The furnace formed with the apertures F and oven F' above the bridge E, in combination with the drums B B' and the endless drying-apron A, arranged to pass through said apertures and oven over the bridge E, substantially as shown and described.

3. The hopper N, having numerous apertures in its bottom and plungers working therein and a hinged side held normally closed by springs, in combination with a rotary feed-valve in the upper primary hopper and means, substantially as described, whereby the outward movement of the side N' throws the feed-valve out of action, substantially as described.

388,179. LAWN-RAKE. JOSEPH W. CALEF, North Boston, assignor of one-half to William T. Andrews, Boston, Mass. Filed Apr. 14, 1888. Serial No. 270,657. (No model.)

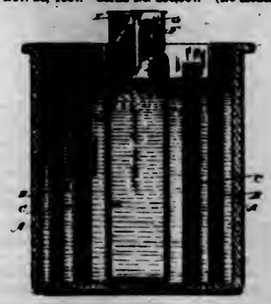


388,179.

Claim.—1. A hand-rake having slotted teeth and wheels provided with bearings which are adjustable in said slot, substantially as set forth.

2. The hand-rake A, composed of the back *a*, teeth *b b*, and handle D, combined with the wheels B B, mounted in the adjustable block *d*, the slots *c c*, and the fastening-nuts *e*, substantially as described.

388,180. CAR-HEATER. GEORGE W. CARTER and WILLIAM T. PICKETT, Canyonville, Oreg. Filed July 13, 1887. Serial No. 244,209. (No model.)



Claim.—1. The combination, with the enlarged base-reservoir A, of the base-section B, middle section, B', and crown-section B², each provided with flanges and tie-rods or bolts C, located outside of and around the stove, passing through the base and through said flanges, substantially as described.

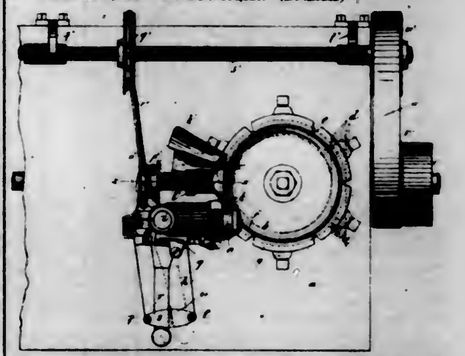
2. The combination, with the water-reservoir base A, of the stove-sections B B' B², rings D D', secured between the sections B B', and pipes E, communicating with the reservoir, passing through the ring D, and terminating below the deflector-plate D', substantially as described.

3. The combination, with the water-reservoir base A, of the stove-sections B B' B², rings D D', secured between the sections B B', pipes E passing through, and pipes F terminating beneath the ring D, substantially as described.

388,181. GALVANIC BATTERY. HOWARD CASSARD, Baltimore, Md. Filed Nov. 23, 1887. Serial No. 256,267. (No model.)

Claim.—1. A galvanic battery consisting of a jar having an acidulated exciting-fluid, a porous cell or bottle immersed in the same and containing an oxidizing agent, and an oxidizable metal and an electrode, both immersed in the same exciting-fluid, substantially as and for the purpose described.

2. A galvanic battery consisting of a jar having an acidulated exciting-fluid, a porous cell immersed within the same and having an oxidizing agent and a hermetically-sealed mouth, and an oxidizable metal and an electrode, both immersed in the exciting-fluid outside of the porous cell, substantially as and for the purpose described.



3. The combination, with a galvanic battery, of a cover formed as a cup with a liquid seal, and a heat tube communicating with the fusing-cell of the battery and trapped in the liquid seal, substantially as and for the purpose described.

388,182. LAST-BLOCK FASTENER. WILLIAM OSBY, New York, N. Y., assignor to himself and Paul D. Reed, same place. Filed June 20, 1887. Serial No. 242,073. (No model.)

Claim.—The improved last, consisting of the body, the last-block having in its under side a slot, 14, open at its upper end, the block being formed with a countersunk recess, and the fastener having a shank connected with the last-body and constructed with a flattened head, the under side of said head being fitted to the wall of the countersunk recess, and the head and slot being suitably formed relatively to permit the removal of the block when the head is turned into alignment with said slot, the head when turned into alignment with the slot presenting no projection beyond the line of the base-wall of the slot 14 for a short distance below the upper open end thereof, whereby in removing the block it may be slipped back a short distance before it is lifted, substantially as set forth.

388,183. TRIMMING DEVICE FOR KNITTING-MACHINES. EDGAR C. COVELL, ELISHA S. CRAM, and WILLIAM R. SHERMAN, Laconia, N. H. Filed June 7, 1888. Serial No. 276,289. (No model.)

Claim.—1. The improvement in the art of manufacturing and finishing a knit fabric, which consists in picking or running a single course of stitches of a previously-knit fabric on the needles of a knitting-machine, leaving an edge or portion of such fabric projecting from the needles, and then proceeding with the knitting in such single picked-on course, and simultaneously therewith trimming off such single projecting edge, substantially as hereinbefore set forth.

2. The improvement in the art of manufacturing and finishing a knit fabric, which consists in picking or running on the needles a previously-knit fabric, then proceeding with the knitting of the same, and simultaneously trimming off such projecting edge, leaving a course or fractional part of a course of loops of such trimmed-off edge in the line of loops or stitches by which the previously-knit fabric was picked on the needles, and fulling such first-mentioned course or fractional part of a course into said last-mentioned course or line of loops, as set forth.

3. The combination, with a needle-head and its needles, of trimming-knives, substantially as described, located in close proximity to the needles, whereby an edge projecting from the needles may be trimmed off close to the main fabric as the knitting progresses, substantially as hereinbefore set forth.

4. A rotary trimming-knife, *c'*, having a concaved face, said concave form of face extending from its periphery or cutting-edge inward toward its center, substantially as and for the purpose hereinbefore set forth.

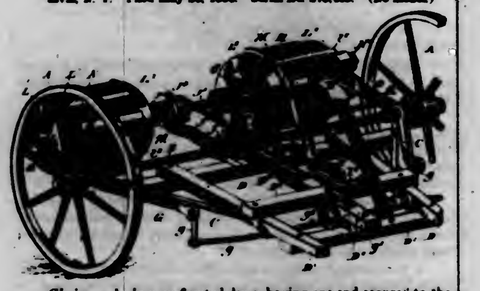
5. The combination, with the needle-head and its needles, of a stationary knife and a rotary knife, *c'*, adapted to co-operate therewith, said rotary knife having a concaved face, and said concave form of face extending from the periphery or cutting-edge of the knife inward toward its center, whereby provision is made for the operation of the knife close to the needles without interference with the beards or hitches of the latter, substantially as and for the purpose hereinbefore set forth.

6. The combination, with the needle-head and needles of a knitting-machine, of a rotary and a stationary trimming-knife adapted to trim an edge projecting from the needles, said rotary knife having a concaved face, and said stationary knife being provided with the guiding-finger *j'*, for bringing the projecting edge into proper position to be trimmed off, substantially as set forth.

7. The combination, with the needle-head and needles of a knitting-machine, the needle-head being provided with clamping-sections beveled on their upper outer edges, of a rotary and a stationary trimming-knife adapted to trim an edge projecting from the needles, said stationary knife being provided with a guiding-finger, *j'*, arranged close to the beveled edge of the clamping-sections, for bringing the projecting edge into proper position to be trimmed off, substantially as set forth.

8. The combination, with the needle-head and needles of a knitting-machine, of a trimming mechanism, substantially as set forth, for trimming off a projecting edge of a fabric picked on the needles, a movable support for said trimming mechanism, means for operating the trimming mechanism and needle-head, and devices, substantially as explained, for moving said support to bring the trimming mechanism into operative or inoperative position, substantially as set forth.

9. The combination, with the needle-head and needles of a knitting-machine, of a trimming mechanism adapted to trim off an edge of a picked-on web projecting from the needle, the guiding-finger *j'*, and guide or head *k'*, substantially as and for the purposes set forth.



10. The combination, with the needle-head and needles of a knitting-machine, of a trimming mechanism comprising a rotary knife having a concaved face and a stationary knife adapted to co-operate with said rotary knife for trimming off an edge of a fabric projecting from the needles, and means for adjusting said trimming-knives nearer to or farther from the needles, substantially as set forth.

11. The combination, with the rotary cutter and its shaft, of the fast and loose pulleys, having their faces formed substantially as herein shown and described, and means for adjusting the position of said shaft and pulleys for shipping the belt, as set forth.

12. The combination, with the rotary and stationary cutter, of the oil-cup *n'*, provided with a "packing" in contact with the rotary knife, for applying a lubricant to the cutters, as set forth.

13. The combination, with the rotating head, of the push-back, clearing-wheel, and trimming device, located in the rear of the clearing-wheel and front of the push-back, as set forth.

388,184. POWDER-DUSTING MACHINE. EARL A. DOREMUS, Batavia, N. Y. Filed May 28, 1888. Serial No. 275,023. (No model.)

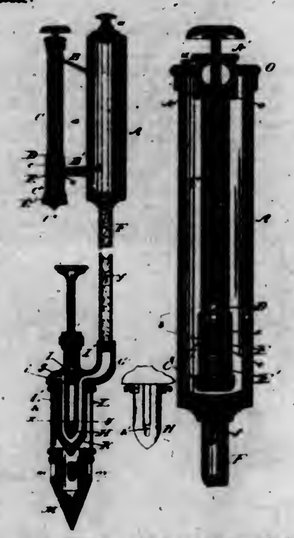
Claim.—1. In a perforated drum having one end secured to the solid metallic head peripherally attached to the drum-head mounted upon the drum-carrying shaft, the feed-opening in the metallic head, provided with longitudinal ribs upon each side thereof, and the feed-cover inclosing the opening and adapted for sliding in grooves in the ribs, in combination with the drum-operating mechanism, arranged substantially as described, and for the purpose hereinbefore set forth.

2. The drum-head having the hub attached thereto, the set-screw in the hub, the hub-carrying shaft, the peripheral metallic head, the perforated shell, the drum-head made adjustable upon the shaft, the head peripherally attached to the drum-head, and the drum-supporting frame, in combination with the operating mechanism, arranged substantially as described, and for the purpose hereinbefore set forth.

3. The perforated drum, the longitudinal slide-ribs upon the periphery of the same, the feed-distributing slides adjustably held in position by the ribs, the drum shaft, and the drum-supporting frame, in combination with the operating mechanism, arranged substantially as described, and for the purpose hereinbefore set forth.

4. The perforated drum, the shaft carrying the same and having the sprocket-wheel mounted thereupon, the carrying and operating wheels, and the revolving wheel-axle having the sprocket-wheel and cloth mounted thereupon, in combination with the raising and lowering mechanism, all arranged and operating substantially as described, and for the purpose hereinbefore set forth.

388,185. BLUE AND COLORING-MATTER. CARL DUISBERG, Elberfeld, Germany. Filed Dec. 14, 1885. Serial No. 185,865. (Specimens.) Patented in Germany Nov. 19, 1885, No. 33,892; in England Nov. 24, 1885, No. 14,494, and in France Dec. 19, 1885, No. 173,062.



Claim.—The coloring-matter herein described, which is produced by the action of tetrazo-diphenoldiethyl ester (ether) upon the alpha-naphthol alpha-mono sulpho-acid, and which is a black amorphous powder with a bronze hue, forming a violet solution when dissolved in water, being changed with alkali to red, and with concentrated sulphuric acid produces a deep indigo-green-blue color, and dyes cotton not mordanted in an alkaline-soap bath blue, fast to soap and mineral acids, differing from the homologous product of the Letters Patent No. 357,273 by the composition of $2(CH_2)$, substantially as described.

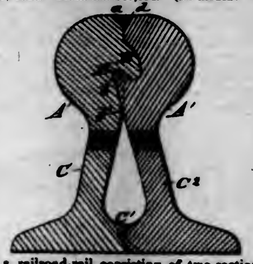
388,186. STEM WINDING AND SETTING WATCH. JULES DUPLAIN, Montreal, Quebec, Canada. Filed June 12, 1888. Serial No. 276,513. (No model.)

Claim.—The combination, in a watch arranged for stem-winding and hand-setting by the crown, of a stem, A', having a collar, *m*, said stem being attached to the crown, with crown *g* and with spring *s*, having catch *k*, and opening *r*, through which the end *l* of the stem A' passes, the whole substantially as described.

388,187. SELF-HEATING SOLDERING-IRON. THEODORE W. EVERELS, Martinsburg, W. Va. Filed Mar. 20, 1888. Serial No. 267,888. (No model.)

Claim.—1. A self-heating soldering-iron having the hollow handle A, the pump-barrel C, plunger D, valve-chamber C', communicating with the interior of the handle, and the spring-actuated valve E, substantially as and for the purpose set forth.

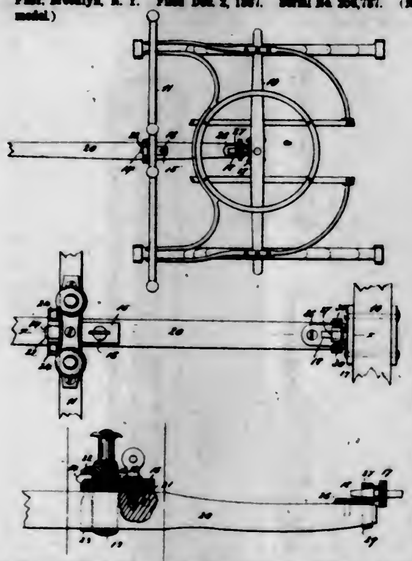
2. A self-heating soldering-iron having a hollow handle and a force-pump located inside of said handle, substantially as and for the purpose set forth.



3. A self-heating soldering-iron having a base-piece, G, a U-shaped gas-generator, H, a gas-chamber, *g*, and opening *i*, and a pointed valve, I, substantially as and for the purpose set forth.

4. The combination, with the U-shaped gas-generator H, of the hood K, having a conical tip provided with the slits *k*, substantially as and for the purpose set forth.

5. The combination, with the U-shaped gas-generator H, having the chamfers *h'*, of the hood K, having a conical end provided with slits *k*, a perforated shield, L, surrounding the hood, and a hollow tip, M, having openings *m*, substantially as and for the purpose set forth.



6. A self-heating soldering-iron consisting of the hollow handle A, provided with a pump, the pipe F, containing the wicking *f*, the base-piece G, having the gas-chamber *g* and opening *i*, the gas-generator H, communicating with the pipe F and the gas-chamber *g*, the valve I, the hood K, shield L, having pan L', and hollow tip M, substantially as and for the purpose set forth.

388,188. **RAILROAD-RAIL.** Jeremy A. Ewing, Jackson, Ohio. Filed Feb. 20, 1888. Serial No. 265,051. (No model.)

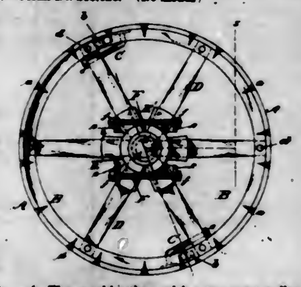
Claim.—In a railroad-rail consisting of two sections, A and A', having independent outwardly-inclined webs, the combination, with the section A, provided with a vertical head-surface, *a*, longitudinal downward-curved rib B, head-recess *b*, and base-recess C, of the interlocking section A', provided with a vertical head-surface, *d*, recess *d'*, the upwardly-inclined rib E, and base projection *e*, all combined substantially as and for the purpose specified.

388,189. **POLE ATTACHMENT FOR VEHICLES.** William P. Fish, Brooklyn, N. Y. Filed Dec. 2, 1887. Serial No. 256,757. (No model.)

Claim.—1. The combination, with a vehicle running-gear, of longitudinally-extending spurs carried thereby and a pole provided with eyes, one in advance of the other, to receive the said spurs, adapted to receive said spurs, substantially as described.

2. The combination, with a vehicle running-gear provided with forwardly-extending spurs and a rearwardly-extending projection, of a pole provided with eyes adapted to receive the spurs, and with a plate formed with a threaded aperture, and a binding-screw which passes through an aperture formed in the rearwardly-extending projection of the running-gear and engages the threaded aperture of the pole-plate, substantially as described.

3. The combination, with a pole, of plates connected thereto and formed with eyes, a plate arranged for connection with the vehicle running-gear and formed with a forwardly-extending spur and a rearwardly-extending and apertured projection, a set-screw arranged to pass through the aperture of the rearwardly-extending projection and to engage the threaded aperture formed in one of the pole-plates, and a second plate or iron, also arranged for connection with the vehicle running-gear and formed with a forwardly-extending spur or dowel arranged to enter the eye of the second pole-plate, substantially as described.



4. The combination, with a pole, of a plate, 21, a clip, 23, by which the plate is connected to the pole, an eye, 22, formed upon the plate, a second plate, 26, a clip, 29, by which the plate is connected to the pole, an eye, 27, formed upon the plate, an iron or plate, 12, arranged for connection with the draw-bar of the vehicle running-gear, a pole-socket, 13, a forwardly-extending spur or dowel, 14, and a rearwardly-extending plate, 15, a binding-screw, 16, passing through an aperture formed in the plate 15 and engaging a threaded aperture formed in the plate 21, and a plate or iron, 17, arranged for connection with the bottom-bed and formed with a forwardly-extending spur or dowel, 18, that is arranged to enter the eye 27, substantially as described.

5. In a pole attachment, the iron 12, having a pole-socket, 13, a forwardly-projecting spur, 14, and a rearward extension, 15, having an aperture, substantially as set forth.

6. The combination, in a pole attachment, with the iron 12, having a pole-socket, 13, a forwardly-projecting spur, and a rearward extension, 15, having an aperture, of the pole-plate having an eye, 22, receiving said spur, and a screw-threaded aperture to register with the aperture in the said extension, and a set-screw, 16, for said apertures, substantially as set forth.

7. In a pole attachment, the combination, with the rear pole-iron, 26, having a longitudinal eye, 27, and a pole-clip, 29, of the running-gear plate 17, having a forwardly-projecting spur, 18, to enter said eye, substantially as set forth.

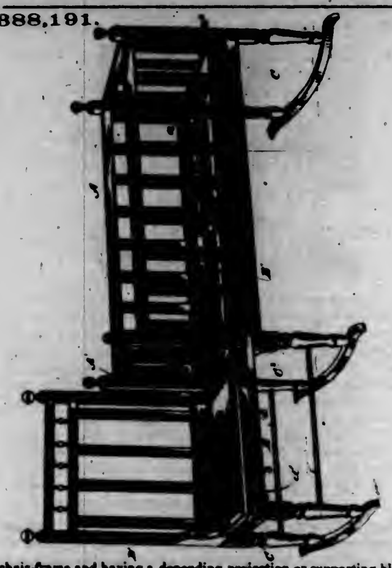
388,190. **SPLIT PULLEY.** Wallace L. Field, Menasha, Wis., assignor of three-fourths to John Strange, same place. Filed Feb. 4, 1888. Serial No. 263,089. (No model.)

Claim.—1. The combination, with a two-part pulley, of the bent bolts C, secured, respectively, to each part and passing through a spoke on the other part, substantially as described.

2. A two-part pulley having a rim, A, composed of two semicircular sections, each section being united to a semicircular folly, B, the rim overlapping the folly at one end and the folly projecting beyond the rim at the other end, and dowel-pins *b*, uniting the meeting ends of the follies, substantially as described.

3. A two-part pulley having a hub made in halves and united by bolts, each half having weakened portions, whereby it is caused to clamp the shaft in radial lines, some of which are not parallel with the bolts, substantially as described.

4. In a two-part pulley, a hub made in halves, each half having bosses E cored out to form sockets for the spokes and separated to leave weakened portions *z* between them, the bosses nearest the meeting edges of the halves of the hub being provided with lugs *e* to receive the clamping-bolts, substantially as described.



388,191. **COMBINED CRADLE AND ROCKING-CHAIR.** William Fuel and Rudolph Pfaehler, Lost Haven, Pa. Filed May 5, 1888. Serial No. 273,008. (No model.)

Claim.—1. The combination of the cradle-frame, the chair-frame movable into and out of the cradle-frame, and the chair-seat pivotally supported on the chair-frame, whereby it may be turned for use at right angles to the cradle-frame, or may when not in use be adjusted into line with and telescoped in said cradle-frame, substantially as set forth.

2. The combination of the cradle-frame having ways for the chair-frame extending to one end of the cradle-frame, and having each end of the frame practically recessed, the chair-frame fitted to said ways, and the seat pivotally supported on the chair-frame and having a back fixed to it and fitted to the recess of the cradle-frame, the chair-frame being movable into the cradle-frame, substantially as set forth.

3. The combination of the cradle-frame, the chair-frame movable within said cradle-frame, and the seat pivotally supported on the chair-frame and having a depending projection or supporting-block at its front edge, the chair-frame being provided with a bar or bearing for engagement by said supporting-block, substantially as set forth.

388,191.

4. In combination with the cradle-frame and the chair-frame, the seat on said chair-frame, and the back supported pivotally on said chair-frame, whereby it may be turned from its normal position to one at right angles thereto, the chair-frame being movable with reference to the cradle-frame, whereby the chair-back when adjusted to its latter position may be adjusted flat against the end of the cradle-frame, substantially as set forth.

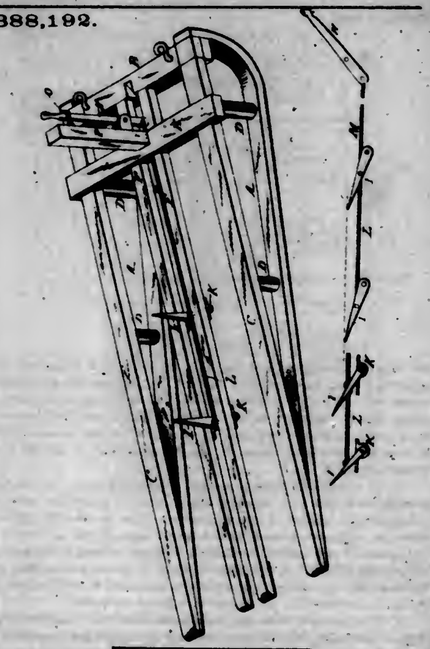
5. The combination, with the chair-frame having a headed stud or studs and the seat pivotally supported on said frame, and having a piece or plate fixed to it and notched to engage the said stud below its head, substantially as set forth.

6. The combination of the chair-frame having the headed studs, the seat, the bar or plate fixed to the under side of the seat and having slots to receive the headed studs, and the pivot-bolt, substantially as set forth.

7. In a combined chair and cradle, the combination of the cradle-frame, the chair-frame movable into and out of the cradle-frame, and the seat pivotally supported on the chair-frame and having a depending projection or block at or near its front edge, the front bar of the chair-frame being arranged for engagement by and to provide a bearing for the supporting-block when the seat is adjusted to position for use, substantially as set forth.

8. The combination, in a combined cradle and chair, of the cradle-frame, the chair-frame movable into and out of the cradle-frame, the seat, the bolt pivoting said seat to its frame, and the spring on said bolt, substantially as set forth.

9. The chair-frame having a cross-bar formed with a recess in its upper side having beveled or inclined walls, the seat supported on said frame and having a bar or plate fitted to enter the recess in the cross-bar, and the pivot-bolt passed through the base-wall of the recess, substantially as set forth.

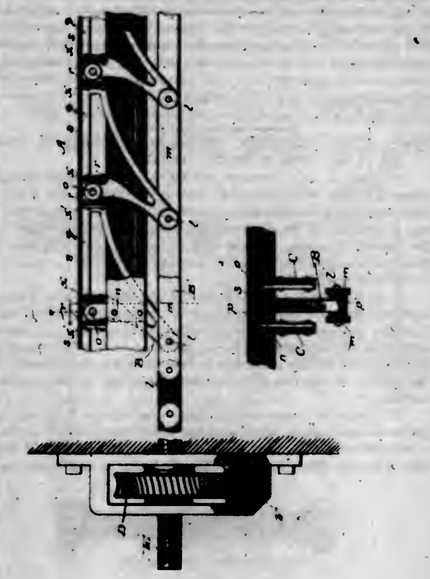


388,192. **DUMPING-SLED.** Richard Gibbs, Auburn, Ind. Filed May 7, 1888. Serial No. 273,603. (No model.)

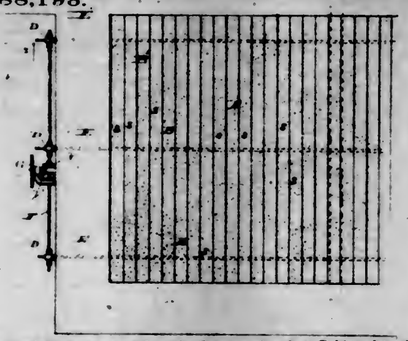
Claim.—1. The combination, in a sled, of runners having plates inclined from above the bend at the front to nearly the level of the ground at the rear, cross-bars at the front connecting said runners, and intermediate string-pieces inclined from front to rear, the rear ends of said pieces resting on the ground, substantially as described.

2. The combination, with a sled having an upper platform inclined from front to rear, of movable teeth extending above the surface of said platform when turned up, and a holder to retain said teeth in upright position.

3. In a farm-sled, the combination of the runners, an inclined platform consisting of longitudinal bars to support the load, pivoted teeth extending above the platform when turned up, connecting links and rods, as described, and a lever connected to said rods by which the teeth may be manipulated, as set forth.



388,192.



388,193. **MALT-KILN FLOOR.** William Griesser, Chicago, Ill. Filed May 19, 1887. Serial No. 238,764. (No model.)

Claim.—1. A malt-kiln floor formed in sections *s*, each having flanges *r* extending from its lower side near opposite edges, beams C, upon which the sections are supported at the flanges *r*, brackets B, hinged to the supports C near corresponding edges of the sections and extending across and secured to the lower sides of the said sections, and means, substantially as described, for actuating the brackets, substantially as and for the purpose set forth.

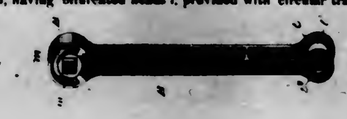
2. A malt-kiln floor formed in sections *s*, each having flanges *r* extending from its lower side near opposite edges, beams C, upon whic

388,193.

the sections are supported at the flanges *r*, brackets B, hinged to the supports C near corresponding edges of the sections and extending across and secured to the lower sides of the said sections, a reciprocating bar, F, transverse to the sections and to which the brackets are pivotally connected near their lower ends, and means, substantially as described, for reciprocating the bar F, substantially as and for the purpose set forth.

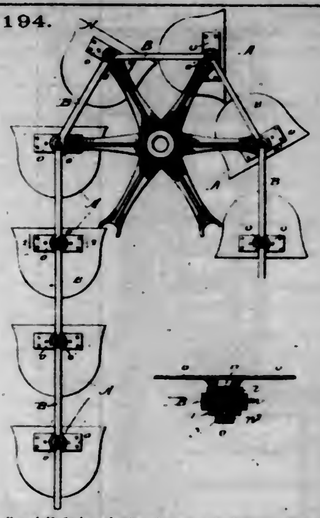
3. In a malt-kiln floor, a section, *s*, having flanges *r* extending from its lower side near opposite edges, at which flanges the section is supported, a bracket, B, hinged near one corner to the said support below the said section and toward a lateral edge thereof and extending across the said section, to which it is rigidly secured, a transverse reciprocating bar, F, to which the bracket is pivotally connected at its lower end, and means, substantially as described, for reciprocating the bar F, substantially as and for the purpose set forth.

4. In a malt-kiln floor, the combination of sections *s*, each having flanges *r* extending from its lower side near opposite edges, supporting-beams C, upon which the sections rest directly at their flanges *r*, brackets B, rigidly secured to the under sides of the sections and hinged near the edges thereof, at which the sections are tilted for dumping, to the supporting-beams, reciprocating bars F, pivotally connected with the brackets near their lower ends, threaded extensions E upon the reciprocating bars, internally-threaded coupled gear-wheels D upon the threaded extensions, a shaft, F, having worm-threads engaging with the gear-wheels D, and means for turning the shaft F, substantially as and for the purpose set forth.



5. A malt-kiln floor comprising, in combination, sections *s*, having vertical flanges *r*, supporting-beams C, upon which the sections rest directly at their flanges, brackets B, rigidly secured in transverse rows to the under surfaces of the sections between the flanges *r* and hinged to the supporting-beams near the edges of the sections upon which they are tilted for dumping, transverse reciprocating bars F, one for each transverse row of brackets, to which they are pivotally connected, and all connected from their adjacent extremities to be operated simultaneously, and means, substantially as described, for reciprocating the bars F, substantially as and for the purpose set forth

388,194. CONVEYER. William Greenbon, Chicago, Ill. Filed Oct. 14, 1887. Serial No. 252,251. (No model.)



Claim.—1. In a conveyer, endless chains and scoops having arbors provided with non-pivotal bearings for links of the endless chains extending from the scoops in one direction, and pivotal bearings for the ends of the adjacent links extending from the scoops in the opposite direction, whereby each scoop is caused to maintain a fixed position with relation to the direction in which it travels, substantially as described.

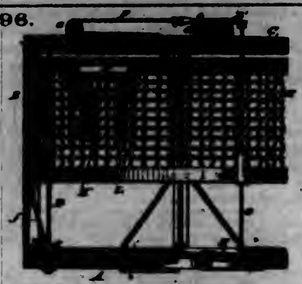
2. In a conveyor, endless chains carrying scoops having arbors, each provided with two pivotal bearings and a non-pivotal bearing, and links, each provided at one end with circular openings to fit upon the pivotal bearings of the arbor of one scoop, and at the opposite end with a non-circular opening to fit upon the non-pivotal bearing of the arbor of an adjacent scoop, substantially as and for the purpose set forth.

3. A conveyor comprising, in combination, scoops A, linked together in endless series, plates upon the scoops having arbors *a'*, provided with circular bearings *n* and n^2, and angular bearings *n'* and links B, having bifurcated heads *l*, provided with circular transverse

388,194.

openings l' and l^2, fitting the bearings *n* and n^2, respectively, and solid heads *m*, provided with angular transverse openings *m'*, fitting the bearings *n'*, the whole being constructed and arranged to operate substantially as and for the purpose set forth.

388,195. LAMP-STANDARD. William H. Harrison and J. Gilbert Meehan, Meriden, Conn., assignors to Edward Miller & Company, same place. Filed Mar. 3, 1888. Serial No. 266,546. (No model.)



Claim.—1. In a lamp-standard, the combination of the outer tube and an inner tube or rod arranged vertically within said outer tube, the one fixed, the other adjustable, a cramp substantially of ring shape arranged in a chamber in the stationary tube and supported therein upon a bearing, so as to be free to swing up and down, and also free for a certain amount of rotation, the said cramp surrounding the inner tube and adapted to engage therewith, so as to partake of the rotation which may be imparted to said tube, and a cam stationary in said cramp-chamber, upon which the free side of said cramp is adapted to ride under rotation imparted to it, substantially as described, and whereby such rotation of the inner tube and cramp will impart corresponding rise or fall to the cramp.

2. The combination of the outer tube, A, a concentric chamber, E, forming substantially a part of said outer tube, the inner tube, B, vertically adjustable within said outer tube and through said chamber, the said chamber constructed with the horizontal ledge G upon one side and with a stationary cam, I, presenting inclined surfaces J upon the side of the inner tube substantially opposite the said ledge G, with the ring-shaped cramp F around said inner tube, constructed with a projection from one side to rest upon said ledge, and upon its opposite side with the projection K, adapted to engage said cam, the said inner tube constructed of non-cylindrical shape, and the inside of the cramp of corresponding shape, substantially as described.

388,196. ANIMAL-TRAP. William H. Harden, Cadiz, Ga., assignor of one-half to Isaac R. Hagan and Wilson C. McCall, same place. Filed June 13, 1888. Serial No. 276,902. (No model.)

Claim.—1. The combination, with the top and bottom sections, A and C, and the intermediate pillars, B, of the falling cage E, arranged between the pillars and the top and bottom sections, the cord F, attached to the top of the cage and passing through a hole and around a pulley, *a*, of the top section, catch-bar *b*, having a notch in the same and attached to the cord, lip *c*, fixed to the top section and adapted to engage with the said notch, the vertical push-rod G, resting beneath the catch-bar *b* and extending through the top section to the bottom, and the treadle H, attached to the push-rod and forming a part of the floor of the bottom section, substantially as shown and described.

388,196.

2. The combination, with the top and bottom sections, A and C, and the pillars B, connecting them, the guide-rods D, also connecting the top and bottom sections parallel with the pillars, and having spiral springs *r* wound around their lower ends, the falling cage sliding on the guide-rods, spring-catch *f*, attached to the lower ends of the pillars and adapted to engage the cage when down, and suspending and tripping mechanism, substantially as shown and described.

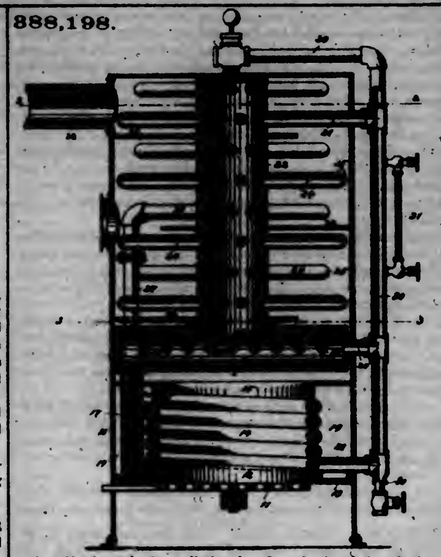
3. The falling cage E, having side inlet, I, having at its inner end an inclined door, *g*, and at its outer end a cut-off door, A, fulcrumed horizontally and having its inner end turned up, as described.

4. The falling cage E, having the top inlet, J, with horizontally-hinged doors K K, provided with counter-weights L L, for holding them together, substantially as shown and described.

388,197. HANDLE ATTACHMENT FOR FILES AND SIMILAR TOOLS. Daniel Harkins, Hudson, Mass. Filed May 8, 1888. Serial No. 273,179. (No model.)

Claim.—1. A file or similar tool having two or more working-surfaces and provided with a shank projecting from one end, and also provided with two transverse notches formed in the end of said file a distance apart equal to the thickness of said file, in combination with a handle provided with a transverse hole through which said shank is adapted to pass, and also provided with two ribs so located and of such a size as to enter and fit said notches in the end of said file or similar tool when it is desired to use one of its broader surfaces, or between which the end of the file is adapted to enter and be held in position thereby when it is desired to use one of its narrower surfaces, and a nut mounted upon the outer end of said shank to clamp said handle to said file or similar tool at right angles to its working-surfaces.

2. A file or similar tool having a threaded shank projecting from one end, and also provided with a transverse notch on either side thereof cut into or formed in the end of said file, in combination with a handle provided with a transverse hole through which said shank is adapted to pass, and also provided with two parallel ribs so located and of such a size as to enter and fit said notches in the end of the said file or similar tool, and a nut mounted upon the outer end of said shank to clamp said handle to said file or similar tool at right angles to one of its working-surfaces.



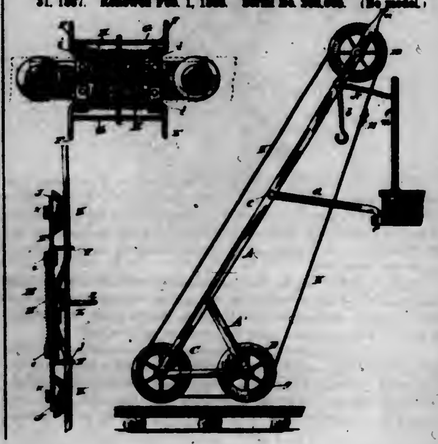
388,198. STEAM-BOILER. Samuel P. Hedges, Greenport, N. Y. Filed Jan. 27, 1888. Serial No. 262,113. (No model.)

Claim.—1. The combination, with an inverted-T-shaped stand-pipe provided with a series of horizontally-projecting tubes, of a coil encircling the fire-box, connected with said stand-pipe, and an outer delivery-pipe connected with said stand-pipe and the coil, substantially as shown and described, whereby a constant and thorough circulation is obtained, as set forth.

2. The combination, with an inverted-T-shaped stand-pipe provided with radiating horizontal capped tubes, of a coil encircling the fire-box and connected with the vertical member of the stand-pipe, and a delivery-pipe connected with the stand-pipe above the coil-connection, substantially as shown and described.

3. The combination, with an inverted-T-shaped stand-pipe and a

388,198.



series of horizontal tubes radiating therefrom, having their ends closed, of a coil encircling the fire-box, connected with the vertical member of the stand-pipe, an outer delivery-pipe connected to the vertical member of the stand-pipe above the coil-connection, and a tubular connection between the horizontal member of the stand-pipe, the coil, and delivery-pipe, all combined to operate substantially in the manner set forth.

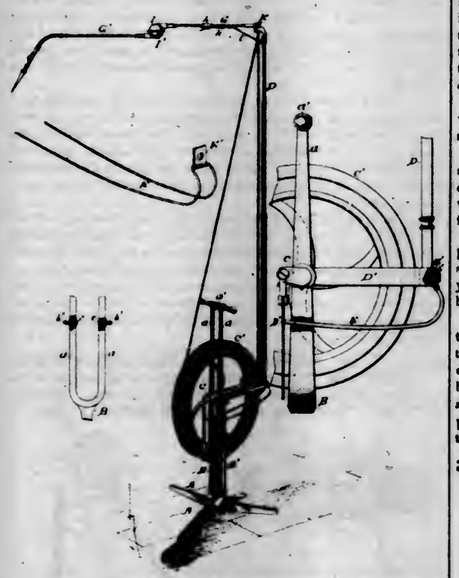
4. The combination, with an inverted-T-shaped stand-pipe provided with a series of horizontally-projecting tubes, a coil encircling the fire-box connected with the stand-pipe, and a steam-delivery pipe connected with the stand-pipe above the coil-connection, of a series of segmental baffle-plates alternately arranged above the horizontal member of the stand-pipe and top of the boiler, substantially as shown and described.

5. The combination, with an inverted-T-shaped stand-pipe, a series of horizontal tubes projecting from the same, a coil encircling the fire-box and connected with the stand-pipe about centrally thereof, and a supply-pipe connected to the vertical member of said stand-pipe near the top and to the horizontal member and coil, of a series of spaced segmental baffle-plates alternately arranged above the horizontal member of the stand-pipe and top of the boiler-casing, substantially as shown and described.

388,199. APPARATUS FOR PLACING TORPEDOES ON RAILROAD-TRACKS. Joseph R. H. Hedges, Baltimore, Md., assignor of one-half to the Vindust Manufacturing Company, same place. Filed Jan. 31, 1887. Renewed Feb. 1, 1888. Serial No. 262,695. (No model.)

Claim.—1. In apparatus for placing torpedoes on railroad-tracks, the combination of a yoke or frame and an auxiliary frame, grooved wheels journaled in said yoke, a similar wheel journaled in the auxiliary frame, having a continuous channel or recess, an endless band traversing said wheels, and a torpedo-clamp carried by the band, adapted to be tripped and to automatically embrace the flanges of a rail, substantially as described.

2. In torpedo-placing apparatus, the combination of the frame A, the grooved wheels B C, the auxiliary frame, and grooved wheel D, having continuous channel *g*, the endless band traversing these wheels and provided with trip-finger I, and the torpedo-clamp having spring-actuated arms held apart by said finger, substantially as described.



3. In torpedo-placing apparatus, the combination, with the endless belt or band, of a clamp holding at each end a torpedo and having spring-actuated arms for embracing a rail, and devices or means for holding said arms apart, adapted to be automatically tripped or released, substantially as and in the manner described.

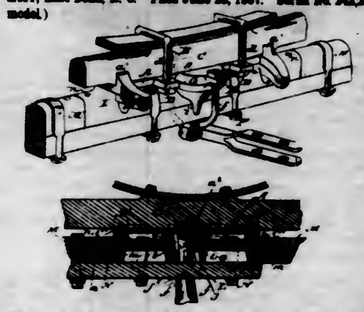
4. The combination, with the endless band, of the finger I, loosely held thereto, having its ends bent and formed centrally with the portion *l*, and the clamp E, provided with bent spring-actuated arm F F, having rib G, under which the ends of the trip-finger are turned, the whole operating in the manner set forth and described.

5. The combination, with an oblong strip of metal having at opposite sides the loops *i i*, of the bent arms F F, held in said loops and having rib G, and the springs surrounding said arms, with one of their ends bearing upon the ribs and the other upon the plate, substantially as described.

6. The combination, with the frame, supported as shown, of the hook *b* and springs N, substantially as and for the purpose described.

388,200. DENTAL ENGINE. JOHN HOOD and STEPHEN H. REYNOLDS, Boston, Mass. Filed Jan. 12, 1888. Serial No. 260,490. (No model.)

Claim.—1. In a dental engine, the combination of the base A, a bifurcated and rotating standard, B, the extension-bar D, with bifurcated arms extending at an angle from and pivoted to the bifurcations of said standard, and the handle *a'*, connecting the two parts of the standards above its attachment to the extension-bar, substantially as shown and described.



2. In a dental engine, the combination, with the standard and extension-bar having a bifurcated connection with said standard at right angles to the body of the bar, of the double spring E, attached to the bar and adjustable upon the standard, as specified.

3. In a dental engine, the combination of the extension-bar D with the shaft-carrying case G, the sleeve *h*, placed upon said case, the spring-dog *i*, attached to the sleeve, the rack *k*, sliding through the sleeve and engaging with the spring-dog, and the connecting-rod *l*, pivoted at one end to the rack and at the other to the extension-bar to form an adjustable brace for retaining the shaft-case G in any desired position with relation to the extension-bar, as specified.

4. In a dental engine, the combination of the shaft-cases G and G' with the cups I and I', attached by sleeves to said cases and connected together by flanges, forming a universal joint, the parts being adapted to turn one upon the other, substantially as shown and described.

5. In a dental engine, the shaft-cases G and G', united by a globular universal joint, in combination with the shaft inclosed in said cases, consisting of two rigid parts, H and H', within the cases, and the flexible wire coil J, connecting the rigid parts within the globular joint, substantially as shown and described.

388,201. FIFTH-WHEEL. JONATHAN G. HUEY and LEMUEL H. HUEY, Bent Bend, N. C. Filed June 20, 1887. Serial No. 242,200. (No model.)

Claim.—1. The combination of the axle-iron, the lower fifth-wheel section secured thereon and having a king-bolt opening formed through it leading to the axle-iron and provided with a keyway or slot; and the upper fifth-wheel section having a king-bolt provided with a key fitted to the keyway of the lower section, such king-bolt being extended through the opening in the lower section and bearing at its lower end on the axle-iron, substantially as set forth.

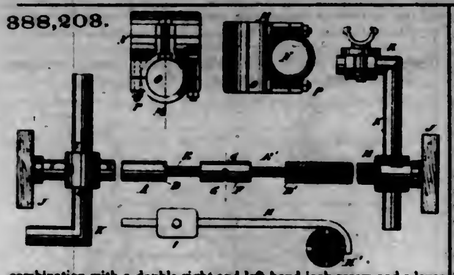
2. In a vehicle, a central metallic cap-section provided in its end with sockets fitted to receive the inner ends of the wooden axle-cap sections, substantially as set forth.

3. The combination of the axle-iron, the lower fifth-wheel section secured centrally thereto, the axle-cap formed in sections arranged on opposite sides of and secured at their inner ends to the lower fifth-wheel section and the upper fifth-wheel section, substantially as set forth.

4. The upper and lower fifth-wheel sections, combined with the perch-iron provided with a yoke having its arms extended upon opposite sides of the lower section and secured to the upper section, such yoke being provided with a central upwardly-projected stud, *f'*, all being adapted for use substantially as set forth.

5. The improvement in vehicles herein described, consisting of the lower section having its ends provided with sockets to receive the ends of the wooden axle-cap sections, and provided between its ends with a turn-table portion and concentrically thereof with a king-bolt opening having a keyway or slot, and the upper section having a socket to receive the turn-table portion of the lower section and provided with the king-bolt, formed with a key or feather, substantially as set forth.

388,202. INHALER. ALBERT E. IVES, Missoula, Mont. Filed Jan. 4, 1888. Serial No. 259,603. (No model.)

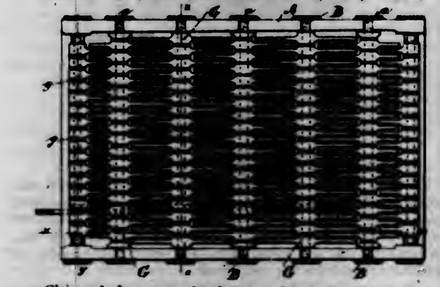


Claim.—The improved instrument for applying powdered medicinal substances to the nasal, throat, or lung cavities, the same consisting of the powder-receptacle having small perforations in its top and a suitable handle, the compressible air-bulb, and the flexible tube connecting it with said bulb, as shown and described, whereby the compression of the latter forces air into contact with the powder in the receptacle, whence it is expelled in jets that carry along some of the fine impalpable portion of the powder, as specified.

388,203. SUPPORT FOR ROCK-DRILLS. PATRICK KELLY, Poughkeepsie, assignor to Addison C. Rand, New York, N. Y. Filed May 13, 1887. Serial No. 238,126. (No model.)

Claim.—1. An extensible tunnel-bar divided into two parts, in

388,203.

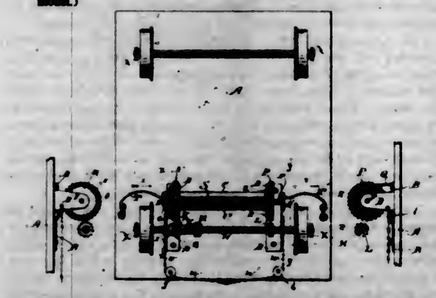


combination with a double right and left hand jack-screw and a lever and adjustable weight thereon for adjusting said bar and preserving said adjustment, substantially as described.

2. The combination, with an extensible tunnel-bar, of a drill-supporting arm bent at its upper end to an angle with the axis of said arm, substantially as described.

3. The combination, with an extensible tunnel-bar, of a drill-supporting arm bent at its upper end to an angle with the axis of said arm, and a three-part hub bored horizontally and vertically and adapted to support said arm upon the tunnel-bar, substantially as described.

4. The combination, with a rock-drill, of an extensible tunnel-bar, a bent drill-supporting arm, and a hub or supporting-bearing for said arm, substantially as described.



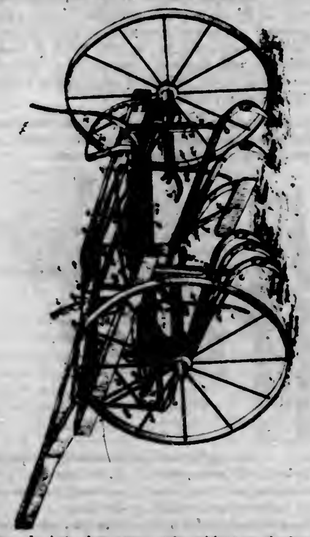
388,204. GRATE FOR FURNACES. THOMAS KIRKWOOD, New York, N. Y. Filed Nov. 4, 1887. Serial No. 254,203. (No model.)

Claim.—1. In a grate for furnaces, the combination, with supporting cross-bars, of fuel-bars formed in series with intermediary or dividing grooves *g*, whereby said fuel-bars are adapted to be separated, substantially as set forth.

2. In a grate for furnaces, the combination, with supporting cross bars B, of the fuel-bars G, cast onto the said cross-bars and formed in series with intermediary dividing-grooves *g*, whereby the said fuel-bars are rigidly attached to the said cross-bars and are adapted to be separated, substantially as set forth.

388,205. CAR BRAKE AND STARTER. DALLAS KNOWLTON, Brantford, Ontario, Canada. Filed Jan. 4, 1888. Serial No. 259,601. (No model.)

Claim.—1. In a car brake and starter, the combination, with one of the wheel-axles, a fixed driving and a loose winding pinion on said axle, and a clutch mechanism for locking the loose pinion to the axle, of a shaft, connected bearings therefor adjustable toward and from the wheel-axle, a spring at either end of said bearings to hold the same in a normal position away from the wheel-axle, a loose winding-wheel and a driving-wheel on said shaft adapted to gear with the winding or driving pinion on the wheel-axle, a spring coiled on the shaft and connected with the winding and driving wheels, a ratchet-and-pawl mechanism to lock the winding-wheel against rotation in one direction, a fixed stop to lock the driving-wheel against rotation, and actuating mechanism to move either end of the connected shaft-bearings toward the wheel-axle, substantially as and for the purposes described.



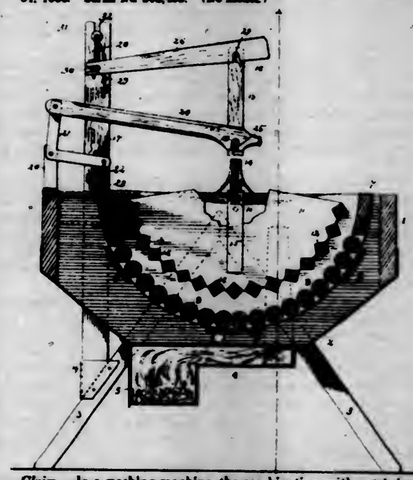
2. In a car brake and starter, the combination, with one of the wheel-axles, a fixed driving and a loose winding pinion on said axles, and a friction-clutch mechanism for locking the loose pinion to the axle, of a shaft, connected bearings therefor adjustable toward and from the wheel-axle, a spring at either end of said bearings to hold the same in a normal position away from the wheel-axle, a loose winding-wheel and a driving-wheel on said shaft adapted to gear with the winding or driving pinion on the wheel-axle, a spring coiled on the shaft and connected with the winding and driving wheels, a ratchet-and-pawl mechanism to lock the winding-wheel against rotation in one direction, a fixed resilient stop to lock the driving-wheel against rotation, and actuating mechanism to move either end of the connected shaft-bearings toward the wheel-axle, substantially as and for the purposes specified.

3. The combination, with the frame C, arranged to slide in bearings, and the springs T and T' at opposite ends of said frame, of the chains W and W', connected with the frame ends, and the lever Y, connected with said chains, whereby either end of the frame may be displaced against the stress of its spring and thereby automatically returned into its normal position, substantially as and for the purposes specified.

4. The combination, with the frame C, arranged to slide in bearings, the springs T and T' at opposite ends thereof, the pendent resilient stop Q, the shaft F, mounted in said frame, and the spring-actuated wheel P, provided with pins projecting from one face thereof engaging the stop Q, of the chains W W', connected with either end of the frame, and the lever Y, connected with both chains, substantially as and for the purposes specified.

5. The combination, with the wheel-axle, a fixed driving and a loose winding pinion on said axle, and the friction-clutch I K V U, of the sliding frame C, the shaft F, mounted therein, the power-spring S, a winding and driving wheel at opposite ends of said spring and connected therewith, said wheels being adapted to mesh with the winding and driving pinions, respectively, on the wheel-axle, the springs T and T', arranged at opposite ends of the frame C and connected therewith, the fixed stop Q, the ratchet and pawl M O, and the operating-chains W W', said parts being arranged for operation substantially as and for the purposes specified.

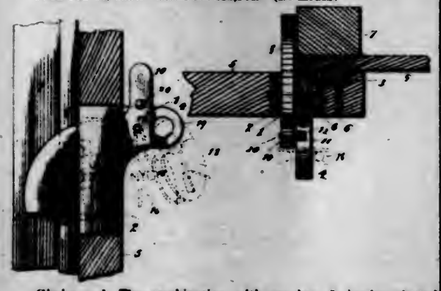
388,206. CULTIVATOR. JACOB W. KRAUS, Sterling, Ohio. Filed May 9, 1888. Serial No. 273,372. (No model.)



Claim.—1. As an improvement in cultivators, the lever having a spring inclosed in its upper end, the sleeve fitted on and inclosing said end of the lever and having coincident apertures, in combination with the rack-bar, substantially as shown and described.

2. In a cultivator, the combination, with the cultivator-frame, the short axles, the arms projecting forwardly therefrom, and the connecting-rods, of the curved arm G, having a looped end, and the plate or lug secured to said frame and around which said loop is passed, substantially as shown and described.

3. The combination, with the frame and the drag-bars, of the U-shaped hanger-bars b^3, the collars b^4, passed around connecting-bars of said drag-bars, the eyes or staples d, the curved lever D, the arm D', and the lever E, connected to said former lever, substantially as shown and described.



4. In a cultivator, the combination, with the frame and the rocking bar, of the rear hanger-bars having the bars provided with T-shaped ends, the spring encircling said bars, the sleeves having apertured cheeks, the U-shaped collars, and the cross-pins, substantially as shown and described.

388,207. WASHING-MACHINE. John W. Lanwell, Augusta, Kans., assignor to himself and Joseph Hadley, same place. Filed Jan. 31, 1888. Serial No. 262,462. (No model.)

Claim.—In a washing-machine, the combination, with vat 1, having post 20 and removable uprights 17, of removable reciprocating rubbers 7 and 11, the latter having uprights 15, with cross-bars 16, and the operating mechanism consisting of the bell-crank lever 21, link 22, detachable connecting-bar 24, with notch 25, engaging bar 16, crank-shaft 28, with handle 31, mounted in uprights 17, and detachable connecting-bar 26, with notch 27, engaging cross-bar 16 in uprights 15, substantially as described.

388,208. SEAL-LOCK. George W. Lewis, Portsmouth, Va., assignor to himself, Alexander P. Orne, and Leroy C. Goodwin, same place. Filed Oct. 17, 1887. Serial No. 252,871. (No model.)

Claim.—1. The combination, with car-door 5, having slotted casing 2, of eccentric locking-block 1, pivoted therein, lip 10, having hole 13, soft-metal pin 11, and arm 4, projecting from the side of the car adjacent to lip 10, substantially as described.

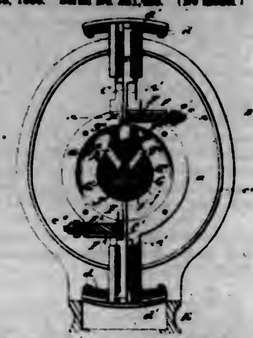
2. In seal-locks, as a new article of manufacture, a car-door fastening consisting of slotted metallic casing 2, having projection 4, and the locking-block 1, having lip 10, with perforation 13, and eccentrically pivoted in said casing, substantially as described.

3. The combination, with slotted casing 2, having projection 4, and locking-block 1, eccentrically pivoted in said casing, having lip 10, with perforation 13, of a fragile seal, substantially as set forth.

388,209. STATION-INDICATOR. George C. Logan, New Orleans, La. Filed May 31, 1888. Serial No. 275,045. (No model.)

Claim.—1. In a station-indicator, the combination, with a drum and an endless indicating-belt carried by said drum, of an air-cylinder below the drum, a piston reciprocating in said cylinder, a trip-rod connected to the piston, a pawl on the trip-rod for engaging the drum to rotate the same, and a latch on the said trip-rod and engaging the drum to lock it in position, substantially as described.

2. In a station-indicator, the combination, with a drum provided with pins projecting from its ends, and an indicating endless belt carried by said drum, of an air-cylinder below the drum, a piston in the said cylinder, a trip-rod secured to the piston and projecting past the drum, a spring-pressed pawl carried by the trip-rod and engaging the pins of the drum to rotate the same by the movement of the said rod, and a latch carried by the trip-rod and engaging the pins on the drum for holding it in the position to which it has been moved, substantially as herein shown and described.



3. In a station-indicator, the combination of a polygonal drum provided with lugs projecting from the angles of the drum, an indicating-belt consisting of flat boards united a short distance apart by links to receive the lugs on the drum between them, and means for rotating said drum, substantially as herein shown and described.

4. In a station-indicator, the combination, with a polygonal drum provided with pins projecting from its ends and with lugs projecting from the angles of the drum, and an endless belt carried by the drum and consisting of spaced slats united by links, of an air-cylinder below the drum, a valved piston in the said cylinder, a trip-rod secured to the piston and projecting past the drum, a spring-actuated pawl mounted on the trip-rod and engaging the pins on the end of the drum, and a pivoted latch on the trip-rod above the said pawl and engaging the said pins to hold the cylinder in the position into which it has been moved, substantially as herein shown and described.

5. In a station-indicator, the combination, with a drum and an endless indicating-belt carried by the said drum, of an open-top cylinder below the drum, a centrally-apertured piston provided with a tubular piston-rod and with ports leading from the central aperture, a valve in the said piston and provided with a rod extending into the tubular piston-rod and adapted to be engaged by a projection carried by the frame, and means for operating the drum from the said piston, substantially as herein shown and described.

6. In a station-indicator, the combination, with a casing, a drum journaled in the upper part of the casing, and an endless indicating-belt carried by the drum, of an open-top air-cylinder in the lower part of the casing, a centrally-apertured piston provided with a tubular rod and with ports leading from the central aperture, a spring surrounding the tubular rod between a collar on the piston and a guide for the piston-rod, a valve in the piston provided with a rod projecting through the tubular rod, a fixed projection in the casing against which the upper end of the said valve-rod abuts, and means for operating the drum from the piston, substantially as herein shown and described.

388,210. ROTARY ENGINE. John Marvin, Northport, N. Y. Filed Dec. 12, 1886. Serial No. 221,423. (No model.)

Claim.—1. The combination, with the cylinder of a rotary engine, of an eccentric surrounding the same, radial vanes working in the cylinder and connected to the horizontal flange e^2 of the eccentric by the anti-friction wheels e^3, carried by the vanes, one upon the outer and the other upon the inner surface of said flange, substantially as shown and described.

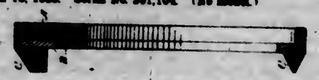
2. The plate A B of the cylinder placed upon a fixed hollow shaft and provided with radial vanes C, connected to the surrounding eccentric D, and formed with tangential boxes F', adjacent to the vanes, in combination with the packing following F', fitted in the boxes, substantially as described.

3. The shaft G, formed with steam-passages and with the projections f between the steam-ports, in combination with the packing J, rings j K K', and the cylinder placed thereon, and the vanes C C, and eccentric D for operating the vanes, substantially as described.

4. The cylinder placed upon the fixed shaft G and provided with radial vanes, in combination with the eccentric D, and the yoke L', for connecting the shaft M to the cylinder, substantially as described.

388,211. BARBER'S CHAIR. Fred Mergenthaler, Chicago, Ill., as signor to himself and Hugo Heintzler, same place. Filed Feb. 5, 1887. Serial No. 226,694. (No model.)

Claim.—In a tilting-chair, the combination, with the pivoted rod F, arm H, connected therewith, and rod I, connecting said arm with the chair-seat, of the arm E, rigidly connected at one end with the rod F, treadle B, pivoted to the other end of said arm, rack a, for engaging the lower end of said treadle, and a stop to limit its motion relative to the arm E, substantially as described.

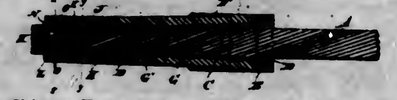


388,212. BUTTON. Frederik Meyers, Brooklyn, N. Y., assignor to himself and John H. Pratt, Jr., same place. Filed Jan. 17, 1888. Serial No. 261,060. (No model.)

Claim.—1. In a self-fastening button, the combination, with a face-plate, of a back-plate formed with a centrally-apertured neck or projection, a spring whose bow is interposed between the plates, said spring having an eye projecting downwardly into the neck or projection of the back-plate and registering with the back-plate opening, and a stud or shank for engagement with said eye, substantially as described.

2. In a self-fastening button, the combination, with a face-plate, of a black-plate connected thereto and formed with a centrally-apertured neck or projection, 13, a spring, 14, formed from a wire bent to form a circular section, 3, and then inward, as at 4, downward, as at 5, outward and again inward, as at 6, upward, as at 7, and outward, as at 8, and a shank formed with a pointed head, and an annular groove, 16, which is arranged to receive the sections 6 of the spring 14, substantially as described.

388,213. HORSESHOE. Charles Miller, New York, N. Y. Filed Jan. 16, 1888. Serial No. 261,104. (No model.)



Claim.—1. A blank for horseshoes, consisting of a steel strip bent into proper form with a thin strip of wrought-iron welded to its under side, substantially as described.

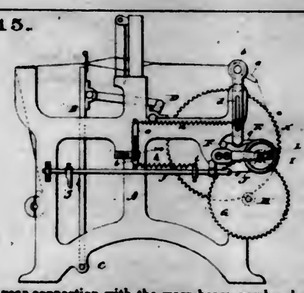
2. A horseshoe having its body portion formed from steel with a thin strip of wrought-iron welded to its under side, and having calks welded to the under side of said strip, substantially as described.

3. A horseshoe having its body portion formed from steel with a thin strip of wrought-iron welded to its under side, and having steel calks welded to the under side of said strip, substantially as described.

388,214. AXLE-SPINDLE AND BEARING. Charles V. Mosher, Fairmount, Ind. Filed Sept. 20, 1887. Serial No. 250,188. (No model.)

Claim.—1. The conical spindle provided with the reduced portion D, of the sleeve H, locked to the reduced end of the spindle, to turn therewith, and provided with an enlarged and apertured end, L, the nut K, screwed on the end of the reduced portion of the spindle, and provided with recess N, and the pins O in the recess N and apertures of the end L of the sleeve H, substantially as herein shown and described.

2. In a vehicle-spindle and bearing, the combination, with the bearing F, having the outwardly-flaring openings G G', of the spindle C, having the reduced portion D, screw-threaded at its outer end and provided with the groove I, the sleeve H, having the enlarged end L and provided with the pin J, the nut K, having the annular recess N, and the pins O, substantially as herein shown and described.

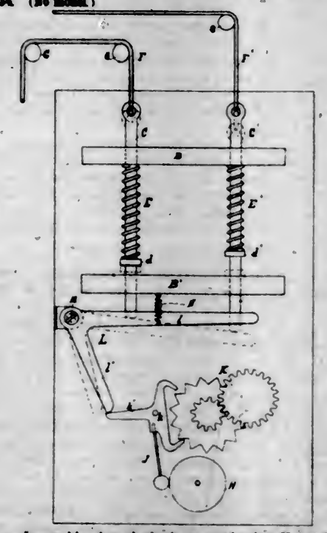


388,215. LET-OFF MECHANISM FOR LOOMS. James Mosher, Goldstick, R. I. Filed Mar. 3, 1888. Serial No. 266,576. (No model.)

Brief.—As the tension on the warp varies the sliding bar is correspondingly set, so that the lay in its forward movement will carry the bar through different distances. As the bar is thus driven forward by the lay the tension-bar is correspondingly pressed against the warps, which immediately react as soon as the strain is removed and press the tension-bar back to its former position, and thus, by means of the attached cord, turning a pulley which can move in but one direction, and through suitable gearing turning the warp-beam as well.

Claim.—1. In a loom, the combination of the warp-beam and lay, the wheel I, in gear-connection with the warp-beam, a pawl and ratchet to prevent the rotation of the said wheel I in one direction, but leave it free to rotate in the opposite direction, the tension-bar a, its lever d, extending from said tension-bar, a frictional band, e, having one end in connection with said lever and extending around said wheel I in frictional contact therewith, the spring A, and an extension from said band to a point forward of the lay, the said extension constructed to engage the lay in the forward or beating movement of the lay, substantially as described.

2. In a loom, the combination of the warp-beam and lay, the

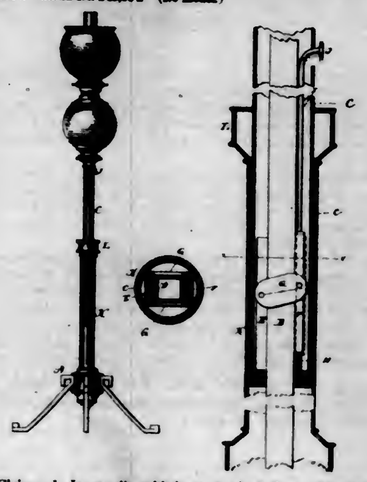


388,215.

wheel I, in gear-connection with the warp-beam, pawl and ratchet to prevent the rotation of the wheel I in one direction, but leave it free to rotate in the opposite direction, the tension-bar *a*, over which the warps pass, lever *d*, extending from the said tension-bar, a frictional band, *e*, having one end in connection with said lever and extending around said wheel I in frictional contact therewith, an extension from said band to a point forward of the lay, the said extension constructed to engage the lay in the forward or beating movement of the lay, the two-armed lever *o l*, having the arms thereof of different lengths, differential springs *h n*, each hung by one end to the respective arms *o l* of the said lever, the other end of the spring *h* engaged with the said band, the other end of the said spring *n* hung to the lever *d* between the tension-bar and the point where the said band is attached to said lever *o l*, substantially as described.

3. In a loom, the combination of warp-beam and lay, the wheel I, in gear-connection with the warp-beam, said wheel provided with a pawl and ratchet to prevent the rotation of the said wheel I in one direction, but leave it free to rotate in the opposite direction, the tension-bar *a*, its lever *d*, extending from said tension-bar, a frictional band, *e*, having one end in connection with said lever and extending around said wheel I in frictional contact therewith, and an extension from said band to a point forward of the lay, the said extension constructed to engage the lay in the forward or beating movement of the lay, the said pawl hung on a stationary pivot, with a cam-shaped spring, *i*, and a pin, *f*, projecting from said pawl and adapted to work over said cam-shaped spring, substantially as described.

388,216. COMBINED FIRE AND BURGLAR ALARM. WILLIAM B. MURRAY, Minneapolis, Minn., assignor to Nathan Underwood, Jr., and Edward D. MacDonald, same place. Filed Nov. 10, 1887. Serial No. 254,734. (No model.)



Claim.—In combination, clock-alarm mechanism K *k k'* J H, tension device B B' C E *d*, bell-crank lever L, fulcrumed at M and having its arm *l* in the path of the movable part C of said tension device, and having its other arm in engagement with the lever-arm *k'* of the clock-escapement *k* when in its normal position, a retraction-spring, N, for returning said lever to its normal position, and the tight combustible cord F, attached at one end to the movable part C of said tension device, extending directly or indirectly to the parts of a room or building likely to take fire or to be disturbed by burglars, as and for the purpose set forth.

388,217. MANUFACTURE OF SODIUM-CHLORATE. RUDOLF K. MURRAY, Seaforth Hall, near Liverpool, County of Lancaster, and GEORGE RUDDLESDIN, Northwich, County of Chester, England. Filed Apr. 17, 1888. Serial No. 270,982. (No specimens.) Patented in England Oct. 31, 1888, No. 5,139; in Germany Nov. 6, 1888, No. 47,739; in Belgium Nov. 12, 1888, No. 82,180; in France Nov. 12, 1888, No. 194,886, and in Austria-Hungary Jan. 6, 1894, No. 43,033 and No. 57,978.

Claim.—1. The process of manufacturing chlorate of soda by treating magnesia mixed with water with chlorine, and subsequently effecting the decomposition of the resulting magnesian liquor by means of caustic soda or carbonate of soda, or mixtures of the same, substantially as described.

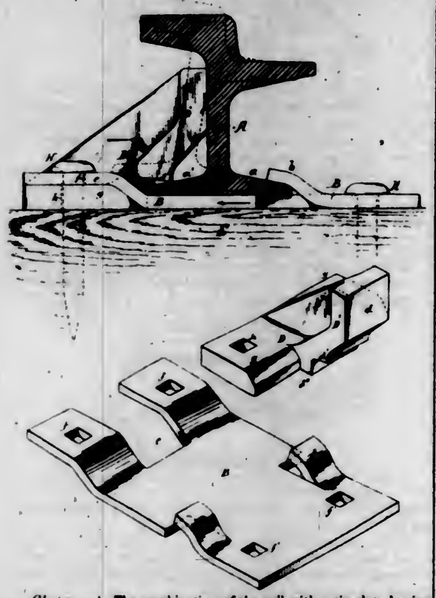
2. The process of manufacturing chlorate of soda by treating magnesia mixed with water with chlorine, then boiling down the resulting magnesian liquor to crystalline cut magnesium-chloride, and then decomposing the liquor by means of caustic soda or carbonate of soda, or mixtures of the same, substantially as described.

388,218. LAMP-STANDARD. WILLIAM PATNER, Meriden, Conn., assignor to the Meriden Brass Company, same place. Filed July 11, 1887. Serial No. 243,894. (No model.)

Claim.—1. In an adjustable lamp-standard, the combination of a stationary upright, B, a tube, C, surrounding said upright, and carrying the lamp, and having a collar, D, at its inner end, the said surrounding tube movable longitudinally on said upright, a shoe, E, fixed to said collar and so as to bear upon one side of said upright, a shoe, F, upon the opposite side of said upright, but free for limited vertical movement, diagonal links G, connecting the fixed shoe E on one side of the upright with the movable shoe F on the opposite side of said upright, and a spring supported by said collar and arranged to bear yieldingly in a vertical direction upon said movable shoe F, substantially as described.

2. In an adjustable lamp-standard, the combination of a stationary upright, B, a tube, C, surrounding said upright and carrying the lamp and having the collar D on its inner end, the said surrounding tube movable longitudinally on said upright, a shoe, E, fixed to said collar and so as to bear upon one side of said upright, a shoe, F, upon the opposite side of said upright, but free for limited vertical movement, diagonal links G, connecting the fixed shoe E on one side of the upright with the movable shoe F on the opposite side of said upright, and a spring supported by said collar and arranged to bear yieldingly in a vertical direction upon said movable shoe F, with a jacket fixed to the base and surrounding the lower part of said tube with a connection from said movable shoe F to a point in the said tube above the said jacket, substantially as described.

388,219. WELL. HENRY PERKINS, New York, N. Y. Filed Apr. 19, 1888. Serial No. 271,189. (No model.)

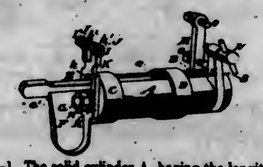


Claim.—1. A cylindrical well-curb support, 1, having perforations 7, cutting-tooth 5, flange 2, with angle-iron annular support 3, and brace-rods 4, substantially as described.

388,219.

2. A well constructed with the cylindrical curb-support 1, having perforations 7 and cutting-tooth 5, and flange 2, with angle-iron annular support 3, and brace-rods 4, and the masonry curbing 6, resting on flange 2, substantially as shown and described.

388,220. RAIL-FASTENING. JAMES GOBIN, Jr., Philadelphia, Pa., assignor to William Wharton, Jr., and Company, Incorporated, same place. Filed May 4, 1888. Serial No. 272,764. (No model.)

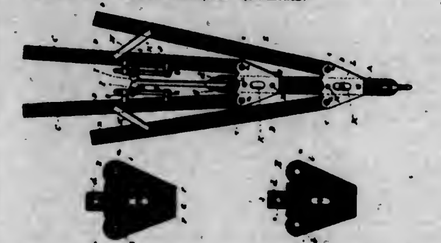


Claim.—1. The combination of the rail with a tie-plate having lips which overlap one of the base-flanges of the rail, and with a brace-piece adapted to bear against the opposite side of the rail and transversely detachable from the tie-plate, substantially as described.

2. The combination of a rail with a tie-plate having lips overlapping one of the base-flanges of the rail with a brace-piece adapted to bear against the opposite side of the rail and having side wings provided with spike-holes, and tongues on the tie-plate overlapping the said side wings of the brace-piece, and also provided with spike-holes, so that when the spikes are driven through these holes the tie-plate and brace will be secured to the rail and to each other, substantially as set forth.

3. The combination of a rail and a tie-plate having lips at one side adapted to overlap one of the base-flanges of the rail, with a brace-piece adapted to bear against the opposite side of the rail and having side wings with spike-holes therein, and tongues on the tie-plate overlapping the side wings of the brace-piece and provided with spike-holes, the spike-holes of the tongues overlapping the spike-holes of the brace-piece, whereby the spike or bolt acts as a wedge to draw the tie-plate and brace-piece together, substantially as described.

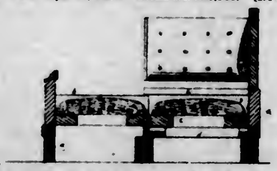
4. A struck-up metallic tie-plate having portions cut out and struck up to form lips *b b*, with a cut-out portion, *c*, to form tongues, said tongues being struck up into the position and for the purpose described.



388,221. SAW-SWAGE. REMELAIN B. REMER and OMAR A. ADAMS, Lakeview, Mich. Filed Jan. 6, 1888. Serial No. 259,892. (No model.)

Claim.—1. The solid cylinder A, having the longitudinal groove *c*, the anvil F, arranged on the bottom of said groove, the bands C D, and the end-beveled die E, in combination with suitable mechanism for holding the saw-blade, as and for the purpose set forth.

2. In a saw-tooth swage, the combination of a cylinder, A, with fixed uprights at one end, adjustable upright at the other, and clamp screws and nuts to hold the saw-blade adjustably, as described.



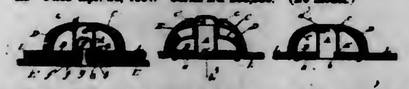
388,222. HARROW. MARION M. REMER, Gossett, Ill. Filed Mar. 20, 1888. Serial No. 267,944. (No model.)

Claim.—1. In a harrow, the combination, with the central beam, the front and rear pairs of wing-beams, and the braces I, of the coupling-plates having the parallel longitudinal ribs providing the bearing portion and having the lateral wings, and the plate having the parallel ribs, the lateral wings, and the rear lug, *d*, provided with the upwardly-projecting cylinder-stud *e*, the said plates placed in pairs above and below the beam, substantially as specified.

2. In a harrow, the combination, with the central beam and the wing-beams, of the coupling-plates, the links shorter than the distance between pivotal points of the front and rear wing-beams, the bearing-rods secured in the brackets Z, and the adjustable braces having the eyebolts S, the nuts *h*, and the washers having the elongated opening, substantially as specified.

388,223. EXTENSION-LOUNGE. BERNHARD REMPEL, Brooklyn, N. Y. Filed Apr. 17, 1888. Serial No. 270,919. (No model.)

Claim.—The combination, in a sofa-frame, of a drawer sliding back and forth in said frame, ledges *c c* at each end of said sofa-frame, and a detached seat-frame normally suspended on said ledges and adapted to be lowered to the space occupied by the drawer when the latter is drawn out to form the bed, substantially as described.

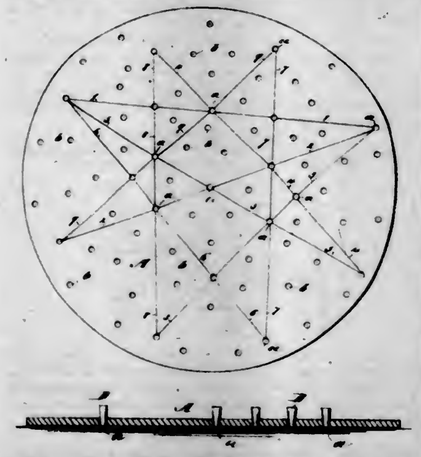


388,224. PRINTER'S GALLEY. FREDERICK SMILEY, Brooklyn, N. Y. Filed Nov. 10, 1887. Serial No. 254,751. (No model.)

Claim.—As an improved article of manufacture, a printer's galley consisting of the angular side and end pieces, B B', having the vertical longitudinal rib A on the horizontal member *b'* of the said side and end pieces, and the bottom A, having its edges bent upward over and upon the said rib, as set forth.

388,224.

388,225. SEPARABLE BUTTON. MADISON D. SHIPMAN, De Kalb, Ill. Filed Apr. 20, 1887. Serial No. 235,530. (No model.)

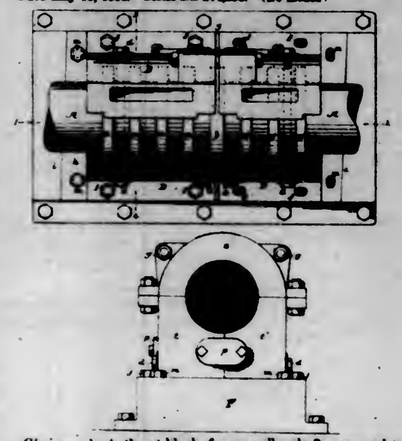


Claim.—1. In a button-head of a separable button, the combination, with the shell, which is secured to the lower or under side of the material and contains within it a stud-receiving tube and a spring-catch which works in an opening made in a side wall of said tube for engagement with a coacting stud, of a second shell clamping on the upper side of the material and secured to the shell below the material by clinching, and the outer or inclosing shell, E, secured by clinching to said second or upper shell, substantially as and for the purposes set forth.

2. In a separable button, a button-head comprising the stud-holding tube A, provided with notch *a'* in its side and a spring-catch having its catching portion in said notch, the shell C, secured to the base-flange of said tube and adapted to be applied to the lower side of the material, and the shell D, applied on the upper side of the material, the said shells being secured together with the material between by clinching, substantially as and for the purposes set forth.

3. In the button-head of a separable button, the combination, with a stud-receiving tube having an annular base-flange and a notch or opening in its side wall neighboring its base-flange, and the spring-catch, which has its body portion exterior to said stud-receiving tube and its catching portion seated in the notch of said tube, of the shell C, which has its lower edge secured to the base-flange of said tube and its wall inclosing both the said tube and spring-catch, and also clamping on the under side of the fabric, and the coacting shell D, clamped on the upper side of the material and secured by its upper end with the upper end of the lower side shell, C, substantially as and for the purposes set forth.

388,226. PUZZLE. LOUIS E. SIMPSON, New York, N. Y. Filed Nov. 12, 1887. Serial No. 254,946. (No model.)



Claim.—1. A puzzle consisting of a board provided with a series of pin-apertures arranged in intersecting lines and baffle-apertures promiscuously arranged upon the board contiguous to said lines of pin-apertures, substantially as shown and described.

2. A puzzle consisting of a board provided with series of five pin-apertures arranged in nine intersecting lines and baffle-apertures promiscuously arranged upon the board contiguous to said lines of pin-apertures, substantially as shown and described.

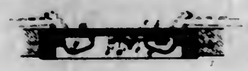
3. In a puzzle, the combination, with a board provided with series of five pin-apertures arranged in nine intersecting lines and baffle-apertures promiscuously arranged upon the board contiguous to said lines of pin-apertures, substantially as shown and described, of a series of nineteen pegs adapted for insertion in the pin-apertures, substantially in the manner and for the purpose herein set forth.

388,227. THRUST-BLOCK. SIMMONS H. SMITH, Philadelphia, Pa. Filed May 18, 1888. Serial No. 274,253. (No model.)

Claim.—1. A thrust-block for propeller-shafts, recessed to receive the collars or flanges of the shaft, and having that portion below the horizontal center of the shaft made in parts divided longitudinally in a vertical plane, so that they can be removed transversely without disturbing the shaft, all substantially as specified.

2. A thrust-block for propeller-shafts, grooved for the reception of the collars or flanges of the shaft, and made in parts divided longitudinally in a vertical plane, so that each part can be removed transversely without disturbing the shaft, all substantially as specified.

388,228. ANTI-FRICTION BEARING. THOMAS H. SUMNER, Philadelphia, Pa., assignor, by direct and mesne assignments, to John F. Vom same place, and John W. Barry, Bridgeville, Pa. Filed Jan. 12, 1888. Serial No. 260,501. (No model.)



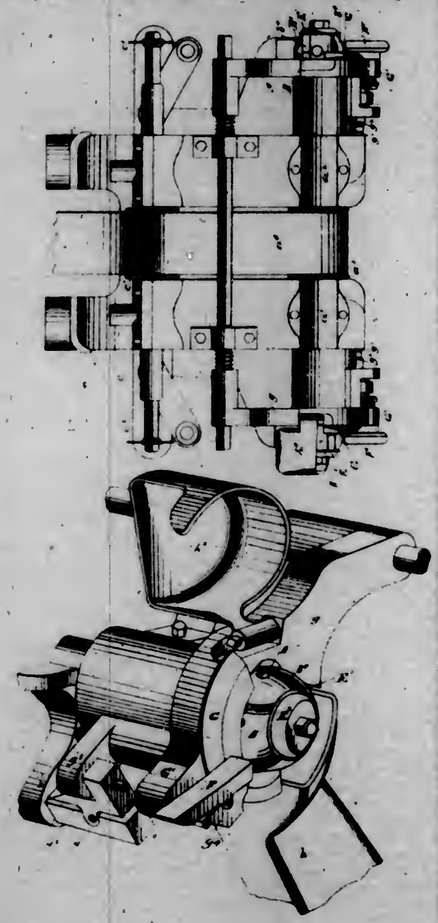
Claim.—1. The combination of a shaft or journal and its box, rollers forming the bearings for said shaft or journal, and bearing-blocks on which said rollers are free to swing, all substantially as specified.

2. The combination of the shaft or journal and its box, the anti friction rollers, bearing-blocks on which said rollers are free to swing, and opposite bearings between which the rollers are confined longitudinally, all substantially as specified.

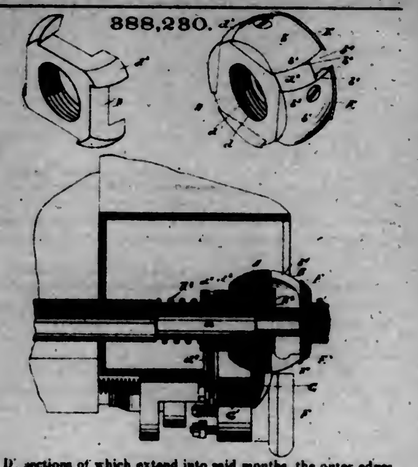
3. The combination of the shaft or journal and its box, the anti-friction rollers, and rounded bearing-blocks located midway of said rollers and adapted to recesses in the top of the box, all substantially as specified.

388,229. BOLT. CARL W. F. THOST, Hamburg, Germany. Filed Mar. 30, 1888. Serial No. 268,942. (No model.)

Claim.—1. The combination, with the two leaves of a folding door, of the retractible bolts for holding the leaves closed, the weighted lever *c*, for drawing back said bolts, springs for automatically opening the door-leaves, a spring-click secured to one of the said bolts, and the locking-roller operated from a central station, substantially as and for the purpose set forth.



388,229.



2. The combination, with the two leaves of a folding door, of the retractible bolts for holding the leaves closed, the weighted lever *c*, for drawing back said bolts, pivoted to one of the door-leaves and provided with an extension engaging with a catch on the other door-leaf, springs for opening the door-leaves, a spring-click secured to the upper fastening-bolt, the locking-roller engaging with said spring-click, and a disengaging-catch for releasing the said roller and spring-click, substantially as and for the purpose set forth.

388,230. HEEL-TRIMMING MACHINE. CHARLES H. TRASK, Lynn, Mass. Filed Dec. 6, 1887. Serial No. 256,903. (No model.)

Claim.—1. In a heel-trimming machine, the combination of a rotary cutter having the cross-mouths *b'*, with a top-lift edge-rest

388,230.

block, *D'*, sections of which extend into said mouths, the outer edges of which sections are flush or substantially flush with the cutting-edges of the cutters and form the top-lift edge-rest D, as and for the purposes described.

2. In a heel-trimming machine, the combination of a rotary cutter having the mouths or cross-recesses *b'* in front of the cutting-edges thereof with the top-lift edge-rest block *D'*, having sections extending into said mouths, and the outer surfaces of which are substantially flush with the portions of the cutting-edges of the cutter with which they are in line and form a top-lift edge-rest, D, which block *D'* is adjustable lengthwise the cutter to vary the length of the cutting-sections thereof, as and for the purposes described.

3. The combination, in a heel-trimming machine, of a rotary cutter having the cross recesses or mouths *b'*, the rand cutter or cutters E, integral with the blades of the cutters, and the rotary top-lift edge rest block *D'*, having sections which extend into said mouths or recesses to shield or mask sections of the cutting-edges of the cutting-blades, the outer surfaces of which form a top-lift edge-rest, D, substantially as described.

4. The combination, in a shoe-trimming machine, of a rotary duplex cutter having blades or knives of a length to provide two cutting edges or sections, whereby it is adapted to be used with one section as a right trimmer and with the other section as a left trimmer, and having cross recesses or mouths *b'* in front of the cutting edges or blades of the knives, with the rotary top-lift-edge-rest block *D'*, having sections extending into said mouths or recesses to mask or shield the unused section of the blades or knives, the outer surfaces of which section form the top-lift edge-rest D, as and for the purposes described.

5. In a trimming-machine for boots and shoes, the combination of a block, B^3, having dovetail tongues B^3, and the dovetail recess *b* at the forward end of each tongue, with the blades *B'*, having dovetail recesses to fit the dovetail tongue, and undercut recesses to receive the undercut ends *b* of the tongues B^3, as and for the purposes described.

6. The combination, in a trimming-machine for boots and shoes, of the rotary cutter having the cross recesses or mouths *b'*, the edge-rest block *D'*, having sections to mask or shield portions of the cutting-edges of the knives or blades of the cutter, and an abutment or rest connected with the said top-lift edge-rest and located in a position to be moved by the work which is presented to the action of the cutter, whereby the position of the edge-rest is automatically varied during the rotation of the trimmer, substantially as described.

7. The combination, in a boot and shoe trimming machine, of a rotary trimmer having cross recesses or mouths *b'*, and the top-lift edge-rest D, connected with the said trimmer and having sections which act to mask or shield portions of the cutting edges or blades of the knives or trimmers, with the heel-tread rest G, substantially as described.

8. The combination, in a boot and shoe trimming machine, of a rotary trimmer having cross recesses or mouths *b'*, and the top-lift edge-rest block *D'*, connected with said trimmer and having sections which act to mask or shield portions of the cutting edges or blades of the knives or trimmers, with the heel-side rest F, substantially as described.

9. The combination, in a boot and shoe trimming machine, of a rotary trimmer having cross recesses or mouths *b'*, and the top-lift edge-rest block *D'*, connected with the said trimmer and having sections

which act to mask or shield portions of the cutting edges or blades of the knives or trimmers, with the rand-guide E, substantially as described.

10. The combination, in a boot and shoe trimming machine, of a rotary trimmer having cross recesses or mouths b^4, and the top-lift edge-rest block D', connected with the said trimmer and having sections which act to mask or shield portions of the cutting edges or blades of the knives or trimmers, with the tread-rest G and the rand-guide E, substantially as described.

11. The combination, in a boot and shoe trimming machine, of a rotary trimmer having cross recesses or mouth b^4, and the top-lift edge-rest block D', connected with the said trimmer and having sections which act to mask or shield portions of the cutting edges or blades of the knives or trimmers, with the tread-rest G and the heel-side rest F, substantially as described.

12. The combination, in a boot and shoe trimming machine, of a rotary trimmer having cross recesses or mouths b^4, and the top-lift edge-rest block D', connected with the said trimmer and having sections which act to mask or shield portions of the cutting edges or blades of the knives or trimmers, with the heel-side rest F and the heel-rand guide E', substantially as described.

13. The combination, in a boot and shoe trimming machine, of a rotary trimmer having cross recesses or mouths b^4, and the top-lift edge-rest block D', connected with the said trimmer and having sections which act to mask or shield portions of the cutting edges or blades of the knives or trimmers, with the tread-rest G, the heel-side rest F, and the rand-guide E', substantially as described.

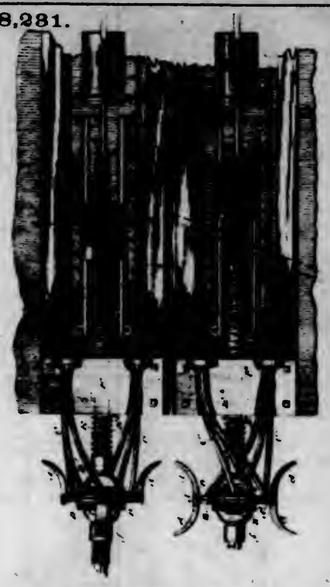
14. The combination, in a boot and shoe trimming machine, of the rotary cutter having blades or knives the cutting-edges of which are longer than the length of the cut which it is desired to make or of the work which it is desired to trim, having mouths or sections b^4, and the laterally-movable top-lift edge-rest block D', sections of which shield or mask portions of the cutting-edges of the knives or blades of the cutter, with the tread-rest G, movable lengthwise the axis of the cutter, substantially as described.

15. The combination, in a boot and shoe trimming machine, of the rotary cutter having blades or knives the cutting-edges of which are longer than the length of the cut which it is desired to make or of the work which it is desired to trim, having mouths or sections b^4, and the laterally-movable top-lift edge-rest block D', sections of which mask or shield portions of the cutting-edges of the knives or blades of the cutter, with the heel-side rest F, movable lengthwise the axis of the cutter, substantially as described.

16. The combination, in a boot and shoe trimming machine, of the rotary cutter having blades or knives the cutting-edges of which are longer than the length of the cut which it is desired to make or of the work which it is desired to trim, having mouths or sections b^4, and the laterally-movable top-lift edge-rest block D', sections of which mask or shield portions of the cutting-edges of the knives or blades of the cutter, with the tread-rest G and heel-rest F, movable lengthwise the axis of the cutter, substantially as described.

17. The combination, in a heel-trimming machine, of the rotary cutter having cross recesses or mouths b^4, the rest-block D', adapted to rotate with the cutter and having sections which mask or shield portions of the cutting-edges of the knives or blades thereof, and the arm g, moving lengthwise the axis of the cutter in opposition to spring-pressure and connected with the rest D, substantially as described.

18. The combination, in a heel-trimming machine, of the rotary cutter having cross recesses or mouths b^4, the rest-block D', adapted to rotate with the cutter and having sections which mask or shield portions of the cutting-edges of the knives or blades thereof, the arm g, movable lengthwise the axis of the cutter in opposition to spring-pressure and connected with the rest D, and the tread-rest G and heel-side rest F, carried by said arm, substantially as described.



19. The combination of the rotary trimmer having the blades b' and rand-cutters E, integral with said blades, with the rand-guide E and the counter-guide E^3, substantially as described.

20. The combination of the rotary trimmer, the exhaust-passage H, formed by the casting A, which is cut away at A^2, as described, the arm g, movable lengthwise the axis of the cutter, and the hinged hood h^4, attached to said arm to be movable therewith and to swing upon a vertical arc in relation thereto, as and for the purposes described.

21. The combination, in a duplex trimming-machine, of the cutters B B', the exhaust-passages H, arranged in relation to said cutters, as specified, and connected with a common chamber containing an air-exhausting fan or device, said chamber and exhaust device, and the hoods h^4, substantially as described.

22. The combination, in a trimming-machine, of a rotary trimmer having cross recesses or mouths b^4, the rest D, having the hub d^3, and groove d^4, with the movable block G' and the connecting plate or piece d^7, substantially as described.

388,231. CAR-COUPLING. JOHN P. TURNEY, Arlington, Oreg. Filed Dec. 8, 1887. Serial No. 257,262. (No model.)

Claim.—1. The combination, with the cars of a train, of pneumatic couplings for connecting the cars, and a series of pneumatic tubes corresponding to the couplings and extending to the cab of the engineer, a reservoir for compressed air, and a switch conduit or valve mechanism for directing the air-blast through any of said tubes to any one of the couplings, substantially as shown and described.

2. The combination, with a series of tubes extending throughout the train, of a face-plate, A, in the cap having openings through the same connecting with the said tubes, a reservoir for compressed air, a tube, c, leading from the reservoir to the center of the face-plate, and a swinging hollow arm or conduit, B, having a channel-way, b, adapted to connect the tube c with any one of the tubes C, substantially as and for the purpose described.

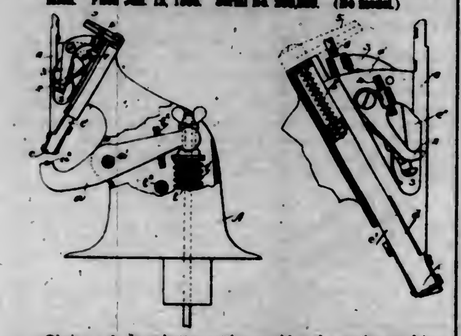
3. The pneumatic car-coupling consisting of hooked and slotted draw-bar E, the coupling-head consisting of face-plate D, with hook-shaped guide-arms d, the socket-ring D', sleeve E', with bulbous end and bolt E^2, and spiral spring E^3, substantially as and for the purpose described.

4. A car-coupling consisting of a rotary adjustable hook-shaped draw-bar, E, and a spring-seated coupling-head surrounding and loosely connected to the same, substantially as and for the purpose described.

5. A car-coupling having face-plates combined with pneumatic tubes opening through said face-plates, the said openings being adapted, as described, to register with those of the next car and form continuous channels when the cars are coupled, substantially as and for the purpose described.

6. The combination of a rotary adjustable draw-bar, E, having pin or lug i, the sleeve G, with cam-groove g and slides h, the guides H H, spiral spring I, the piston-rod J, connected to the sleeve G, and the piston and cylinder K, and suitable pipes for transmitting a pneumatic pressure to the said cylinder, substantially as and for the purpose described.

7. The combination, with the pneumatic car-couplings and the series of continuous tubes connecting with the same, of a register or commutator for throwing any one tube into communication with any other tube, substantially as and for the purpose described.

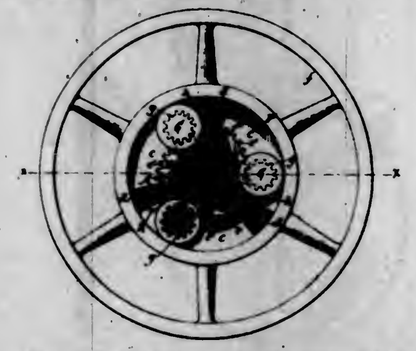


8. The combination, with the continuous tubes, of the register or commutator consisting of stationary section I, with passage-ways l and m m' through it, the two rotary adjustable heads L' L^2, with corresponding passage-ways and bevel-wheels, and the adjustable shaft M, with bevel-wheel M', adapted to be thrown alternately into engagement with the bevel-wheels of the two heads, substantially as and for the purpose described.

9. The combination of the middle section, I, of the register having through-channels l and terminal channels m m', the adjustable heads L' L^2, tubes N N', connecting with the terminal channels m m', and the two cylinders K K', connecting with the tubes N N', substantially as and for the purpose described.

10. The combination of the register L L' L^2 and the communicating tubes, the shaft M, with notched disk M^2, lever and rods O O', detent O^2, sliding block n, and curved guide p, substantially as and for the purpose described.

11. The combination, with a series of longitudinal tubes and a register or commutator consisting of stationary section I, with passage-ways and movable heads L' L^2, connected to the longitudinal tubes, of an adjusting mechanism for rotating said heads, having an indicator-disk notched to represent the openings in the heads, and locking mechanism for said disk, substantially as and for the purpose described.

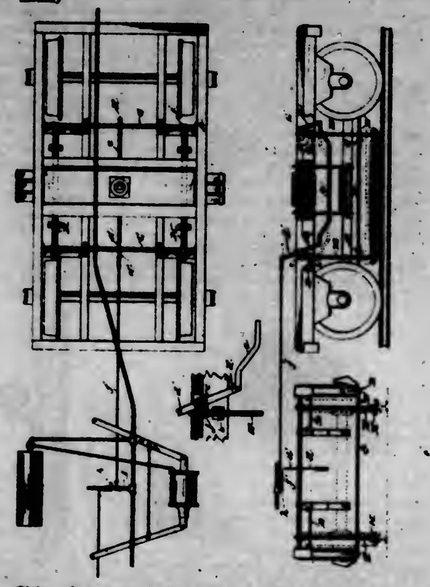


388,232. BUTTON-SETTING MACHINE. JOHN H. VEITCH, Boston, Mass., assignor to the Peninsular Novelty Company, Grand Rapids, Mich. Filed Jan. 12, 1888. Serial No. 260,859. (No model.)

Claim.—1. In a button-setting machine, the stationary driver, movable anvil, yielding carrier, and raceway movable simultaneously with the carrier, combined with two feed-dogs, 2 3, adapted to act alternately upon the fastenings in the raceway at the rear side thereof, the adjusting-screws 4 and 6 for the feed-dogs, and the studs or projections 5 7, substantially as described.

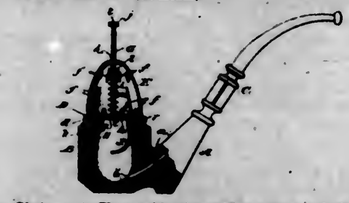
2. In a button-setting machine, the stationary driver, yielding carrier, and raceway, and alternately movable feed-dogs 2 3, combined with the movable jaw carrying the anvil, the treadle-rod t, the adjusting-screw t^3, and the stud t^4, substantially as described.

388,233. CLUTCH. CHRISTIAN WIEBOLD, Buffalo, N. Y. Filed Apr. 30, 1888. Serial No. 272,202. (No model.)



Claim.—1. The combination, with the hub A, provided with cam-shaped ribs e, having teeth e', of a ring, F, surrounding the hub, and friction-rollers G, arranged between the hub and ring and provided with teeth g, meshing with the teeth of said cam-ribs, substantially as set forth.

2. The combination, with the hub A, provided on its face with recesses c, separated by projections d, said cam-shaped ribs e, formed on the hub in the recesses c, and having gear-teeth e', of a ring, F, surrounding the hub, and friction-rollers G, arranged in the recesses c, and provided with a contracted portion having gear-teeth g, which engage with the teeth of the cam-ribs e, substantially as set forth.



3. The combination, with the hub A, provided with cam-shaped ribs e, having gear-teeth e', of a ring, F, surrounding the hub, friction-rollers G, arranged between the hub and ring and provided with gear-teeth g, and springs A, secured to the hub and bearing against the friction-rollers, substantially as set forth.

388,234. CAR-BRAKE. HAM. A. WHITNEY and HOWARD B. BENTON, Minneapolis, Minn. Filed June 16, 1887. Serial No. 240,893. (No model.)

Claim.—In a car-truck, the combination of the frame, rock-shafts journaled thereto and having intermediate arms projecting transversely therefrom and trip-arms projecting from near the ends thereof, posts suspended from the frame in suitable guides, carrying buffer wheels or beams on their lower ends and provided with suitable nuts on their upper ends for engagement with said trip-arms, straps connecting the several rock-shafts together, and another strap connecting one of said rock-shafts with the valve-lever of the air-pipe, substantially as shown and described.

388,235. TOBACCO-PIPE. THOMAS B. WHITLEDGE, GEORGE W. KEMPER, and HERMAN BEHRENS, St. Mary's, Mo. Filed Sept. 13, 1887. Serial No. 249,567. (No model.)

Claim.—1. The combination, with an apertured pipe-cap, of a pusher-rod, a pruner-disk carried by said rod, a bowl-cleaning arm carried by said disk, and a retracting-spring, arranged for operation substantially as shown and described.

2. The combination, with a ring adapted to fit a pipe-bowl, of an apertured dome-shaped cap hinged thereto, a pruner-rod held to slide in said cap, an apertured pruner-disk carried by said rod, a bowl-cleaning arm carried by said disk, a retracting-spring on said rod, and a spring-catch on the cap and ring, substantially as and for the purpose described.

3. The combination, with a cap hinged to a ring adapted to fit a pipe-bowl and provided with a web, g, said cap and web being apertured to form bearings A, of a rod, G, provided with a shoulder, i, a disk, H, a bowl-cleaning arm, J, and a spring, m, substantially as and for the purpose described.

4. The combination, with a cap hinged to a ring adapted to fit a pipe-bowl and provided with a web, g, said cap and web being apertured to form bearings A, and said web having slot S, of a rod, G, provided with shoulders i' and i, a disk, H, a bowl-cleaning arm, J, and a spring, m, substantially as and for the purpose described.

5. The combination, with a pipe-bowl, of an opening and closing apertured cover or lid provided with a pusher-stem having suitable

bearings in said lid, and having secured thereto a bowl-cleaning arm, *J*, substantially as described.

6. The combination, with the pipe-bowl, of an opening and closing apertured cover or lid, a sliding pusher-stem having bearings in said cover or lid, a spring for forcing said stem upward, and a bowl-cleaning arm connected to the pusher-stem, substantially as described.

7. The combination, with the pipe-bowl, of an opening and closing apertured cover or lid provided with a pusher-stem having suitable bearings in said lid for movement with and against a spring-pressure, and having secured thereto a pusher-disk, H, and a bowl-cleaning arm, *J*, substantially as and for the purpose described.

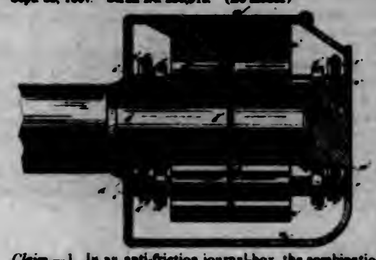
8. The combination, with the pipe-bowl, of an opening and closing apertured lid or cover of dome shape provided with a pusher-stem having bearings *h h* in said lid, provided with a pusher-disk, H, a bowl-cleaning arm, and a spiral spring, *m*, arranged between a shoulder, *l*, on the pusher-stem and the lower bearing, *h*, substantially as and for the purpose described.

388,236. PAPER-REEL. HOMER T. WILSON, Harrodsburg, assignor to the Merchants Roll Paper Printer and Cutter Company, Lexington, Ky. Filed Mar. 12, 1888. Serial No. 267,071. (No model.)

Claim.—1. In a paper-reel, the combination, with standards A A A, adapted to receive paper rolls of different widths, of shelves B B, uniting said standards and approximately parallel to a plane tangent to the lower side of said rolls, and vertically-adjustable tearing-bars fixed upon the upper surface of said shelves, respectively, whereby paper from said rolls passing along said shelves beneath said bar may be drawn out to any desired extent and then torn off along the edge of the bar.

2. In a paper-reel, the combination, with a paper roll revolubly and removably mounted in suitable supports, of a support for the paper when unrolled, a printing-roller suitably mounted and approximately tangent to the last-named support, said roller being adapted to be revolved by the passage of the paper between its surface and the surface of said tangent support and to imprint designs upon said paper, and ink-pad rollers revolubly mounted in contact with the surface of said printing-roller.

3. The combination, with a paper roll, *C*, revolubly mounted in supports provided with grooves *P*, of the plane shelf B, for supporting the unrolled paper, the open box K, hinged to said shelf and containing the revolubly-mounted printing-roller L and inking-rollers N, the auxiliary roller M, and the tearing-bar E, mounted upon said shelf between springs G and wing-nuts H, substantially as set forth.



4. In a paper-reel, the combination, with a paper roll mounted upon a rotary axis and a support for the paper coming from said roll, of a swinging printing-roller to rest upon the paper while passing over said support, to be rotated by the movement of the paper, and to be swung out of contact with the paper when desired.

388,237. SAND-BAND FOR WHEEL-HUBS. AARON WRIGHT, Hudson, N. Y., assignor of three-fourths to Gilbert Wright, Louis W. Grout, and Edwin Grout, all of same place. Filed May 1, 1888. Serial No. 272,553. (No model.)

Claim.—A wheel-hub having its inner end annularly recessed around the eye therein, the said recess being surrounded by the marginal plain surface of the hub, in combination with the metallic oil-cup, which is adapted to serve the additional function of a sand-band, having its inner edge flanged, as shown, to receive a packing and be secured to the said plain portion of the hub, and its outer edge curved inwardly and in close relation to the axle or spindle, substantially as and for the purposes specified.

388,238. CAR-AXLE BOX. DELOS ALLEN, Chicago, Ill. Filed Sept. 28, 1887. Serial No. 250,519. (No model.)

Claim.—1. In an anti-friction journal-box, the combination, with the outer frame and the boxing formed with a circular opening, and the shaft passed through the center of this opening, of a series of rollers placed around the shaft within the boxing and rolling in contact with both, a series of separating-rollers placed between the others and having their ends extended beyond the same, and a pair of disks formed at the ends of the journal-box, upon which these separating-rolls travel, substantially as and for the purpose set forth.

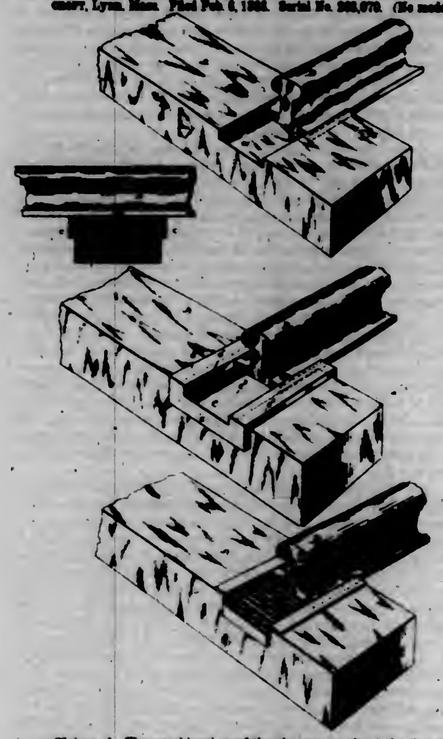
2. In an anti-friction journal-box, the combination, with the shaft, of a series of rollers placed around it, a circular boxing in which they run, a series of smaller separating-rollers placed between the others, and a pair of disks upon which the ends of these latter rollers are carried, and confining-rings placed around them, substantially as shown and described.

3. The combination, with the casing *a*, formed or provided with the disks *d*, the circular boxing *a'*, and shaft *b*, of the rollers *b'*, the separating-rollers *c c*, having their ends extended and provided with the enlargements *b'*, and the confining-rings *e*, formed with flanges *e'*, to fit the grooves c^2 in the separating-rollers, substantially as and for the purpose set forth.

388,239. PUMP. GEORGE W. ARNOLD and WILLIAM C. HILL, Mount Pleasant, Pa. Filed Dec. 2, 1887. Serial No. 256,513. (No model.)

Claim.—1. In a pump, the combination of the conical tube A, adapted to be secured in an opening in a barrel, the shell screwed to the outer end thereof and having an air-compressing pump attached thereto, the tube D, passing through the tube A and the shell, the tube H, having the spout K near its upper end, and the stop-cock L in the tube H at the inner end of the spout, substantially as and for the purpose specified.

2. In a pump, the combination of the conical tube A, the tube D, passing through the same and leaving an annular air-passage at the lower end of the said tube A, the shell B around the upper end of the tube D, forming the air-chamber E, which communicates with the interior of the tube A, the air-compressing pump connected to the shell, and the tube H, inserted in the upper end of the tube D and passing through a packing-box, I, and leaving the spout K attached thereto, substantially as and for the purpose specified.



3. In a pump, the combination of the conical tube A, the shell attached thereto and having a tube, P, on the side, the air-chamber E within the shell, having the perforations F in the bottom, which communicate with the tube A, the fluid-conducting tube passing through the tube A and the shell, and the air-compressing pump attached to the tube P, substantially as and for the purpose specified.

4. In a pump, the tube A, adapted to be inserted in the bung of a barrel and interiorly tapped at its upper end, the shell screwing at its lower end into the tube A and having the lateral flange C, the packing-ring *a* between the flange C and the upper end of the tube A, the fluid-conducting tubes passing through the tube and shell, and the air-pump connected to the interior of the shell, substantially as specified.

5. In a pump, the combination of the tube A, the shell secured in the upper end thereof and having a perforated bottom, the tube D, passing through the tube A and the shell and rigidly attached at its upper end to the shell, the adjustable tube H, sliding within the tube D and having a spout at its upper end, and the air-pump attached to the shell, substantially as specified.

6. In a pump, the combination of the tube A, shell B, connected thereto, the tube D, having the telescoping sections G and G', one of which passes through the tube A and shell B and is attached to the latter, and the air-pump connected to the shell and communicating with the space between the tube and the shell, substantially as specified.

388,240. CONSTRUCTION OF RAILROADS. EDWARD H. AMESBURY, Lynn, Mass. Filed Feb. 6, 1888. Serial No. 263,670. (No model.)

Claim.—1. The combination of the sleepers or ties A, having the recesses or channels *a*, the metal chair C, having the flanges *c*, and the side walls, *c'*, which are placed in said recesses or channels, with the rail B, the bases of which are placed on said chair between the side walls thereof, as and for the purposes described.

2. The combination of the sleepers A, having the cross channels or recesses *a*, the metal chair C, having the side walls, *c'*, and the outwardly-extending flanges c^2, and the rails B, the bases *a'* of which rest upon said chairs between the walls *c'*, as and for the purposes described.

3. The combination of the ties or sleepers A, having the cross channels or recesses *a*, the chair C, having the downward-extending flanges *c*, the walls *c'*, and the outwardly-extending flanges c^2, with the rails B, the bases *a'* of which rest upon the side chairs and each other, and the said walls *c'*, substantially as described.

4. The combination of the sleepers A, having the cross recesses or channels *a*, the chairs C, having the downward-extending flanges *c*, the walls *c'*, and the outwardly-extending flanges c^2, one or more plates interposed between the chair and the sleeper, and the rails B, the bases of which rest upon the upper surface of the chair between the walls *c'*, substantially as described.

5. The combination of a chair having the corrugated base or rail-supporting surface, with one or more additional corrugated re-enforcing plates, substantially as described.

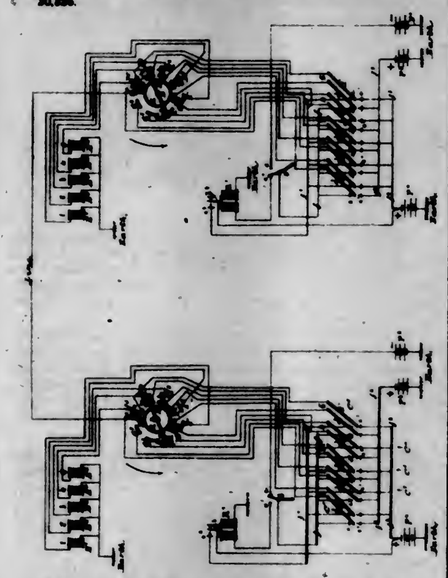
388,241. RAIL-FASTENING. GEORGE H. BABER, Philadelphia, Pa., assignor to William Wharton, Jr., and Company, Incorporated, same place. Filed May 4, 1888. Serial No. 272,771. (No model.)

Claim.—1. The combination of the rail with the tie-plate having lips overlapping one side of the base-flange of the rail, and having a raised lip and opening on the opposite side of said base-flange, with a brace-piece adapted to bear against the rail, and having a tail-piece adapted to said opening and confined to the rail by said lip of the tie-plate, all substantially as set forth.

2. The combination of the rail, the tie-plate having lips overlapping the base-flange of the rail, and having a raised lip, *c*, and opening *c'*, with a brace-piece provided with a tail-piece thicker than the said tie-plate and inserted beneath the lip *c*, so that as the pressure is applied to the tie-plate the brace-piece will be firmly locked in position, substantially as described.

388,242. PNEUMATIC INTERMITTENT CIRCUIT-CLOSER. WILLIAM C. RAMSEY, New York, N. Y., assignor to Josiah C. Reed, same place. Filed Feb. 7, 1887. Serial No. 226,851. (No model.)

Claim.—1. The combination, in a pneumatic instrument for sending intermittent impulses of electricity into a conductor, of a tympan in a case having an air-passage extending around the tympan, so that the air-waves will act first on one side of the tympan and afterward on the opposite side of it, an electrode in the center of the tympan and at each side thereof connected with one pole of a battery, and two electrodes connected with the other pole of the same battery and placed opposite to each other and to the intervening electrode on the tympan.



2. The apparatus, substantially as herein described, for reproducing vocal and other sounds, consisting of a tympan, a case for containing the same having an air-passage around the tympan, so that the air-waves will act first on one side of the tympan and afterward on the opposite side of it, an electrode in the center of the tympan connected with one pole of a battery, and two electrodes at opposite sides of the intervening electrode on the tympan, circuit-connections through such electrodes, a receiving telephonic instrument, and electric circuit-connections through such receiving-instrument, substantially as specified.

388,243. SHUTTLE-HEDDLE FOR LOOMS. Reuben Randalph, Woonsocket, R. I., assignor of one-half to Thomas C. Cooper, same place. Filed Nov. 28, 1887. Serial No. 256,286. (No model.)

Claim.—The combination, with the box A and the swell B, having the beveled end *e'*, of the reciprocable hinge-leaves D D', having the ribs *a a*, and the swell head portions *c* and *d d'*, the spring-plate C, secured between the leaf D and the box and having its end extending upon the portion *c*, the bolts *b*, and the nuts, substantially as specified.

388,244. PRINTING-TELEGRAPH. Jean M. E. Raudot, Paris, France. Filed Apr. 4, 1888. Serial No. 269,569. (No model.) Patented in France Jan. 6, 1883, No. 146,716; in Belgium Jan. 20, 1888, No. 80,893; in England Jan. 20, 1888, No. 486, and in Germany Feb. 4, 1888, No. 39,896.

Claim.—1. The combination, in a receiving-instrument, of a series of fingers with a combiner moving relatively to them and formed with rows of indentations (or equivalents) traversed by the fingers and arranged to be engaged by the latter according to as many different combinations as there are characters to be transmitted.

2. The combination, in a receiving-instrument, of a series of fingers, a combiner moving past them and formed with rows of indentations (or equivalents) traversed by the fingers and arranged relatively to the latter according to as many different combinations as there are characters to be transmitted, and electro-magnetic means for bringing the respective fingers into operative connection with the rows of indentations according to any desired combination, whereby when the combiner reaches the position corresponding to the particular combination for which the fingers are prepared it presents an indentation to each one of the series of fingers.

3. The combination, in a receiving-instrument, of a series of fingers, a combiner moving past them and formed with rows of indentations (or equivalents) traversed by the fingers and arranged relatively to the latter according to as many different combinations as there are characters to be transmitted, electro-magnets for actuating the respective fingers to bring them into operative connection with the rows of indentations, and a distributer for connecting said magnets successively with the line-circuit, whereby the combination, according to which said fingers are prepared for the combiner, is determined by the successive electric impulses acting upon said magnets.

4. The combination, in a receiving-instrument, of a combiner consisting of rows of indentations, a series of fingers traversed by said combiner and capable of being displaced to different positions relatively thereto according to as many different combinations as are to be transmitted, and electro-magnetic means for so displacing them.

5. The combination, in a receiving-instrument, of a combiner consisting of inversely-indented disks, a series of fingers traversed by said disks and each capable of being displaced from one disk to the other, having inversely-arranged indentations, and electro-magnetic means for so displacing them.

6. The combination, in a receiving-instrument, of a combiner consisting of two inversely-indented disks, a series of fingers traversed thereby normally in contact with one of said disks and capable of being displaced into contact with the other, electro-magnetic means for so displacing one or more of them according to any one of the different combinations for which the combiner is adapted, and mechanical means for restoring the displaced fingers to their normal position after the prepared combination has been translated.

7. The combination, in a receiving-instrument, of a combiner consisting of two inversely-indented disks, a series of tilting fingers traversed thereby normally in contact with one of said disks, but capable of being displaced into contact with the other, and the several fingers arranged to bear laterally upon one another in either position, whereby the first of the series cannot tilt upon encountering an indentation until all the others simultaneously encounter indentations, whereupon all the fingers tilt together, and electro-magnetic means for displacing the fingers according to different combinations.

8. The combination of electro-magnets for receiving the successive electric impulses constituting a signal, mechanical parts moved thereby, by which said signal is stored, and the relative positions of which constitute an image of the transmitted signal, a series of fingers, mechanism for transferring the impress of the signal from said storing parts to said fingers by displacing the latter according to the combination indicated by the positions of said parts, and a combiner consisting of inversely-indented disks traversing said fingers, one of them in contact with the fingers in their normal positions and the other in contact with the displaced fingers.

9. The combination of electro-magnets for receiving the successive electric impulses constituting a signal, a corresponding series of storing-switches capable each of occupying three positions and of being displaced from the first to the second position by the action of its corresponding magnet, a cam adapted to engage those of the switches that are in the second position and to move them to the third position, a series of fingers adapted to be displaced by the latter movement of the switches, and a combiner consisting of inversely-indented disks traversing said fingers, one of them in contact with the fingers in their normal positions and the other in contact with the displaced fingers.

10. The combination of two inversely-indented combiner-disks, a series of fingers arranged successively thereagainst, a cam on the front disk adapted as it passes said fingers to shift them all to the rear disk, a series of storage-switches corresponding to said fingers and each capable of occupying three positions, a series of electro-magnets adapted each to shift the corresponding switch from its first to its second position, and a cam revolving with the disks and adapted to engage all the switches that are in the second position and throw them as it passes to the third position, thereby displacing the corresponding fingers to the front disk.

11. The combination of two inversely-indented combiner-disks, a series of fingers arranged successively thereagainst, a series of storage-switches corresponding to said fingers and each capable of occupying three positions, a series of electro-magnets adapted each to shift the corresponding switch from its first to its second position, a cam revolving with the disks and adapted to engage all the switches that are in the second position and throw them as it passes to the third position, thereby displacing the corresponding fingers from the rear to the front combiner-disk, and another cam following the first and adapted to restore all the displaced switches to their first positions.

12. The combination of two inversely-indented combiner-disks, a series of fingers arranged successively thereagainst, a series of storage-switches in the form of elbow-levers, each capable of occupying three positions, a series of notched springs engaging said switches in their first positions, a series of electro-magnets adapted each to shift the corresponding switch from its first to its second position, and a cam adapted to engage those of the switches that are in the second position and to move them to the third position, thereby displacing the fingers from the rear to the front combiner-disk.

13. The combination, in a receiving-instrument, of a combiner consisting of two inversely-indented disks, a series of tilting fingers traversed thereby normally in contact with one of said disks, but capable of being displaced into contact with the other, and the several fingers arranged to bear laterally upon one another in either position, whereby the first of the series cannot tilt upon encountering an indentation until all the others simultaneously encounter indentations, whereupon all the fingers tilt together, a lever bearing against the series of fingers, and a spring pressing said lever against them and tending to tilt them.

14. The combination, to form a printing-telegraph receiver, of a series of fingers, a combiner moving past them and formed with rows of indentations (or equivalents) traversed by the fingers and arranged relatively to the latter according to as many different combinations as there are characters to be printed, a series of printing-types moving synchronously with said combiner, and a printing mechanism for bringing a band of paper against any of said types, actuated by the engagement of said fingers with said combiner, whereby when the combiner reaches the position corresponding to the particular combination for which the fingers are prepared the type for printing the character indicated by that combination is in the position to be printed, and the simultaneous engagement of the fingers with the combiner acts to effect the printing of said character.

15. The combination, to form a printing-telegraph receiver, of a series of tilting fingers, a rotary combiner formed with rows of indentations traversed by the fingers and arranged relatively to the latter according to as many different combinations as there are characters to be printed, electro-magnetic means for bringing the respective fingers into operative connection with the rows of indentations according to any desired combination, a type-wheel revolving synchronously with said combiner and having its types arranged so that as each different combination on the combiner comes into coincidence with the fingers the corresponding type reaches the printing position, and a printing mechanism actuated by the simultaneous engagement of the fingers with the combiner, and adapted thereupon to bring a band of paper against one of the types.

16. The combination, to form a printing-telegraph receiver, of a combiner consisting of inversely-indented disks, a series of fingers traversed by said disks and each capable of being displaced from one disk to the other, having inversely-arranged indentations, electro-magnetic means for so displacing them, a type-wheel revolving synchronously with said combiner, and a printing mechanism actuated by the simultaneous engagement of the fingers with the combiner, and adapted thereupon to bring a band of paper against one of the types.

17. The combination, to form a printing-telegraph receiver, of a series of tilting fingers, a rotary combiner formed with rows of indentations traversed by the fingers and arranged relatively to the latter according to as many different combinations as there are characters to be printed, whereby for each different combination the simultaneous dropping of all the fingers into said indentations will take place at a different point in the revolution, electro-magnetic means for bringing the respective fingers into operative connection with the rows of indentations according to any desired combination, a type-wheel revolving synchronously with said combiner and having its types arranged so that as each different combination on the combiner comes into coincidence with the fingers the corresponding type reaches the printing position, and a printing mechanism connected mechanically to the fingers and actuated by the simultaneous dropping thereof into indentations in the combiner, and adapted thereupon to bring a band of paper against one of the types.

18. In a printing-telegraph receiver, the combination of a continuously-revolving type-wheel, an impression-arm adapted, when released, to move into engagement with the type-wheel, and thereby in passing to press a band of paper against one of the types thereof, a detent normally restraining said impression-arm, automatic translating mechanism for determining the instant at which to release the impression-arm in order to print the proper type, connected to and actuating said detent, and a restoring mechanism consisting of a cam moving with the type-wheel and a lever engaged thereby, which moves back the impression-arm.

19. In a printing-telegraph receiver, the combination of a continuously-revolving type-wheel, a toothed wheel revolving therewith, an impression-arm adapted, when released, to move into engagement with the teeth of said toothed wheel and to be carried thereby past the type-wheel, thereby bringing a band of paper against one of the types thereof, a detent for normally restraining said impression-arm, and a restoring mechanism for moving back said arm.

20. In a printing-telegraph receiver, the combination of a continuously-revolving type-wheel, an impression-arm adapted, when released, to move into engagement with the type-wheel, and thereby in passing to press a band of paper against one of the types thereof, a detent normally restraining said impression-arm, a feeding-roller mounted on the axis around which said arm vibrates and formed with ratchet-teeth, a pawl engaging said teeth and carried by said arm, whereby the paper is advanced with said arm during the printing movement thereof, a second pawl engaging said teeth and preventing the backward movement of said roller during the return of said arm, and a restoring mechanism for moving back said arm.

21. The combination, with a printing-telegraph receiver, of a synchronizing mechanism consisting of a fly-wheel in connection with the revolving printing-shaft, an electro-magnetic brake acting against said fly-wheel, and a circuit-closer in the circuit traversing the coils of said magnet, operated to close the circuit at regular intervals.

22. The combination of a distributer at the transmitting-station, a distributer said printing-receiver at the receiving-station, and a synchronizing mechanism for the two sets of apparatus, consisting of circuit-closers on both apparatus for closing the circuit at each revolution and an electric brake applied to the governed apparatus, whereby the acceleration of speed acquired by the latter is neutralized by the action of said brake, and the brake is applied for a duration proportional to the advance of the governed over the governing apparatus.

23. The combination, to form a distributer, of a series of contacts arranged annularly, a second series of contacts, also arranged annularly and angularly adjustable relatively to the first series, a revolving arm moving over said contacts, and conducting-brushes mounted on said arm and sweeping said contacts.

24. A manipulator consisting of circuit-closing springs vibrating between two opposite contact-buttons, the buttons of one series being connected to the positive pole of a battery and those of the opposite series being connected to the negative pole of another battery, in combination with a distributer serving to connect the respective springs to the line successively, whereby the successive impulses transmitted are of one polarity or the other, according to the order in which the springs are depressed.

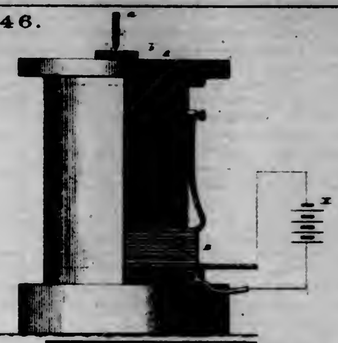
25. A manipulator consisting of a series of finger-keys, two circuit-closing springs under each key, connections between the first spring of each key and the line-circuit, whereby these springs serve for transmitting the signals to the distant station, a receiving-instrument at the sending-station, and connections between the second spring of each key and this instrument, whereby these springs serve to reproduce the transmitted signal in this instrument.

26. The combination of a manipulator consisting of a series of finger-keys and two circuit-closing springs under each key, a receiving-instrument, and a distributer consisting of a revolving arm carrying contact-brushes, a series of successive contacts connected to the first springs of the respective keys and swept by the first brush, whereby the currents from these keys are sent to line successively, and two series of successive contacts arranged in pairs and swept by the other brush, the contacts of one series being connected with the second springs of the respective keys and the contacts of the other series being connected to the electro-magnets of the receiving-instrument.

27. The combination, with the distributer, of a series of keys, each consisting of a circuit closing or breaking spring or springs, a finger key or lever for operating it or them, a metronome electro-magnet, and an armature mounted on said key and arranged to make contact with said magnet when the key is depressed, and thereby to hold the key depressed as long as the magnet remains active.

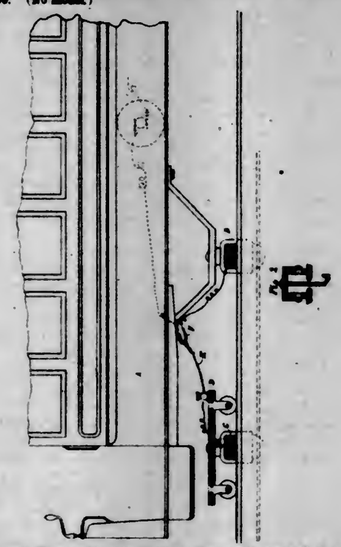
28. The combination of a manipulator consisting of five keys assembled in one instrument, a distributer for connecting said keys successively to line, a receiving-instrument having five magnets for receiving the five successive currents, and a distributer at the receiving-station for distributing the five successive currents to the respective magnets, whereby thirty-two different signals may be transmitted by depressing the manipulator-keys in different combinations.

388,245. METHOD OF WORKING METALS BY ELECTRICITY. Nikolas Benardos, St. Petersburg, Russia. Filed June 6, 1888. Serial No. 276,279. (No model.)



Claim.—In the hereinbefore-described process of welding or working metals by means of the electric arc, the method of improving the metal and enhancing the efficiency of the arc, which consists in subjecting the same to the influence of an electro-magnet, in the field of which the arc is maintained during the welding operation, substantially as and for the purposes hereinbefore set forth.

388,246. APPARATUS FOR WORKING METALS BY ELECTRICITY. Nikolas Benardos, St. Petersburg, Russia. Filed June 6, 1888. Serial No. 276,280. (No model.)

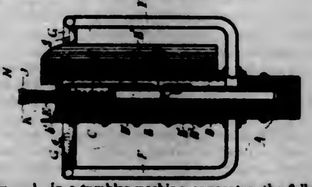


Claim.—1. An electro-magnetic anvil or supporting-table for metals to be worked or welded by the electric arc, in combination with appliances for forming said arc, substantially as hereinbefore set forth.

2. An anvil or supporting-table for metals to be worked or welded by the electric arc, made of material suitable to form the core of an electro-magnet, surrounded by an insulated coil, which is included in the circuit of the said arc, substantially as and for the purposes hereinbefore set forth.

388,246.

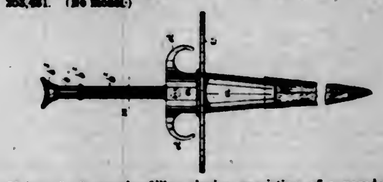
388,247. CURRENT-COLLECTOR FOR ELECTRIC RAILWAYS. Josiah L. Blackwell, New York, N. Y. Filed July 3, 1883. Serial No. 278,959. (No model.)



Claim.—1. The combination, with an electrically-propelled vehicle provided with a normal contact device, of a supplementary contact device provided with a truck adapted to ride on the surface of the conduit, and a wire for connecting it to the vehicle.

2. The combination, with an electrically-propelled vehicle having a normal contact device and an exposed hook or connection-point in electrical communication with the propelling-motor, of a supplementary contact device having a truck adapted to ride upon the surface of the conduit, with means for connecting it to the said exposed point.

3. A supplementary contact device for an electric railway having a truck adapted to ride on the surface of a conduit, and a contact-piece thinner than the width of the slot, so as to be inserted therein at any point.



388,248. TUMBLER-WASHER. Andrew Blair, Philadelphia, Pa. Filed Oct. 17, 1887. Serial No. 252,857. (No model.)

Claim.—1. In a tumbler-washing apparatus, the following elements in combination: a tube, D, provided with holes or openings D^2, a sleeve or sliding tube, C, adapted to slide under pressure over the tube D, and likewise provided with holes or openings D', the said holes or openings so relatively disposed to each other that when pressure is communicated to the sleeve C said sleeve will slide over the tube D until the holes or openings in the respective tubes are in line with each other and form outlets for the escape of the water from the tube D to an outer tube or casing, B, an outer tube or casing, B, provided with a series of perforations for the escape of water to the interior of the tumbler, and with internally-extending horizontal rubbers adapted to come in contact with the inner side of the tumbler, and a spring, H, for raising and supporting the sleeve or sliding tube C when pressure is removed therefrom and preventing the further escape of water, the whole arranged and operating substantially as described, and for the purposes set forth.

2. In a tumbler-washing apparatus, in connection with a water-supply, the combination of the tube B, mounted on the coupling A, having attached thereto rubbers B^2, for cleaning the interior of the tumbler, and provided with a series of orifices or perforations along its length and at its top for the discharge of water to the interior of the tumbler, the tube D, mounted on the coupling A, closed at its upper end and provided along its length with holes or openings D^2, a sleeve or sliding tube, C, fitting closely over the tube D, and provided along its length with holes or openings D^2, and adapted under pressure to slide over the tube D, said holes or openings D' and D^2 so relatively disposed to each other as to come in line when pressure is communicated to the sleeve C, and form outlets for the escape of water from the tube D to the tube B, the hollow rod or stem E, mounted on the sleeve or sliding tube C, the rod I, mounted on the tube D, extending up through the top of the sleeve C and into the hollow rod or stem E, mounted on the sleeve C, when the latter is forced downward, a spiral spring, H, on the rod I, for raising and supporting out of section the sleeve C when pressure is removed from the same, and cutting off the flow of water from the tube D, a set-screw or pin on the tube D, operating in the slot or opening in the sleeve C, to steady and guide the sleeve C when forced over the tube D, the rotary head J, mounted on the upper end of the rod or stem E, and a cushion, N, on said rotary head, on which to seat the tumbler, the pipes or conduits F F', supporting and opening into the perforated annular tube G, and the perforated annular tube G, from which water is discharged directly to the exterior of the tumbler through the orifices or perforations g in the same, the whole arranged and operating substantially as described, and for the purposes set forth.

388,249. POWDER-FILLER. George Blan, Newark, N. J., assignor to Lilie H. Bates, same place. Filed Oct. 26, 1887. Serial No. 253,491. (No model.)

Claim.—1. A powder-filling device consisting of a powder-receptacle having finger-hooks thereon, and a guard around said receptacle between the hooks and the end of said receptacle which is inserted into the powder, and a plunger working within said powder-chamber, whereby the powder is expelled from said powder-chamber, substantially as specified.

2. A powder-filling device consisting of a powder-receptacle provided with finger-hooks thereon, a guard around the same arranged between said hooks and the end thereof which is inserted into the powder, said end being tapering and also provided with a powder-chamber within the same, and a plunger working within said powder-chamber, substantially as and for the purposes set forth.

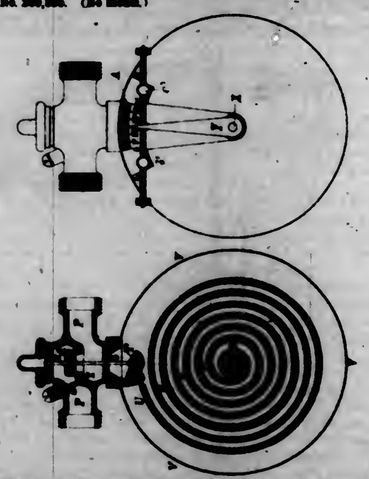
3. A powder-filling device consisting of a powder-receptacle provided with finger-hooks thereon and a powder-chamber within the same, and a spring-actuated plunger moving within said powder-chamber and normally held by the action of the springs away from the mouth or open end of said chamber, substantially as and for the purposes set forth.

4. A powder-filling device consisting of a powder-receptacle provided with hooks thereon, and a guard arranged around said receptacle between the hooks and the end thereof, and provided with a powder-chamber within the same, within which moves a spring-actuated plunger, substantially as and for the purposes set forth.

5. A powder-filling device consisting of a powder-receptacle having a powder-chamber within the same and finger-hooks thereon, and a plunger moving within said powder-chamber, provided with a slot, b^2, therein, and a detent engaging with said slot, for the purposes set forth.

6. A powder-filling device consisting of a powder-receptacle provided with a powder-chamber therein and finger-hooks thereon, and a tubular plunger moving within said powder-chamber, provided with a slot, b^2, therein, a spring arranged within said tubular plunger, and a stop, b^3, substantially as and for the purposes set forth.

7. A powder-filling device consisting of a powder-receptacle provided with a powder-chamber therein and finger-hooks thereon, a spring-actuated plunger moving within said powder-chamber and provided with a slot, b^2, therein, and a set-screw arranged in said powder-receptacle and adapted to engage with said slot b^2 in the plunger, substantially as and for the purposes set forth.

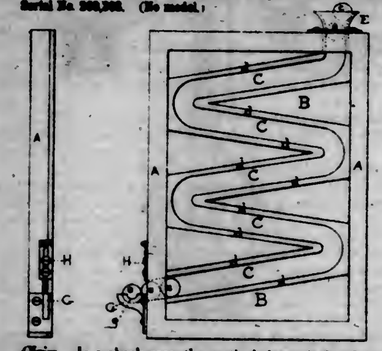


8. A powder-filling device consisting of a powder-receptacle provided with a powder-chamber therein, finger-hooks thereon, and a guard arranged between said finger-hooks and the end of the powder-receptacle, which is inserted into the powder, a spring-actuated plunger working within said powder-chamber, provided with a slot, b^2, therein, and a set-screw adapted to enter said slot b^2 and limit the movement of the plunger, substantially as and for the purposes set forth.

9. A powder-filling device consisting of a powder-receptacle, *c*, having a powder-chamber, *c'*, therein, finger-hooks *d* thereon, and a guard, *e*, thereround, a tubular plunger moving within said powder-chamber, provided with slots b^2 and b^3, a spring arranged within said tubular plunger, which has a stop, b^3, thereon, and a set-screw arranged in said receptacle and adapted to enter said slot b^2 to limit the movement of said plunger, substantially as and for the purposes set forth.

10. A powder-filling device consisting of a powder-receptacle, *c*, having a powder-chamber, *c'*, therein, finger-hooks *d*, cast integrally with said powder-receptacle, and a guard, *e*, arranged thereround between said hooks *d* and the end *e'* the receptacle which is inserted into the powder, said end being tapering, a tubular plunger moving within said powder-chamber, having a spring arranged therein, and slots b^2 and b^3, a stop, b^3, and a set-screw arranged in said receptacle and adapted to enter into engagement with said slot b^2 to limit the movement of the plunger, substantially as and for the purposes specified.

11. A powder-filling device consisting of a powder-receptacle provided with a powder-receiving chamber therein, the sides of which are parallel, the outside of said receptacle tapering toward the mouth of said chamber, and a plunger moving reciprocally within said chamber, for the purposes set forth.



388,250. AUTOMATIC TEMPERATURE-REGULATOR. Otto Blum, Stuttgart, Wurtemberg, Germany. Filed Apr. 8, 1886. Serial No. 198,080. (No model.)

Claim.—1. The combination, with a hollow cylindrical case and a cock mounted thereon, said cock having within it a valve and valve-stem by the motion of which the flow of a current of gas passing through said cock is controlled, of a spiral spring within said case, attached by its inner end to a shaft within the interior of said case and having its outer end bearing upon a lever pivoted to said cock, said spring being composed of two strips of two different kinds of metal, of equal length and of different dilatability, so arranged that the more expansive metal is placed within, so that as the spring is heated it will tend to unwind and as it grows cooler will tend to wind up, a lever pivoted to said cock, moved by said spiral spring, and itself bearing upon and moving said valve-stem to control the flow of gas as aforesaid, an index-hand mounted upon said shaft without the said case and moving upon a graduated arc upon the exterior of said case, and two screws working in nuts attached to said case, one screw on either side of said index-hand, to limit its motion, substantially as and for the purposes set forth.

2. The combination, with the cylindrical case V and the cock P, mounted upon said cylindrical case, the valve Q and its stem, the screw *c*, and the hole *c* within said cock, of the lever T, pivoted to said cock, the spring U, attached by its inner end to the shaft X and bearing with its outer end upon the lever T, the shaft X, journaled in said cylindrical case, the index-hand Y, mounted upon said shaft, moving upon the graduations A, the graduated arc A, and the screws *b* and *c*, working in nuts upon said case and limiting the motion of said index-hand, all substantially as and for the purposes set forth.

388,251. CHECK-CASE. George R. Bowen, Auburn, N. Y., assignor of one-half to John H. Lynch, same place. Filed Jan. 11, 1888. Serial No. 260,268. (No model.)

Claim.—In a check-case, the vertical zigzag inclosed track C C, formed of the channeled strips *d d*, and provided with a cover to retain the checks from falling forward, in combination with an external fixed receiver, G, adapted to hold one check at a time, said receiver extending upward at the back of the check to its middle point, and provided with the recesses *g* in its sides to enable the check to be grasped, substantially as described.

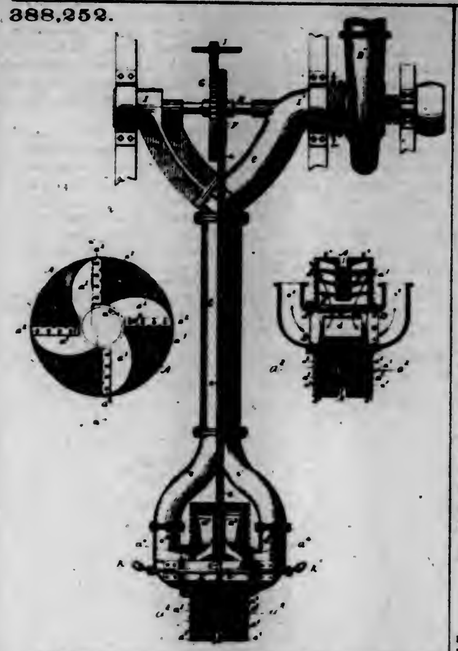
388,252. HYDRAULIC DREDGING APPARATUS. Alfred R. Bowers, San Francisco, Cal. Original application filed Dec. 9, 1879. Renewed Apr. 16, 1879. Divided and this application filed Aug. 6, 1887. Serial No. 246,269. (No model.)

Brief.—A rotary excavator in combination with and mounted transversely to a suction-pipe, said excavator being provided with devices whereby it is enabled to work with an axial feed or swing in both directions, also with peripheral devices that enable it to cut in a plane perpendicular to its axis of rotation, and with fenders to prevent its cutting-edges from catching against obstructions.

Claim.—1. In combination, a suction-pipe and a rotary excavator having its axis transverse to said pipe, said excavator being provided with axial excavating devices constructed to work with an axial or end feed, and means for giving to said excavator an axial swing.

2. In combination, a suction-pipe and a rotary excavator having its axis transverse to said pipe, said excavator being provided with axial excavating devices and detachable cutting-edges.

3. In combination, a suction-pipe and a rotary excavator having its axis transverse to said pipe, said excavator being provided with axial excavating devices, and fenders to protect said devices.



4. In combination, a suction-pipe and a rotary excavator having its axis transverse to said pipe, said excavator being provided with axial excavating devices, and a device for excluding substances too hard and coarse to pass through the raising and discharging apparatus.

5. In combination, a suction-pipe, a rotary excavator having its axis transverse to said pipe, said excavator being provided with axial excavating devices, detachable cutting-edges, and fenders to protect said edges.

6. In combination, a suction-pipe, a rotary excavator having its axis transverse to said pipe, said excavator being provided with axial excavating devices and detachable cutting-edges, and a device for excluding coarse hard substances from the suction-pipe.

7. In combination, a suction-pipe and a rotary excavator having its axis transverse to said pipe, said excavator being provided with axial excavating devices having an inward delivery through themselves to said pipe.

388,252.

8. In combination, a suction-pipe and a rotary excavator having its axis transverse to said pipe, said excavator being provided with axial excavating devices armed with detachable cutting-edges and having an inward delivery through themselves to said pipe.

9. In combination, a suction-pipe and a rotary excavator having its axis transverse to said pipe, said excavator being provided with axial excavating devices having an inward delivery to said pipe, and fenders to protect said devices.

10. In combination, a suction-pipe and a rotary excavator having its axis transverse to said pipe, said excavator being provided with axial excavating devices having an inward delivery, and a device for excluding coarse hard substances from said pipe.

11. In combination, a suction-pipe and a rotary excavator having its axis transverse to said pipe, said excavator being provided with axial excavating devices having an inward delivery, detachable cutting-edges, and fenders to protect said edges.

12. In combination, a suction-pipe, a rotary excavator having its axis transverse to said pipe, said excavator being provided with axial excavating devices having an inward delivery and detachable cutting-edges, and a device for excluding coarse hard substances from said pipe.

13. In combination, a suction-pipe and rotary excavator having its axis transverse to said pipe, said excavator being provided with bottomless buckets having axial excavating-edges.

14. In combination, a suction-pipe and a rotary excavator having its axis transverse to said pipe, said excavator being provided with bottomless buckets having detachable side or axial cutting-edges.

15. In combination, a suction-pipe and a rotary excavator having its axis transverse to said pipe, said excavator being provided with bottomless buckets having side or axial cutting-edges, and fenders to protect said edges.

16. In combination, a suction-pipe and a rotary excavator having its axis transverse to said pipe, said excavator being provided with bottomless buckets having side or axial cutting-edges, and a device to exclude coarse hard substances.

17. In combination, a suction-pipe and a rotary excavator having its axis transverse to said pipe, said excavator being provided with bottomless buckets having detachable side or axial cutting-edges, and fenders to protect said edges.

18. In combination, a suction-pipe, a rotary excavator having its axis transverse to said pipe, said excavator being provided with bottomless buckets having detachable side or axial cutting-edges, and a device for excluding coarse hard substances from the suction-pipe.

19. In combination, a suction-pipe, a rotary excavator having its axis transverse to said pipe, said excavator being provided with axial excavating devices, a chain-wheel, and an endless chain actuated by a chain-wheel in the axis or center of oscillation of said suction-pipe.

20. In combination, a suction-pipe and rotary excavator, consisting of a chain-wheel provided with axial excavating devices constructed to work with an axial or end feed, and means for giving to said excavator an axial swing.

21. In combination, a suction-pipe and a rotary excavator consisting of a chain-wheel provided with axial excavating devices and detachable cutting-edges.

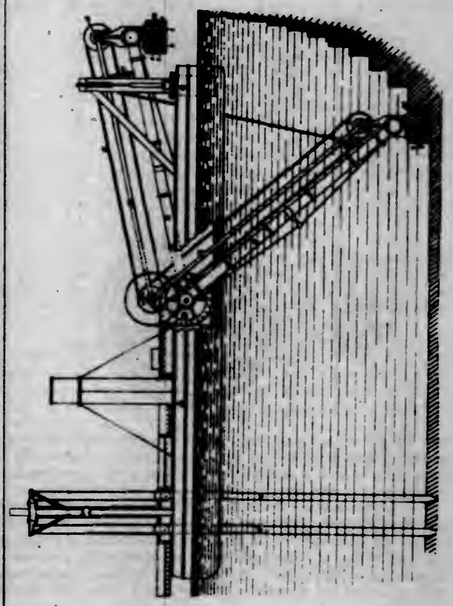
22. In combination, a suction-pipe and a rotary excavator consisting of a chain-wheel provided with axial excavating devices, and fenders for the protection of said devices.

23. In combination, a suction-pipe and a rotary excavator consisting of a chain-wheel provided with axial excavating devices, and a device for excluding coarse substances from said pipe.

24. In combination, a suction-pipe and a rotary excavator consisting of a chain-wheel provided with detachable axial excavating-edges, and fenders to protect said edges.

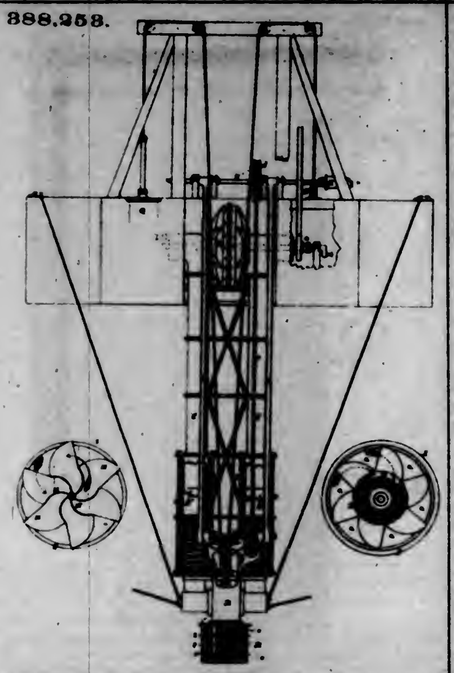
25. In combination, a suction-pipe and a rotary excavator consisting of a chain-wheel provided with axial excavating devices, detachable cutting-edges, and a device for excluding coarse substances from the suction-pipe.

26. A rotary excavator consisting of a chain-wheel provided with axial excavating devices, and fenders for the protection of said devices.



27. A rotary excavator provided with axial excavating devices on each end to excavate in each direction and deliver the spoil inward between said devices.

28. A rotary excavator provided with axial excavating devices, and with detachable fenders for the protection of said devices and to prevent them from catching against obstructions, and with means for giving to said excavator an axial swing.



388,253. DREDGING-MACHINE. Alphonso B. Bowers, San Francisco, Cal. Original application filed Dec. 9, 1878. Renewed Apr. 16, 1888. Divided and this application filed Apr. 30, 1888. Serial No. 272,262. (No model.)

Brief.—An excavating implement working with a side feed mounted on a swinging suction pipe or ladder, so as to preserve a horizontal position of its bottom cutting-edges at whatever angle the pipe or ladder may be placed and make a level or nearly level cut the whole width of the excavator and length of swing, strengthening and stiffening the suction-pipes and combining them by trusses and braces into a rigid structure or ladder for the support of the excavator and to resist the various strains thereon.

Claim.—1. In combination, a swinging suction-pipe, an excavator with side cutting-edges constructed and arranged to work with a side feed, and a device to hold said excavator in position to make a

388,253.

horizontal cut and level bottom at the different angles in which the suction-pipe is placed in the process of dredging.

2. In combination, a swinging suction-pipe, an excavator with bottom cutting-edges constructed and arranged to work with a side feed, and a device to hold said excavator in position to make a horizontal cut and level bottom at the different angles in which the suction-pipe is placed in the process of dredging.

3. In combination, a swinging suction-pipe, ladder, and excavator with side cutting-edges constructed and arranged to work with a side feed, and a device to hold said excavator in position to make a horizontal cut and level bottom at the different angles in which the suction-pipe is placed in the process of dredging.

4. In combination, a swinging suction-pipe, a hollow excavator with side cutting-edges constructed and arranged to work with a side feed, and a device to hold said excavator in position to make a horizontal cut and level bottom at the different angles in which the suction-pipe is placed in the process of dredging.

5. In combination, a swinging suction-pipe, ladder, and hollow excavator with side cutting-edges constructed and arranged to work with a side feed, and a device to hold said excavator in position to make a horizontal cut and level bottom at the different angles in which said pipe and ladder are placed in the process of dredging.

6. In combination, a swinging suction-pipe, a rotary excavator with side cutting-edges constructed and arranged to work with a side feed, and a device to hold said excavator in position to make a horizontal cut and level bottom at the different angles in which the suction-pipe is placed in the process of dredging.

7. In combination, a swinging suction-pipe, ladder, and rotary excavator with side cutting-edges constructed and arranged to work with a side feed, and a device to hold said excavator in position to make a horizontal cut and level bottom at the different angles in which the pipe and ladder are placed in the process of dredging.

8. In combination, a swinging suction-pipe, a hollow rotary excavator with side cutting-edges constructed and arranged to work with a side feed, and with inward delivery through itself to said pipe, and a device to hold said excavator in position to make a horizontal cut and level bottom at the different angles at which the pipe is placed in the process of dredging.

9. In combination, a swinging suction-pipe, ladder, a hollow rotary excavator with side cutting-edges constructed and arranged to work with a side feed and with inward delivery through itself to said pipe, and a device to hold said excavator in position to make a horizontal cut and level bottom at the different angles in which said pipe and ladder are placed in the process of dredging.

10. In combination, a swinging section of suction-pipe provided with swinging or hinged joints at or near each end thereof, an excavating implement at the outer end of said pipe, and a swinging parallel bar constructed and arranged to form with said pipe and excavator a swinging parallelogram with parallel movements to hold said excavator in position to make a horizontal cut and level bottom at the different angles in which said pipe and bar are placed in the process of dredging.

11. In combination, a swinging ladder, an excavating implement hinged to its outer end, and a swinging parallel bar constructed and arranged to form with said ladder and excavator a swinging parallelogram with parallel movements to hold said excavator in position to make a horizontal cut and level bottom at the different angles in which said ladder and bar are placed in the process of dredging.

12. A ladder for dredging purposes constructed with hollow or tubular sides united by cross-bars and stiffened by vertical trussing and diagonal bracing.

13. Pipes C C, one or both being employed for suction, said pipes being also properly trussed and braced to serve as a ladder, in combination with an excavating implement constructed and arranged to work with a side feed.

14. Pipes C C, one or both being employed for suction, said pipes being also braced to serve as a ladder, in combination with a hollow excavating implement constructed and arranged to work with a side feed.

15. Pipes C C, one or both being employed for suction, said pipes being also properly trussed and braced to serve as a ladder, in combination with a rotary excavator.

16. Pipes C C, one or both being employed for suction, said pipes being also braced and trussed to serve as a ladder, in combination with a hollow rotary excavating implement with inward delivery through itself to said conduit.

17. Pipes C C, one or both being employed for suction, said pipes being also properly trussed and braced to form a ladder, a rotary excavator at the outer end thereof, and a device for holding said implement in position to make a horizontal cut and level bottom at the different angles in which said ladder is placed in the process of dredging.

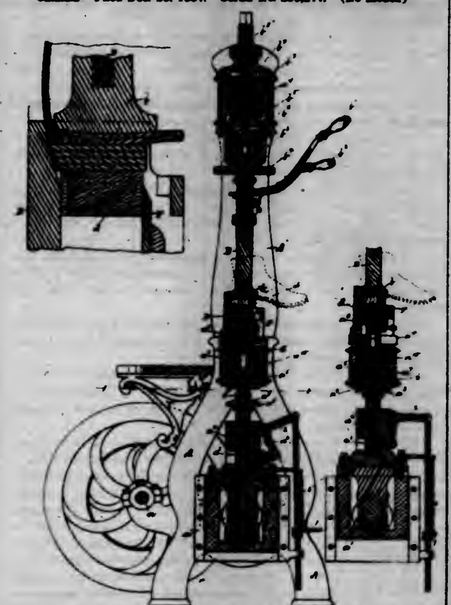
18. In combination, a swinging suction-pipe, a hollow rotary excavator with inward delivery through itself to said pipe at the outer end thereof, and an endless chain for actuating said excavator.

19. In combination, a suction-pipe having a telescoping section provided with a spiral spring passing around said section constructed and arranged to yield to heavy pressure and allow the pipes to telescope and to extend the telescoping section when the pressure is removed.

20. In combination, a suction-pipe having a telescoping section, a spiral spring to extend said section, and sliding guide rods to keep the telescoping section in line.

21. The combination of a suction-pipe and excavator constructed to be raised and lowered by swinging in a vertical plane, said excavator being provided with devices to effect a side feed, and with an automatic device to hold the excavator in position to cut and make a level bottom, at whatever angle the suction-pipe may be placed in the process of dredging.

388,254. SNAP-HOOK. Everal Bradley, Trumansburg, N. Y. Filed June 2, 1888. Serial No. 275,819. (No model.)



Claim.—1. The combination, with the hook-body A, provided with a loop, B, and forwardly-extending hook C, and beveled shoulders *b*, of the spring-actuated hook C, provided with a shoulder, *b'*, the free ends of the said hooks C C being curved outwardly in opposite directions, and the shoulders *b b'* being correspondingly laterally enlarged, substantially as herein set forth.

2. The combination, with the hook-body A, provided with perforated ears *a a*, a loop, B, and forwardly-projecting hook C, and beveled shoulder *b*, one of the said ears *a* being provided with a shoulder, *f'*, of a movable hook, C', provided with a lateral beveled shoulder, *b'*, and a downward extension, *e*, this portion C' being pivoted between the said perforated ears *a a*, and also provided with a lateral lug, *f*, and a spiral spring inserted in a cavity in the body A and adapted to bear against the said extension *e* and hold the hooks closed, substantially as described.

3. The combination, with the body A, provided with a loop, B, and a hook, C, and a pair of perforated ears, *a a*, and a slightly-curved portion, *f*, between these ears, of a movable hook, C', pivoted between the said ears *a a* and provided with a downward extension, *e*,

and a spiral spring, E, inserted in a cavity in the body A, and adapted to press with its rear end upon the said extension *e* and hold the hooks normally closed, the rear end of the said spring being turned in toward its center, as at *g*, substantially as described.

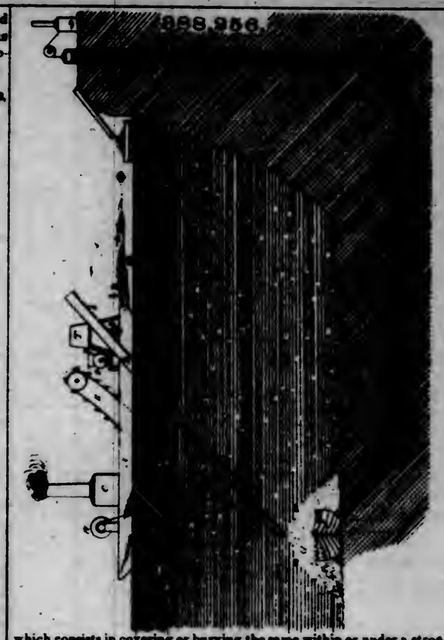
388,255. HEEL-MACHINE. Guillaume Barbe, Quebec, Quebec, Canada. Filed Dec. 20, 1887. Serial No. 258,277. (No model.)

Claim.—1. In a heeling-machine, the double-jointed arm B, composed of the parts b^3 and the swinging part carrying the shoe *b*, connected by a link and two pins, in combination with heel-block D, the handle b^7 being fast to the link and the handle b^8 being fast to the swinging part of the arm, substantially as and for the purpose specified.

2. In a heeling-machine, mold D and driver-plate a^4, and mechanism, substantially such as described, for moving driver-plate a^4 within mold D for a certain part of the stroke of the driver-plate a^6 and moving mold D and driver-plate a^4 together during the latter part of the stroke of the driver-plate a^6, the mold, driver-plate, and actuating mechanism being combined and operating substantially as described.

3. In a heeling-machine, mold D, heel-block *d*, driver-plate a^4, and breasting-knife F, the breasting-knife being fast to the driver-plate a^4, in combination with plungers a^3 and a^{10} and actuating mechanism, substantially such as described, by which plunger a^3 is moved independently of plunger a^{10} during the first part of the stroke of plunger a^3, but these plungers are moved together during the latter part of the stroke, all substantially as and for the purpose specified.

4. In combination, heel-block *d*, mold D, driver-plate a^4, and especial mechanism for combining them, consisting of spline G and plungers a^3 a^{10}, all substantially as described.



5. The improved heeling-machine above described, consisting of the heel-clamp *b d*, mold D, driver-plate a^4, and breast-knife F, with actuating mechanism, substantially such as described, to impart the differential motion to the driver-plate a^4 and mold D.

6. In a heeling-machine, the stationary spline G, supporting the heel-block *d*, the plunger a^3, supporting the driver-plate a^4, and the plunger a^{10}, supporting the mold D, in combination with plunger a^4, block a^5, and block a^2, all substantially as described.

388,256. RECOVERING VALUABLE CONTENTS FROM SUNKEN SHIPS. John H. Brown, Baltimore, Md., assignor to Morgan R. Wise, Salero, Ariz. Filed Jan. 12, 1888. Serial No. 260,540. (No model.)

Claim.—1. The method of recovering treasure or valuables lost at sea by enveloping or burying in its position under water the treasure or thing to be recovered in a strong water-proof crust or coating, then making an opening from above water-surface into said inclosing-coating, and removing the inclosed contents through said opening, substantially as described.

2. The method of recovering goods or treasure from deep water,

388,256.

which consists in covering or burying the same within or under a strong water-proof composition which will set or harden under water around and over the thing to be procured, then making an entrance into the incasing material from a point above water and removing the same through said entrance or passage-way, substantially as set forth.

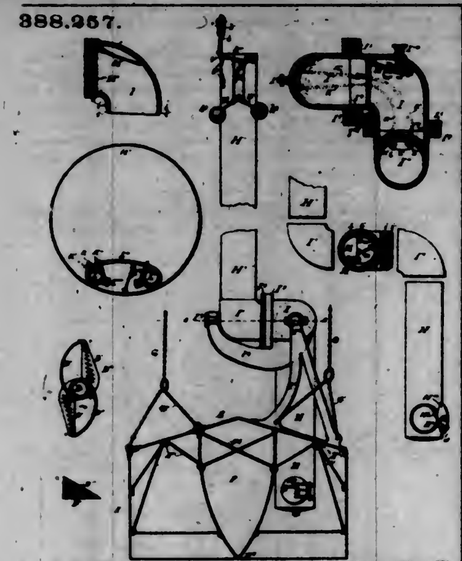
3. The process of removing valuables from under water, which consists of covering and incasing the same in a strong water-proof covering, then tunneling under and into said covering and removing said valuables through said tunnel, substantially as set forth.

4. The herein-described method of recovering the contents from a sunken ship, which consists in forming a béton monolith covering over and around the ship, then opening a passage-way into said monolith and removing the inclosed contents of the ship through said opening, substantially as set forth.

5. The method of removing the contents of a sunken ship, which consists in first entirely incasing the ship with impermeable material, then making a passage-way from above water into the ship and removing the contents of the ship through said passage-way, substantially as set forth.

6. The method of recovering the contents from a sunken ship, by first covering the ship with béton or its equivalent, then making a passage-way into said béton covering and ship and removing the contents of the ship through said passage-way, substantially as set forth.

7. The method of gaining entrance into and removing the contents out of a sunken ship, which consists in first entirely covering the ship with béton or its equivalent, then sinking a shaft on adjacent land or in adjacent water away from swift currents of water to a depth below the level of the river or sea bed, then tunneling to a point under or near the sunken and incased ship, then cutting up into the ship and removing its contents through said tunnel and shaft, substantially as set forth.



8. The method of procuring valuables sunk in water, which consists in inclosing the same in quick-setting cement during the successive intervals of still water between ebb and flow of tides, then making a passage-way into the inclosed space and removing said valuables through said passage-way, substantially as set forth.

9. The process of removing valuables from sunken vessels, which consists in incasing the sunken vessel in a monolith covering, making a passage-way into said monolith, exhausting the inclosed water therefrom, and then removing the other contents through said passage, substantially as set forth.

388,257. APPARATUS FOR RECOVERING VALUABLE CONTENTS FROM SUNKEN SHIPS. John H. Brown, Baltimore, Md., assignor to Morgan R. Wise, Salero, Ariz. Filed May 16, 1888. Serial No. 267,440. (No model.)

Claim.—1. A diving-bell or caisson provided with a fixed por-

388,257.

tion of shaft H, in combination with a swinging floating portion, H', these parts being united by flexible connections to constitute a universal joint and to permit the passage of men therethrough to and from the caisson, substantially as described.

2. A portable caisson, in combination with an air-filled shaft closed at top and bottom and having a flexible portion whereby water-currents may carry it into an inclined position below water-surface, and whereby the inclosed air will cause it to float or its upper end to rise above water-surface whenever such currents cease, substantially as set forth.

3. A submerged caisson, in combination with a jointed shaft attached thereto and adapted to yield or leave its vertical position when struck by moving ships to permit passage over or past it, and to automatically return to its vertical position again when such colliding ship has passed it, substantially as set forth.

4. A portable caisson provided with a shaft having air-tight doors at its top and bottom and a rope or connection from the top of the shaft to the latch of the lower door, whereby the lower door may be unlatched while the shaft and caisson are full of water to permit the water to be driven down out of the shaft by compressed air, and by which rope said lower door may be pulled shut and water prevented from returning to the air-lock when air-pressure is lowered therein, substantially as set forth.

5. A portable caisson provided with a shaft having an air-tight door at its top, a door or doors near its bottom, means for admitting compressed air into the shaft and thereby driving the water down out of the shaft, and the means for preventing the return of the water into the shaft when out by the closing of a lower door or valve, so that when the air-pressure therein is lowered the upper door can be opened and entrance be made from the top through the shaft into the air-lock, as set forth.

6. A portable caisson provided with an air-lock at its lower end, having its two air-tight doors and an additional air-tight door at the top of the shaft, whereby the water may be driven down out of the shaft and caisson by compressed air, substantially as set forth.

7. A passage-way or shaft of a diving-bell or portable caisson composed of upper and lower vertical portions, an intermediate horizontal portion, and air-lock doors at the top and bottom ends, and also an air-lock door in the intermediate horizontal portion, substantially as set forth.

8. A vertical shaft of a diving-bell or portable caisson having a horizontal section which includes the upper end of the air-lock, a door hinged to swing horizontally therein, and with a horizontal landing or terminus of the vertical portions of the shaft upon each side of said upper air-lock door M, as set forth.

9. A passage-way or shaft of a diving-bell or portable caisson having between and connecting its cylindrical end portions three connected elbows, the middle one of which lies in a horizontal plane, its two ends in vertical planes at right angles to each other and adapted to rotate or oscillate in their bearing connections with the adjacent elbows, whereby the upper portion of the shaft is free to move in any direction from a perpendicular, while the lower portion remains in vertical position, as set forth.

10. A passage-way or shaft of a diving-bell or caisson provided with a door at its top end adapted to be automatically released and closed by the rising thereto of water to prevent the water from entering the shaft, substantially as set forth.

11. An entrance-shaft of a diving-bell or caisson provided with a hinged spring-actuated door at its upper end, in combination with floats adapted to be lifted by approaching water, whereby the door is released and closed to prevent the admission of water into the shaft, substantially as set forth.

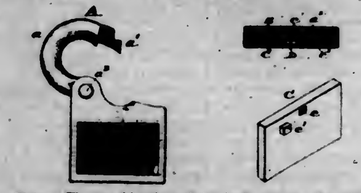
12. An entrance-shaft, H', of a caisson provided with a hinged door, *A*, having a lug or crank, A^x, spring A^2, latch-bar A^y, and catch A^3, in combination with floats A^5, levers A^7, and rods A^6, substantially as shown.

13. A diving-bell or caisson, K, having a rigid shaft, H, and a swinging portion, H', in combination with a floating buoy, B', attached thereto by a chain or cable, B^2, substantially as and for the purpose set forth.

14. A diving-bell or portable caisson having a centrally-fixed compartment adapted to hold weights or material for sinking the caisson, said compartment being tapered to a narrow edge or point at its lower end, substantially as set forth.

15. A diving-bell or portable caisson comprising an external shell, in combination with an internal central weight-receiving compartment, F, wide at its top and narrow at its bottom, substantially as set forth.

16. A diving-bell or portable caisson comprising an external metallic shell and an internal central weight-receiving compartment, F, terminating in a narrow or pointed lower end, in combination with a system of intermediate braces, E''



17. A diving-bell or portable caisson comprising an outside shell, K, a central weight-receiving compartment, F, surrounded by an annular working-chamber, E', substantially as set forth.

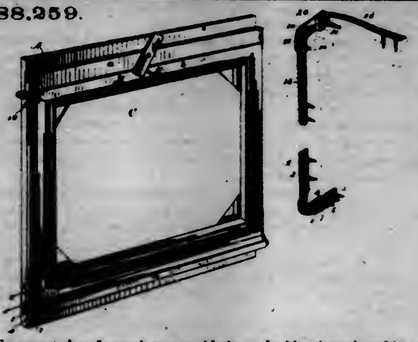
18. In combination with the shaft of a caisson, an inside ladder composed of tubular sides spaced apart and connected by rungs or rounds secured thereto to constitute the ladder, said tubular sides being adapted to convey compressed air into the caisson, and also to serve as conduits for electric-light and telephone wires, substantially as set forth.

19. A ladder within the shaft of a caisson, composed of tubular sides adapted to convey compressed air from an outside air-compressor into the interior of the caisson, in combination with electric conducting-wires inclosed within and protected by the tubular sides of said ladder and their connections, substantially as and for the purpose set forth.

20. The combination, with a caisson, of a ladder whose tubular sides are adapted to convey compressed air down the shaft of the caisson and to also serve as conduits for electric wires, and ropes for manipulating mechanism within the air-lock or caisson, substantially as set forth.

388,258. SEAL-LOCK. Lewis A. Brown, St. Louis, Mo. Filed Apr. 6, 1888. Serial No. 269,893. (Model.)

Claim.—The combination of the lock-case, the bow having the projection a', the locking-plate having the perforation *c* and the projection c', and the seal and the spring-catch D, substantially as described.



388,259. CAMERA ATTACHMENT. Frank A. Brownell, Rochester, N. Y., assignor to the Eastman Dry Plate and Film Company, same place. Filed Oct. 1, 1887. Serial No. 251,212. (No model.)

Claim.—1. The combination, in a camera, of the frame A, ground-glass frame B, and intermediate connections such as described, consisting, essentially, of a double pivoted or hinge joint, 1, on one side of the frame B and a sliding and pivoted connection, 20, on the opposite side, substantially as described.

2. In a camera attachment, the combination, with the frames A and B, of the links interposed between and pivoted to both frames on one side thereof, and links pivoted to one of said frames on the side opposite the first-named links, and provided with ways for the reception of pins on the other frame, substantially as described.

3. In combination with the frame A, provided with ways for a plate-holder, the ground glass B, adapted to enter between said ways,

388,259.

and connected to frame A on one side by a double pivoted or hinge connection, 1, and on the opposite side by pivoted links having curved grooves or ways for the reception of retaining-pins, substantially as described, whereby the frame B can be oscillated on the double-hinge connection, so as to occupy a position in rear of or against the frame A, as set forth.

4. In a camera attachment such as indicated, the combination, with the frame A, of the frame B, carrying arms 2, and links 3, the latter pivoted to said arms and to the frame A at a point intermediate the positions occupied by the pivots connecting links 3 and arms 2 when the latter are at the extremes of their movement, substantially as described.

5. In combination with frames A and B and the interposed pivoted links 3, the slotted and pivoted links 10, and the pins engaging said slotted links, substantially as described.

6. In combination with the frame A and its ribs or ways *a*, the frame B, adapted to enter between said ribs and connected to the frame A by pivoted links 3 on one side, and a detachable connection on the opposite side, substantially as described.

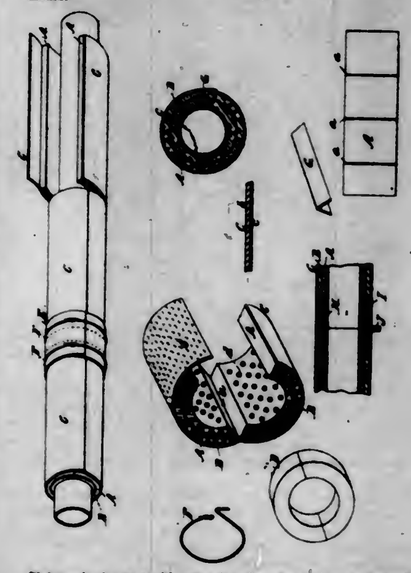
7. In combination with the frame A, the adjustable frame B, carrying inwardly-projecting arms 2 on one side and at opposite ends thereof, and links 3, pivotally attached to said arms and to the frame A, and provided with a stop to limit the outward or downward movement of said links, substantially as described.

8. In a camera attachment such as described, and in combination with the frame attached on one side to the frame A by a movable or adjustable connection, the links 10, pivotally connected at one end to the frame A and provided with downwardly or inwardly slotted portions, and pins mounted upon the frame B and engaging said slotted portions of the links 10, substantially as and for the purpose set forth.

9. In a camera attachment such as described, and in combination with the frame B, attached at the lower side to the frame A by a hinge or pivoted connection which will permit said lower side to be adjusted toward and from the frame A, the slotted folding links 10, and the detachable pins on frame B, engaging said links, substantially as described, to sustain the upper side of the frame B in adjusted position and permit it to be detached and swung back, as set forth.

10. In a camera attachment such as described, the combination of the frame B, provided with pins 12 on the ends of one side and arms 2 on the opposite side, links 3, pivoted to arms 2 and the frame A, and links 10, pivoted to the frame A and provided with slotted portions 11 for the reception of pins 12, substantially as described.

11. In combination with the frame B, attached to frame A by a double connection, 1, and provided with pins 12, the slotted and pivoted links or arms 10, provided with angular bearing-blocks, and the springs resting upon or bearing against said bearing-blocks, substantially as described.



12. In a camera attachment such as described, and in combination with the pivoted arm or link 10, slotted for the reception of a pin, 12, on a movable frame, the angular bearings applied to or formed on said arm, and a spring engaging said bearings to retain said arm in adjusted position, substantially as described.

13. In a camera attachment such as described, and in combination with the frame B, connected on the lower side to the frame A, as described, to permit said lower side to be adjusted toward and away from frame A, the spring-plate mounted in the frame B and carrying pins for engaging links or supports connected to frame A, substantially as described.

14. The combination, with the frame A, of the camera-box provided with ways or supports for the plate-holder, a ground-glass frame connected at opposite sides to the frame A, so as to swing behind and parallel with the rear face of frame A or against the latter, and a spring or elastic pressure device, S, attached to and carried by the said ground-glass frame and adapted to engage the plate-holder, substantially as described.

15. The combination, in a camera and with frame A and its ways or supports for the plate-holder and a ground-glass frame supported upon frame A, and adapted, through its connections therewith, to be swung between the said ways or supports or in rear of and parallel therewith, of the springs S, projecting from the inner face of the ground-glass frame to bear against the plate-holder, said springs being adapted to enter the opening in frame A when the ground-glass frame is closed, substantially as described.

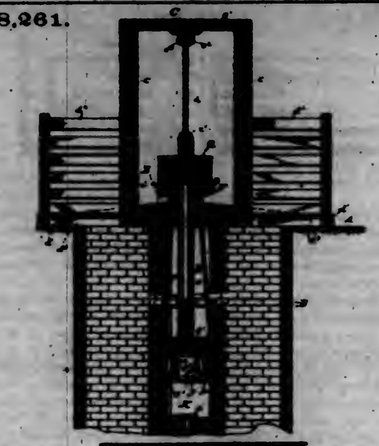
388,260. COVERING FOR STEAM PIPES AND BOILERS. PHILIP CAREY, Cincinnati, Ohio. Filed Apr. 30, 1888. Serial No. 272,332. (No model.)

Claim.—1. A removable covering for steam-pipes and the like, composed of a porous fire-proof composition saturated with still-wax and made into hinged sections united around the pipe, substantially as and for the purpose specified.

2. In a removable covering for steam-pipes and the like, the semi-cylindrical portions of porous fire-proof composition having embedded therein sheets of wire-netting, and saturated with still-wax, substantially as and for the purpose specified.

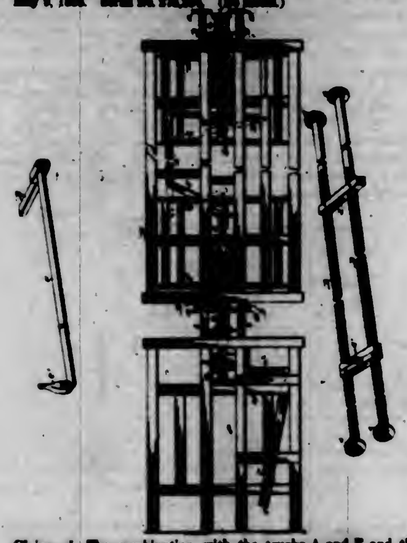
3. The herein-described removable covering for steam-pipes and the like, composed of the porous fire-proof sections A, into which wire-netting B is embedded, united by hinge-strings *a*, and the corrugated enveloping-paper C, lined with canvas at its lap, and which said sections are saturated with still-wax, substantially as and for the purpose specified.

4. The combination, with the portions A and enveloping material, C, of the heat-retaining strip G, applied at the joint, substantially as described.



5. The combination with the abutting sections of a removable covering, of interposed elastic wings, and the enveloping-strip covering the joint and held in place by the wire ties, substantially as described.

6. The combination, with a pipe or steam-chamber and its non-conducting covering, of a drain-cup within the covering, provided with an escape-tube passed through an opening in the covering, substantially as and for the purpose specified.



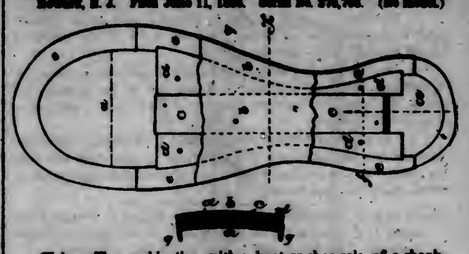
388,261. AUTOMATIC WATER-ELEVATOR. FRANK J. CARR, Arrington, Kans. Filed Aug. 13, 1887. Serial No. 246,806. (No model.)

Claim.—In an automatic water-elevator, the combination, with the hinged platform having the trough secured thereon, and the discharge-tube, of the piston J, having the downwardly-opening valves *j j*, the leather band surrounding said piston, the curved bars j^3 between the piston and leather, and the flat springs j^3, secured at their upper ends to the piston and at their lower ends to the bars j^3, substantially as specified.

388,261.

388,262. CAR-BRAKE. JAMES J. CARTER, Moberly, Mo. Filed May 9, 1888. Serial No. 273,324. (No model.)

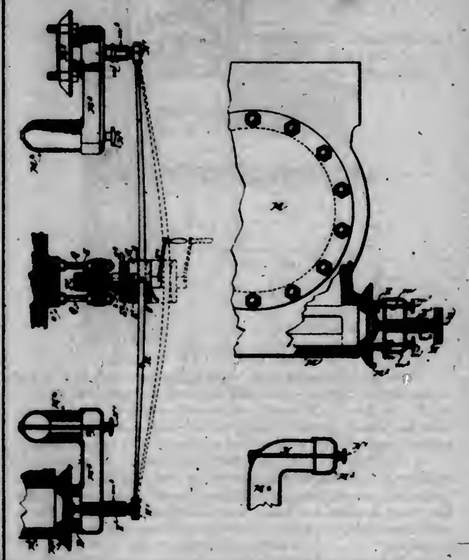
Claim.—1. The combination, with the trucks A and B and the sliding bars D on the truck B, for actuating the brakes, of the sliding draw-bar *a*, the movable block E, and the push-bars *b*, substantially as and for the purpose described.



2. The combination, with the trucks A and B and the sliding bars D on the truck B, adapted to have connection with the brakes, of the sliding draw-bar *a*, the push-bars *b*, the block E, the horizontal lever C, and the vertical lever C', extending within convenient reach of the engineer, substantially as and for the purpose described.

3. The combination, with the truck, the lever *g*, connected with the brake-bars, and the sliding bars D, having the stop *d'*, of the lever H, the rod I, and the lever J, substantially as and for the purpose described.

4. The combination, with the car-trunk, the lever *g*, connected with the brake-bars, and the sliding bars having the stops *d* and *d'*, of the lever H, the rod I, and the lever J, substantially as and for the purpose specified.



5. The combination, with the truck A, the sliding draw-bar *a*, the movable block E, and the push-bars *b*, of the truck B, the sliding bars D, extending from one end to the other of the truck and having the stops *d* and *d'*, the springs K, for holding the bars D in a normal position, the brake-bars, the rods, and the lever *g*, connecting the brake-bars, the lever H, the rod I, and the lever J, substantially as and for the purpose set forth.

388,263. SHANK FOR BOOTS OR SHOES. CHARLES GOODYEAR, Newark, N. J. Filed June 11, 1888. Serial No. 276,703. (No model.)

Claim.—The combination, with a boot or shoe sole, of a shank-stiffener formed of one piece of Malacca wood secured to said sole, longitudinal holding-pieces secured to the inner sole for holding said shank-stiffener laterally, and a cross-piece attached to the sole for holding said stiffener longitudinally, substantially as and for the purposes set forth.

388,264. CYLINDER RELIEF-VALVE. GEORGE H. CORLISS, Providence, R. I.; Emily A. Corliss administratrix of said George H. Corliss, deceased. Filed Feb. 4, 1888. Serial No. 262,973. (No model.)

Claim.—1. The combination, with the exhaust-valve bonnet M^3, of a relief-valve, E, and means for holding it with yielding force, said relief-valve being arranged and adapted to open outward from the exhaust-valve bonnet against the force of the controlling means.

2. In combination with an exhaust-valve box, a bonnet, M^3, valve E, and means, as a weight or spring, for holding said valve upon its seat with yielding force, said valve being adapted to open outward from said exhaust-valve box against the force of said controlling means.

3. The valve E, operating means H, bonnet M^3, and discharge-pipe M^5, combined with each other and with the exhaust-valve box M' of a steam-engine, all arranged and adapted to serve as and for the purpose specified.

4. The valve E, valve-stem F, bonnet M^3, and pipe M^5, provided with a sleeve, m^2, combined with each other and with means H for applying a yielding force upon said valve-stem to hold the valve upon its seat, all substantially as herein specified.

5. In a cylinder-relief, the combination, with the two exhaust-valve bonnets and two relief-valves and relief-valve stems, of a spring centrally supported and adapted to exert equal pressure upon the two valve-stems on the same side of the cylinder, all substantially as herein specified.

6. The elliptical spring H, clasp G, shoes H' H', valves E E, and valve-stems F F, combined with each other and with means S for de-

pressing said spring to apply pressure to said valve-stems, all substantially as herein specified.

7. The clasp G, screw S, gear S^2, pinion T, and crank T, combined with each other, as shown, and with a nut, P, the whole arranged and adapted to serve as specified.

8. The bracket P, provided with a nut, P, and ears on either side of said nut, combined with rods Q Q, cylinder M, and cylinder side flange, M^6, adapted to serve for a support for the clasp G, and spring H, as herein specified.

9. The bonnet M^2, relief-valve E, means H for holding with yielding force, and discharge-pipe M^4, combined with each other and with the stud-bolts *m m* and hand-nuts *m'* to form a steam-tight joint, all substantially as herein specified.

388,265. STEAM-ENGINE VALVE. GEORGE H. CORLISS, Providence, R. I.; Emily A. Corliss administratrix of said George H. Corliss, deceased. Filed Feb. 4, 1886. Serial No. 262,060. (No model.)

Claim.—1. The valve A, provided with cylindrical ends A' A' and an opening, A^3, through one of said ends, in combination with the bonnet M^2 and the valve E, opening outward from said valve, so as to promote the passage of fluid outward to relieve the cylinder from undue pressure and to forbid its return, all substantially as herein specified.

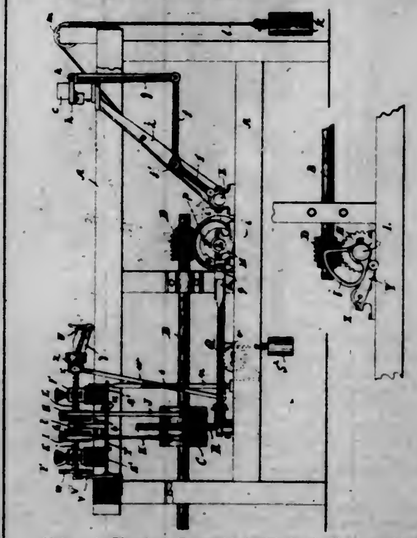
2. The valve A, provided with an axial passage, A^3, and centrally located rib *a*, combined with a spring, B, extending through and beyond the valve and being journaled at each end outside and independently of said valve, and having a central bearing against said rib *a* and at no other point within said valve, all arranged and operating as specified.

3. The valve A, provided with an axial passage, A^3, and central rib or bearing, *a*, and a spring, B, extending through and beyond said valve, as shown and described, combined with each other and with a valve-stem, C, and bonnet M^2, whereby said spring is journaled at each end entirely outside of and independently of said valve and taken as a bearing only at the center of said valve against said rib *a* to hold the valve upon its seat.

4. The valve-stem C, axially bored, as shown, combined with the valve A and with a spring, B, and adapted to serve, as specified, as a bearing for end of said spring.

388,266. CONSTRUCTION OF PERMANENT WAYS. GEORGE COWDERY and ERWIN R. THOMAS, Burwood, near Sydney, New South Wales. Filed Aug. 10, 1886. Serial No. 211,309. (No model.) Patented in England June 30, 1886, No. 8,902.

Claim.—1. The combination, with a railroad-rail, of a metal sleeper or cross-tie, having upwardly-extending and inturned lugs to engage the base of the rail, an inclined or tapering bed-piece slotted



to receive the adjacent rail-gripping lug or lugs, an anti-creeping pin passed vertically through the base of the rail and the bed-piece, and a split key to lock said pin and the adjacent portion of the base of the rail, the bed-piece, and the adjacent clip together, substantially as set forth.

2. As an improvement in the permanent way of railroads, the combination of a railroad-rail of substantially T form in cross-section and having a vertical slot or hole in one base, a sleeper or cross-tie having downturned edges, a pair of oppositely-facing lugs or clips integral with said sleeper or tie and extending upwardly therefrom and having inturned top portions, a horizontally tapering or inclined bed-piece to support the rail in horizontally-inclined position, said bed-piece being slotted or recessed at each end to receive and embrace and grip the lugs or clips on the tie, and having near one end a vertical slot or hole therethrough, an anti-creeping pin passed through said vertical holes in the base of the rail and in the bed-piece, respectively, and having a beveled head, and a split key adapted to grip the rail, bed-piece, and adjacent clip together and having a beveled under face or side to grip the anti-creeping pin, substantially as set forth.

388,267. YARN-HANKING MACHINE. JOSEPH DART, Brooklyn, N. Y., and WILLARD I. LEWIS, Walpole, Mass.; said Lewis assignor to said Dart. Filed July 2, 1887. Serial No. 243,264. (No model.)

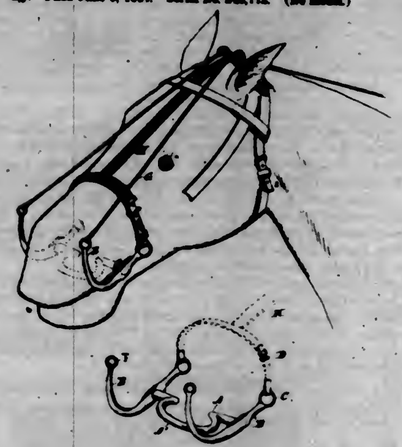
Brief.—The object of the invention is to produce a machine for twisting and hanking skeins of yarn by imparting a certain number of revolutions to one end of the skein while the other end is held stationary, and then causing the two ends to be brought together, so that one end can be passed through the other.

Claim.—1. The shaft E, provided with hook U, in combination with the double friction-flange G, pulleys H and I, belts J and K, pulley C on the driving-shaft B, the pawl V, and flange W, provided with a projection, V', substantially as and for the purposes set forth.

2. The combination of the shaft B, worm D, worm-wheel N, shaft L, double cam P, lever Q, provided with pin *q*, rock-or-shaft R, spring-lever S, double friction-flange G, weight S^5, arm *r*, shaft E, and pulleys H I, substantially as and for the purposes set forth.

3. The lever Z, provided with the box or form *c*, shaft X, and crank Y, in combination with the cam *j* on shaft L, substantially as and for the purpose set forth.

4. The bell-crank *f*, lever or rod *g*, and slide A, in combination

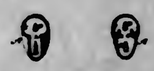


with the lever Z; box or form *c*, and cam *i* on shaft L, substantially as and for the purpose set forth.

5. The combination of the cam *u* on shaft L, the rods or levers *v w*, shaft E, sliding sleeve *x*, connecting-rod *y*, and the hook U, substantially as and for the purpose set forth.

6. In a twisting and hanking machine, the combination of the shaft B, having pulley C, the shaft E, having a double friction-flange, G, feathered thereon, the pulleys H and I, loosely mounted on the shaft E, the belts J K, the hook U, mounted upon the end of the shaft E, and means, substantially as specified, to engage either of the pulleys with the flange G, substantially as described.

7. In a twisting and hanking machine, the combination of the rotary shaft E, the hook U, mounted on said shaft and adapted to carry one end of the skein of yarn or warp, a hollow form or box, *c*, adapted to carry the other end of the yarn, a lever upon which said box is mounted, and means, substantially as specified, for automatically rotating said lever to cause the box *c* to advance and pass over the hook U, substantially as described.



388,268. OVERCHECK BRIDLE-BIT. GUY DAVIS, Harrodsburg, Ky. Filed June 9, 1887. Serial No. 240,772. (No model.)

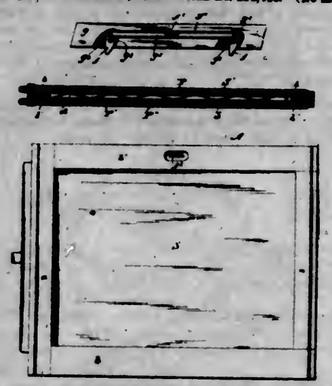
Claim.—1. An overcheck-bit having side bars, B, with forwardly-projecting arms E, and overchecks G, attached to the forward ends of said arms, and the muzzle-strap D, attached to the upper part of the bit, and the face-strap H, substantially as herein set forth.

2. The combination of the bit A, having the downturned part A', the forwardly-disposed arms E, and overchecks G, with the muzzle-strap D and face-straps H, substantially as herein set forth.

388,269. ARTIFICIAL TOOTH. ABNER W. DAY and LEWIS A. ROGERS, Grand Rapids, Mich. Filed Feb. 21, 1888. Serial No. 264,869. (Model.)

Claim.—A metallic shell, A, which conforms to the shape of the lingual side of the tooth, and is provided with the headed pins D and the turned-in parts which catch in the teeth, in combination with the artificial tooth, which is formed while soft upon the shell and then baked, so as to make them practically one, substantially as shown.

388,270. MUSIC-HOLDER. GOTTLIEB DUNNEBERG, Hamilton, Miss. Filed Apr. 21, 1888. Serial No. 271,209. (No model.)



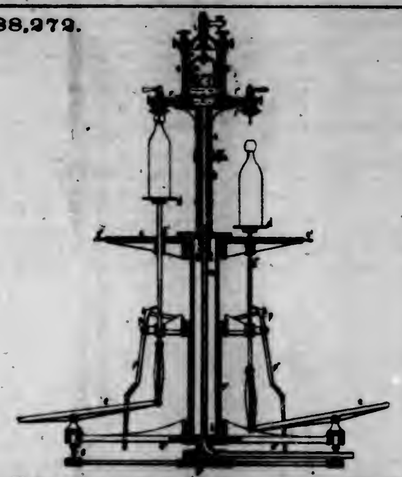
Claim.—The combination of the supporting-board provided with a groove which extends from one end to the other, and keepers which project across the top of the groove, with the two slides which are placed side by side in the same groove, and which overlap each other at their inner ends, and the holding devices applied to the outer end of each one of the slides, substantially as shown and described.

388,270.

388,271. PHOTOGRAPHIC-PLATE HOLDER. GEORGE EASTMAN, Rochester, N. Y., assignor to the Rochester Dry Plate and Film Company, same place. Filed Oct. 1, 1887. Serial No. 251,213. (No model.)

Claim.—1. In a plate-holder such as described, and in combination with its grooved and flanged side bars, movable dogs or clamps supported upon the flanged side bar and devices connecting said dogs for simultaneously projecting them over the edge of the plate or withdrawing them at will, substantially as described.

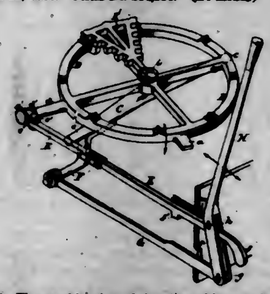
2. A plate-holder such as described, consisting, essentially, of an open frame composed of end and side pieces grooved near opposite faces for the accommodation of slides or shutters, one of said side bars being provided with a longitudinal groove intermediate the two shutters, and the other with a flange and co-operating plate-holding dogs, substantially as described.



3. The combination, in a plate-holder such as described, and with the side bars, the one grooved and the other provided with a shoulder or flange and locking-dogs, of the plates and interposed elastic cushion or pad, the whole resting at one edge in the groove of one side bar and at the opposite edge between the flange and dogs on the other side bar, substantially as and for the purpose set forth.

4. In a plate-holder such as described, the combination, with the recessed side bar, of the pivoted dogs and connecting-bar and the covering strip or plate, substantially as described.

5. In a plate-holder such as described, the combination, with the recessed side bar provided with a shoulder or flange to receive the edge of the plate, of the dogs pivotally supported in the recesses, the connecting-bar with thumb-piece or handle, and the top or outer section applied to the side bar to cover the dogs and form a groove or way for the exposing-slide, substantially as described.

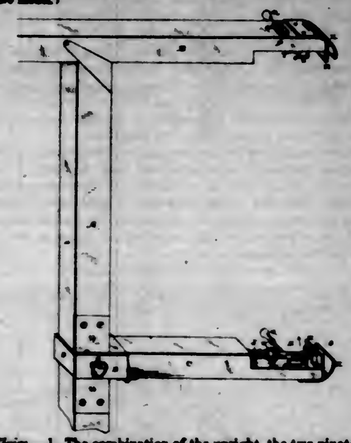


388,272. BOTTLING AND CASK-FILLING APPARATUS. LUDWIG A. ROSSKOPF, Worms, Hesse, Germany. Filed July 13, 1887. Serial No. 244,161. (No model.)

388,272.

Claim.—In apparatus for filling bottles, casks, barrels, or other like receptacles with gaseous liquids, the combination of a vessel or chamber, *c*, with supply-pipe *a* and air-passage *l*, having a valve therein, a float connected to said valve, a tap or cock, *f*, with plug *h*, having the perforations *h'* and *h²*, passage *f'*, leading from the bottom of the vessel *c* to the perforation *h'*, and passage *f² g f*, connecting the top of the said vessel with the perforation *h²*, substantially as and for the purpose described.

388,273. FURNACE-GRATE. Stephen J. Gavin, Philadelphia, Pa., assignor to Stephen Morris and Edward W. Morris, both of same place. Filed Sept. 26, 1888. Serial No. 214,980. (No model.)



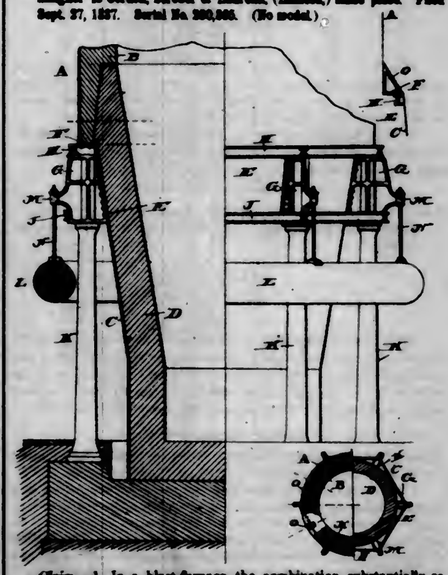
Claim.—1. The combination of the pivoted hanger-bar, the grate-frame pivoted thereto, and a retainer to prevent the dumping of the grate, with a shaker-rod connected to said grate-frame and projecting through an opening in the front plate or casing of the furnace, said rod having a stop-lug whereby movement of the rod is arrested before the grate has been vibrated to such an extent as to free it from the control of the retainer which prevents the dumping of the grate, all substantially as specified.

2. The combination of the pivoted hanger-bar and its crank, a grate pivoted to said bar, a retainer for preventing the dumping of the grate, a shaker-rod connected to the grate-frame and having a stop-lug to restrict its movement, a dumping-lever, and a rod connecting said lever to the crank of the hanger-bar, all substantially as specified.

3. The combination of the pivoted hanger-bar and its crank, a grate pivoted to said bar, a retainer to prevent the dumping of the grate, a shaker-rod, E, connected to said grate and serving as a means of vibrating the same, a stop to limit the movement of said rod, a rod, G, connected to the crank of the hanger-bar, and a lever connected to both of said rods E and G, all substantially as specified.

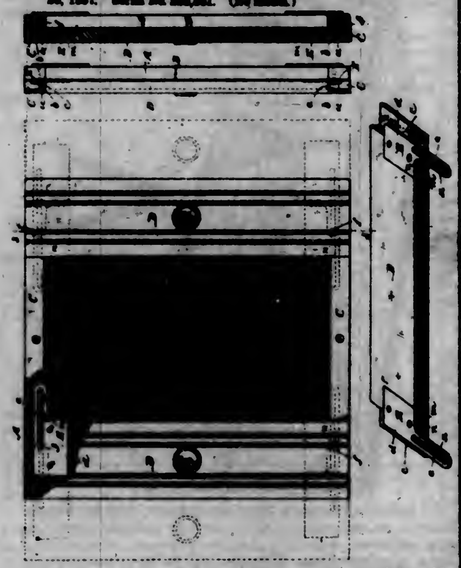
4. The combination of the pivoted hanger-bar and its crank, a grate hung to said bar, a retainer for preventing the dumping of the grate, a dumping-lever and rod, the rod E, connected to the grate-frame and having a stop-lug, and a slot-and-pin connection between said rod E and the dumping-lever, whereby the stop-lug of the rod may be freed and further movement of said rod permitted, all substantially as specified.

388,274. HAIR-BAG CATCHER. Joseph H. Gallehue and William P. Dorman, Marion, Va. Filed Feb. 28, 1888. Serial No. 265,977. (No model.)



Claim.—1. The combination of the upright, the two pivoted arms connected thereto, the notched spring-actuated rods H, provided with handles Q, the guides through which the rods pass, and the keepers Y Z, between which the handles catch, substantially as shown.

2. The combination of the pivoted arms and the spring-actuated endwise-moving rods H, provided with shoulders, with suitable guides, through which the rods pass, the outer ends of the rods being given a slight lateral play in their guides, so as to disengage the shoulders from the guides, substantially as described.

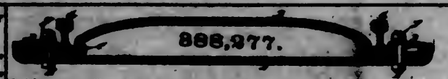


3. The combination of the pivoted arms, the spring-actuated rods H, provided with handles J and shoulder L, and the guides through which the rods move, the rods being adapted both to have a turning movement in their guides, so as to turn the shoulder in the direction of the advancing train, and having a slight lateral play at their outer ends in the angular guides, substantially as set forth.

388,275. BLAST-FURNACE. Peter W. Gennet, Philadelphia, Pa., assignor to Gordon, Strobel & Laureau, (Limited,) same place. Filed Sept. 27, 1887. Serial No. 250,955. (No model.)

Claim.—1. In a blast-furnace, the combination, substantially as set forth, of a bosh-shell, a stack-shell of greater diameter than the bosh-shell, a horizontal mantel joining the top of the bosh-shell and the bottom of the stack-shell, brackets G, engaging the mantel and bosh-shell, straight beams H, engaging under the mantel tangent to the bosh-shell and connected at their ends to said brackets, columns K, isolated from the bosh-shell and with their upper ends engaging the brackets directly below the mantel, and beams J, extending from bracket to bracket and secured thereto at the front beam of said brackets.

388,276. EXTENSION-CURTAIN. Edwin L. Gray, Burlington, Vt., assignor to the Porter Manufacturing Company, same place. Filed Jan. 20, 1887. Serial No. 225,221. (No model.)



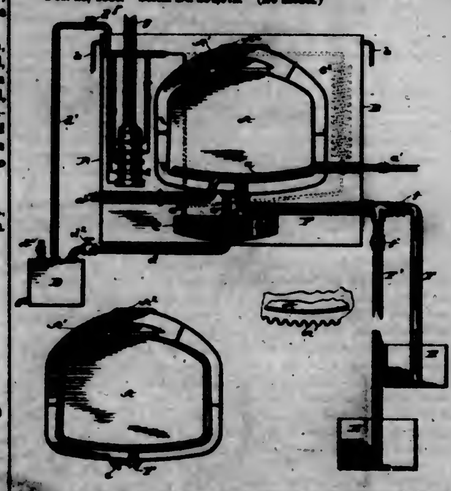
Claim.—1. The combination, with the screen-frame and the guide-rails C, provided with tongues and grooves on their interior opposite edges, as described, of the sliding extension-strips D, overlapping the guide-rails externally and formed on their inner faces with guide-recesses, the slotted metal plates E, secured to the inner faces of said strips, so that their upper longitudinal edges shall project above the bottom of said guide-recesses to form guide-tongues which bound said recesses on one side, and the stop pins or studs secured to the screen-frame and extending crosswise through the slots in said plates, as and for the purposes hereinbefore set forth.

2. The slotted metal guide-plates E, formed with shoulders a, in combination with the recessed extension-strips D, the guide-rails C, the screen-frame, and the stop-pins, these parts being constructed and arranged for joint operation as hereinbefore set forth.

388,277. METALLIC RAILWAY-TIE. Andrew J. Hampson, New York, N. Y., assignor to Maunsell and Edward H. Patterson, Jr., same place. Filed Jan. 16, 1888. Serial No. 260,893. (No model.)

Claim.—1. A metallic railway-tie which consists of a metallic tie-

388,277.



bridge extending from rail to rail and bent upward to prevent the approach of the rails to each other, and provided with a lip beyond the rails to prevent their outward movement, substantially as described.

2. The tie-bridge B, bent at C, and again bent at D, thereby locking the rail between the bends of the tie, substantially as described.

3. The combination of the tie-bridge B, bent at C and D, and the bolt H, substantially as described.

4. The combination of the tie A, tie-bridge B, and rail G, locked thereto, substantially as described.

388,278. DISTILLING APPARATUS. William L. Hoxie, Hartford, assignor to the Hoxie Vacuum Company, Hartford, Conn. Filed Feb. 28, 1888. Serial No. 265,672. (No model.)

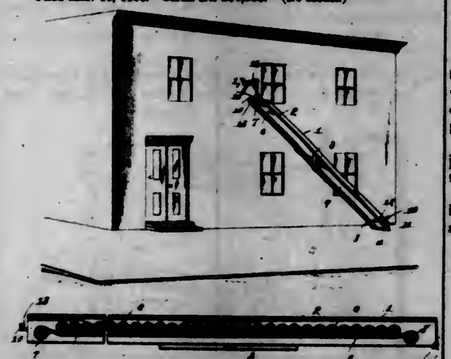
Claim.—1. The herein-described still and condenser, consisting of two receptacles, one within the other, the still being within the condenser, and the two located within a third receptacle containing a cooling medium for the condenser.

2. The combination, with a condenser and a liquid-cooling tank surrounding the same, of a liquid vacuum-pump connected with said condenser and discharging into the cooling-tank of the condenser, substantially as described.

3. The herein-described still and condenser, consisting of two receptacles, the former being located within the latter, the discharge from the condenser being at the lowest point of the same, the still opening into the condenser at the top, and the space between the two gradually decreasing toward the condenser-discharge, substantially as described.

4. The herein-described still and condenser, consisting of two receptacles, said still being located within the condenser and having its walls composed of two thicknesses of material with an air-space between them, substantially as described.

5. The combination, with a vacuum-still, condenser, and tank containing a cooling medium in which the condenser is located, of an air-pump and a tortuous passage within said tank between the condenser and air-pump, substantially as described.



6. The combination, with a still and condenser consisting of two receptacles, one within the other, the still being located within the condenser and opening into the same, of a tank containing a cooling-liquid for said condenser, a receptacle, also within said tank, containing a helical partition, the said condenser being connected with the said receptacle near the inner end of said partition, and an air-pump connected with said receptacle near the outer end of said partition, substantially as described.

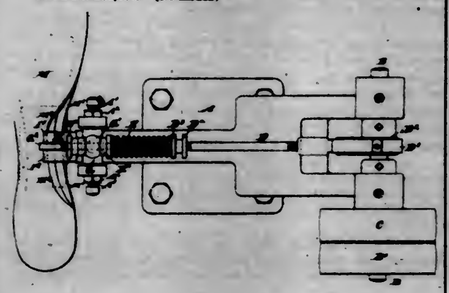
7. The combination, with a still and condenser, of a receptacle containing a tortuous passage connected with said condenser, a tank in which said receptacle is located, and a liquid air-pump connected with said receptacle and discharging into said tank, substantially as described.

8. The combination, with a still and condenser, of a tank surrounding said condenser, and a liquid air-pump connected with said condenser and discharging into said tank, substantially as described.

9. The combination, with a still and condenser consisting of two receptacles, the still being located within the condenser and discharging into the condenser at the top, and the condenser discharging at the bottom, the space between the two receptacles gradually decreasing toward the condenser-discharge, of a liquid-cooling tank surrounding the condenser and a liquid air-pump connected with the condenser and discharging within the tank, substantially as described.

388,279. FIRE-ESCAPE. William H. Howard, Houston, Tex. Filed Mar. 16, 1888. Serial No. 267,262. (No model.)

Claim.—1. In a fire-escape, the combination of a chute formed of two side rails and transversely-journaled anti-friction rollers forming the bottom of the chute, with a brake-strap bearing against the rear sides of the rollers and having means for tightening it against them, as shown, and for the purposes specified.



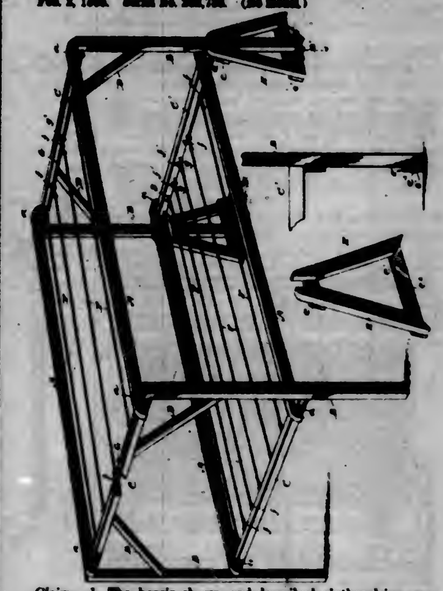
2. In a fire-escape, the combination of two side rails having hand-rails or moldings upon the forward edges, anti-friction rollers journaled transversely between the side rails, forming the bottom of the chute, rollers journaled transversely in the top and bottom of the chute, and a brake-strap secured with its ends to the rollers bearing against the rear sides of the anti-friction rollers and winding upon the lower roller, as shown, and for the purposes specified.

3. In a fire-escape, the combination of a chute having anti-friction rollers journaled transversely to form a bottom, and having a strap or bail at the upper end formed with a central loop, and a bracket or arm having a four-pronged swiveled hook in its outer end, as shown, and for the purposes specified.

4. In a fire-escape, the combination of an arm or bracket having a four-pronged swiveled hook at its outer end, and a chute having a strap or bail at its upper end formed with a central loop engaging the prongs of the hook, and having a transverse foot-rail provided with spikes for entering the ground, as shown, and for the purposes specified.

5. In a chute fire-escape, the combination of side rails having the rear edges connected by cross-braces and having molded hand-rails upon the forward edges, anti-friction rollers journaled transversely between the rails to form the bottom of the chute, a roller journaled in the upper end of the chute, a roller journaled transversely in the lower end of the chute and having a ratchet-wheel and pawl and a crank, and a brake-strap secured to the rollers at the ends of the chute and bearing against the rear sides of the anti-friction rollers and winding adjustably upon the lower roller, as shown, and for the purposes specified.

388,280. MACHINE FOR TURNING THE CHANNEL-LIPS OF INSOLES. Samuel H. Howland, New York, N. Y. Filed Jan. 24, 1888. Serial No. 261,737. (No model.)



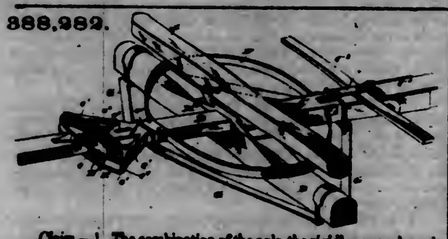
388,280.

Claim.—1. In a machine for turning the channel-lips of insoles the beveled guide I' and table J', in combination with each other and with the jaw G', reciprocated relatively to the table, adapted to turn over and press down the lip of an insole, substantially as and for the purposes herein specified.

2. In combination with the guide I', table J', and reciprocating jaw G', the spring E, eccentric F', and rod D, arranged to operate the jaw with a yielding force, as herein specified.

3. The duplicate guides I' I', in combination with the reciprocating jaw G', table J', and means, K, for adjusting the guides and table, arranged to serve substantially as herein specified.

388,281. CLOTHES-DRIER. John R. Jefferis, Salem, Ill. Filed Feb. 2, 1888. Serial No. 262,702. (No model.)

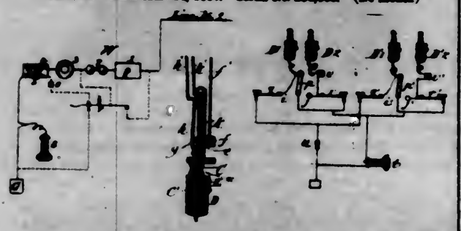


Claim.—1. The herein shown and described clothes-drier, composed of the end sections having posts and upper and lower cross-bars, and having brace-bars D, the upper and the lower side bars having their ends fitted to the upper and the lower cross-bars, the line-supporting rods secured to the cross-bars, the lines extending from one end section to the other and having hooks at their ends, which are adapted to catch over and slide on the said rods, and the truss-stands composed of the two oppositely-inclined legs E and the upper and the lower cross-bars, the upper cross-bar, *c*, coming under the end cross-bar, C, and the lower cross-bar, *c'*, resting against the end of the post B and held thereto by an interlocking-pin, substantially as set forth.

2. The combination, with the end section having a post and cross-bar, of the truss-stand composed of two oppositely-inclined legs, the upper ends of the legs being separated and embracing the sides of the post, an upper cross-bar uniting the legs near their upper ends and bearing against the under side of the cross-bar, and the lower cross-bar uniting the lower ends of the legs and resting against the post, and the interlocking-pin connecting the post and the lower cross-bar substantially as and for the purposes described.

388,282. RUNNING-GEAR FOR WAGONS. Hiram Kibbe and James Lamberson, Gouverneur, N. Y. Filed Feb. 20, 1888. Serial No. 264,993. (No model.)

388,282.



Claim.—1. The combination of the axle, the rigidly-secured reach-beam B and tongue-beam C, projecting at opposite sides of the axle, the bolster, the blocks H and H', arranged and operating as described, and the semicircular bars F, secured at their front and rear ends to the opposite sides of the tongue-beam and reach, respectively, to form guides or supports for the outer ends of the bolster, substantially as set forth.

2. The combination, with the axle-beam D, of the sectional reach-bar, the plates *c'*, the laterally-extended slotted circular plates E', having forward extensions, *e'*, with the slots *f'* therein, the inner steel pins passing through one of the sections of the reach-bar and engaging with the slots *e'*, and the pin or stud *d'*, carrying rollers on its upper and lower end engaging with the slotted portion of the said circle-plates E' and with the indentations *c'* in the slots of said circle-plates, substantially as described.

3. The combination, with the axle-beam D, of the tongue-beam C, the bolster A, the blocks H and H', and the braces G and F, arranged and connected to said parts, as set forth.

4. The combination, substantially as described, of the tongue C, provided with side plates having circular openings, the tongue-beam C, having side plates provided on their inner faces with circular bosses to fit the openings in the side plates of the tongue, and the securing-bolt passing through the axial center of the said circular bosses.

388,283. MULTIPLE SWITCH-BOARD. Silas G. Kellogg, Hyde Park, Ill. Filed Mar. 14, 1887. Serial No. 230,933. (No model.)

Claim.—1. In a telephone-subscriber's station outfit, the combination of a battery-transmitter, a battery, and a switch, said switch having a pair of contact-points which are closed when the switch is in position for the telephone to be used, and not otherwise, the transmitter being in the circuit of the line and being shunted by a branch or derived circuit, in which are said battery and said pair of contact-points, substantially as set forth.

2. In a telephone-subscriber's station outfit, the combination of a resistance, (of whatever kind,) a battery, and a switch, said switch having a pair of contact-points which are closed when the switch is in position for the telephone to be used, and not otherwise, the resistance being in the circuit of the line, and being shunted by a branch or derived circuit in which are said battery and said pair of contact-points, substantially as set forth.

3. In a telephone-subscriber's station outfit, a battery-transmitter and the primary of its induction-coil in the circuit of the line, a switch having a pair of contact-points, and a battery, said battery and said pair of contact-points being in a branch or derived circuit which shunts said transmitter and primary of its induction-coil, and said pair of contact-points being closed when the switch is in position for the telephone to be used, and not otherwise, substantially as set forth.

4. In a telephone-exchange system, a telephone-line grounded at its outer end, a battery-transmitter with the primary of its induction-coil, a battery, and a switch at the subscriber's station, said switch having a pair of contact-points which are closed when the switch is in position for the telephone to be used, and not otherwise, said transmitter, with its induction-coil, being in the circuit of the line, and said battery and said pair of contact-points being in a branch or derived circuit which shunts said transmitter with its primary of the induction-coil, in combination with a test-receiving instrument at the central office grounded on one side, and a switch-testing plug or device connected to said instrument on its other side, whereby an operator may at will connect it to the circuit of said line, substantially as set forth.

5. In a telephone-exchange system, a telephone-line grounded at its outer end, a resistance, (of whatever kind,) a battery, and a switch at the subscriber's station, said resistance being in the circuit of the line, said switch having a pair of contact-points which are closed when the switch is in position for the telephone to be used, and not otherwise, and said battery and said pair of contact-points being in a branch or derived circuit which shunts said resistance, in combination with a test-receiving instrument grounded on one side, and a switch-testing plug or device connected to said instrument on its other side, whereby an operator may at will connect it to the circuit of said line, substantially as set forth.

6. In a telephone-exchange system, the combination of a telephone-line grounded at its outer end, two or more switch-boards, at either of which said line may be switched for conversation, and test-receiving instruments, one at each board, each instrument being grounded on one side and connected on its other side to a switch-testing plug or device to connect it for testing with the circuit of the line, with a resistance, (of whatever kind,) a battery, and a switch at the subscriber's station, said resistance being in the circuit of the line, said switch having a pair of contact-points which are closed when the switch is in position for the telephone to be used, and not otherwise, said battery and said pair of contact-points being in a branch or derived circuit which shunts said resistance, substantially as set forth.

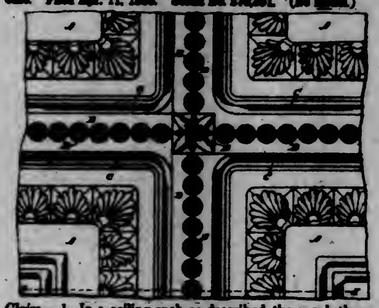
7. In a telephone-exchange system, two telephone-lines grounded at their outer ends and connected together at the exchange-office for conversation, a battery, and a switch at the subscriber's station at each line, each switch sending a current to line from its battery when the switch is in position for the telephone to be used, and not otherwise, and said batteries being so connected that their currents go in opposite directions through the circuit, in combination with a test-receiving instrument at the central office grounded on one side, and a switch-testing plug or device connected to the other side of said instrument, whereby an operator may at will connect it to the circuit of either line, substantially as set forth.

8. In a telephone-exchange system, two or more switch-boards, at either of which the same lines may be switched for conversation, two lines temporarily connected together at one of said boards, a battery, and a switch at the subscriber's station of each line, each switch sending a current to line from its battery when the switch is in position for the telephone to be used, and not otherwise, and said batteries being connected so that their currents go in opposite directions through the circuit, in combination with test-receiving instruments, one at each board, each instrument being grounded on one side and connected on its other side to a switch-testing plug or device, whereby an operator may at will connect it to the circuit of either line, substantially as set forth.

9. In a telephone-exchange system, two telephone-lines grounded at their outer ends and connected together at the central office for conversation, a clearing-out commutator in the circuit of said lines at the central office, a battery, and a switch at the subscriber's station of each line, each switch sending a current to line from its battery when the switch is in position for the telephone to be used, and not otherwise, and said batteries being so connected that their currents go in opposite directions through the circuit, in combination with a test-receiving instrument at the central office grounded on one side, and a switch-testing plug or device connected to the other side of said instrument, whereby an operator may at will connect it to the circuit of either line, substantially as set forth.

10. In a telephone-exchange system, a pair of central-office cords with plugs adapted for use with the line-switches, in combination with an operator's telephone and a switch, said cords being normally, or when not in use for conversation between two subscribers, disconnected from each other, and one of them grounded through the operator's telephone, and said switch having contact-points to disconnect said cord from its ground-connection through the telephone, and at the same time connect it with the other cord for conversation.

11. In a telephone-exchange system, a pair of central-office cords with plugs adapted for use with line-switches, in combination with an operator's telephone, a switch, and a key, said cords being normally, or when not in use for conversation, disconnected from each other and one of them grounded through the operator's telephone, said key having a pair of contact-points normally open, but closed at the will of the operator, said points being in a branch circuit from the other cord through the telephone to the ground, and said switch having contact-points to disconnect said first-mentioned cord from the ground and connect it with the other cord for conversation.

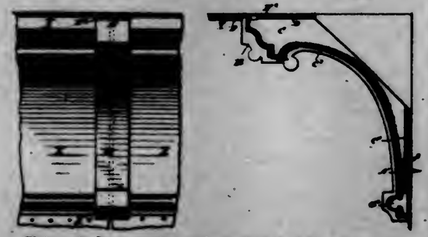


388,284. SODA-ASH FURNACE. John F. Kemmey, Elkton, Md., assignor of two-thirds to Thomas Groom and Andrew Rusk, both of same place. Filed Aug. 30, 1887. Serial No. 248,188. (No model.)

388,284.

Claim.—The inclosure B, having within the same the furnace F, the adjacent charging-chambers D D', with partition E between them and the boiler A, the pit C below said boiler, the said inclosure B having the openings H H in the sides of the charging-chambers, and the pit having side openings, J J, said parts being combined substantially as and for the purpose set forth.

388,285. METALLIC CEILING. William R. Kinnear, Columbus, Ohio. Filed Apr. 11, 1888. Serial No. 270,301. (No model.)



Claim.—1. In a ceiling such as described, the panels thereof constructed from continuous sheets, having margins raised above the body and a connecting portion between the body of the panel and the margins, which extend across the corners formed by the prolongation of the inner edge of the margins, substantially as described, whereby tearing of the material in the said corners where the panels are stamped is prevented.

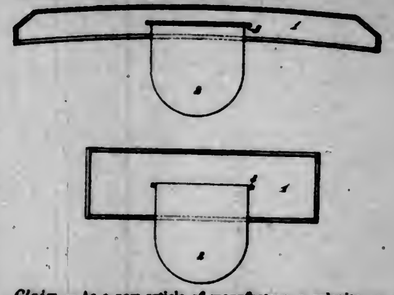
2. In a ceiling such as described, the panels thereof constructed from continuous sheets and having margins raised above the body and a connecting portion between the body of the panel and the margins having rounded corners, substantially as described.

3. In a ceiling such as described, the combination of the panels thereof, constructed from continuous sheets and having margins raised above the body, and provided at the corners with angular recesses cut therein, and a connecting portion between the body of the panels and the margins, which extend across the corners formed by the prolongation of the inner edges of the said margins, and ornamental drops fitted to the angular recesses in the corners of the panels, provided with extensions at the base for extending under the margins of the panels, substantially as described.

388,286. METALLIC CEILING. William R. Kinnear, Columbus, Ohio. Filed Apr. 26, 1888. Serial No. 271,602. (No model.)

Claim.—1. In a cornice such as described, the combination of the separate pieces composing the cornice, a skeleton for maintaining the shape of the meeting ends of the said pieces, a shield for concealing the junction, and suitable fastenings for connecting the skeleton and shield, substantially as described.

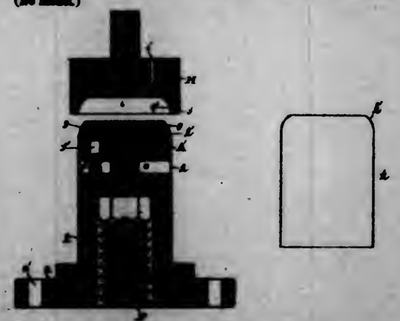
2. In a cornice such as described, the combination of the separate pieces composing the cornice, a skeleton for maintaining the shape of the meeting ends of the said pieces, being rigidly attached to the walls of the structure to which the cornice is applied and having an undercut portion, and a shield for concealing the junction of the said pieces, shaped to fit the undercut portion of the skeleton, the being retained in position thereby, substantially as described.



3. In a cornice such as described, the combination of the separate pieces composing the cornice, a skeleton for maintaining the shape of the meeting ends and being partly cut away to form steps, and a shield shaped to correspond to the form of the skeleton, for concealing the junction of the said pieces, and provided with lugs to engage the said steps on the skeleton, for adjustment of the parts, substantially as described.

4. In a ceiling such as described, provided with a styling, a cornice, the sides of which are adapted to receive the ends of the separate pieces of which the styling is composed, provided with end extensions for suspending the same, and thereby supporting the ends of the said styling-pieces, substantially as described.

5. In a ceiling such as described, provided with a cornice and styling, a bracket for concealing the junction of the pieces composing the cornice and the styling, corresponding to the shape of the former and provided with an extension passing over the latter and under the edge of the adjoining panels, for concealing and supporting the ends of the separate pieces composing the said styling, substantially as described.

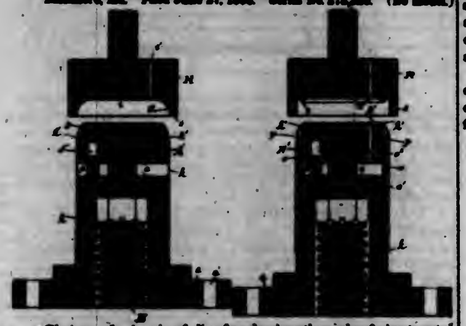


6. In a ceiling such as described, provided with a cornice and styling, the combination of brackets for concealing the meeting ends of the pieces composing the cornice, and cross-bars extending across the styling for supporting the ends of the pieces composing the same, and provided with end extensions adapted to extend under the top of the said bracket and the edge of the adjoining panels, substantially as described.

388,287. COLLAR OR CUFF. Ezra Knapp, Adams, Mass. Filed Nov. 7, 1885. Serial No. 182,193. (No model.)

Claim.—As a new article of manufacture, a xyloidin or other pyroxyline collar or cuff having a cape of textile fabric cemented thereto at or adjacent the center of the article, said cape being fastened by means of an auxiliary strip of xyloidin or other pyroxyline material placed along the attaching-edge of the textile fabric and projecting beyond the ends thereof, substantially as shown and described.

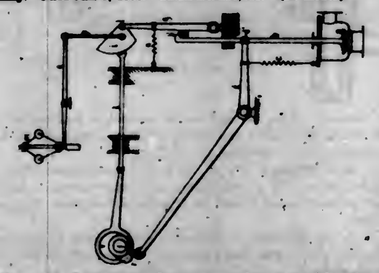
388,288. DIE FOR THE MANUFACTURE OF CANS. George W. Knapp, Baltimore, Md. Filed June 27, 1888. Serial No. 278,319. (No model.)



Claim.—1. A pair of dies for shaping the ends of sheet-metal cans consisting of a base part, A, provided with a vertically-movable die-head, A', having a turned-off or rounded top rim, *g*, in combination with a punch part, B, having a downward rim, *j*, the inner circumference, *f*, of which is conserved as a counterpart to the said rounded top rim, as set forth.

2. A pair of dies for shaping the ends of sheet-metal cans, consisting of the base part A, having a central bottom cavity, *h*, with a central opening in its top, a die-head, A', above the base part, having a turned-off or rounded top rim, *g*, a bolt, *d*, passed through said central opening and connecting the die-head and base part, and a spring, H, occupying the bottom cavity and pressing up against the said bolt, in combination with a punch part, B, having a downward rim, *j*, the inner circumference, *f'*, of which is conserved as a counterpart to the said rounded top rim, as set forth.

3. Two pairs of dies for shaping the ends of sheet-metal cans, the first pair consisting of the base part A, provided with a vertically-movable die-head, A', having a turned-off or rounded top rim, *g*, and a punch part, B, having a downward rim, *j*, the inner circumference *f*, of which is conserved as a counterpart to the said rounded top rim, in combination with the second pair, consisting of the base cylinder, L, having at the top a solid rigid center, *n*, with a vertical wall, *o*, and around the said center an annular seat, *p*, the outer edge of which is highest and forms an annular channel, and the punch Q, having a downward rim provided with two annular vertical faces, *s'* and L', and between them an annular channel, *p'*, which is the counterpart of the said annular seat on the base part, for the purpose set forth.



388,289. DIE FOR FORMING CAN-BODIES. George W. Knapp, Baltimore, Md. Filed June 27, 1888. Serial No. 278,320. (No model.)

Claim.—1. A pair of dies for shaping the ends of sheet-metal cans, consisting of the base part N, having at its top a cup, *o*, with an inwardly-beveled rim, and a die-head, N', having a beveled top rim, *p'*, and occupying said cup and yielding vertically therein, in combination with a punch part, R, having a downward rim, *s*, and an annular V-shaped ridge, *t*, in a cavity within said downward rim.

2. A pair of dies for shaping the ends of sheet-metal cans, consisting of the base part N, having at its top a cup, *o*, with an inwardly-beveled rim, a die-head, N', having a beveled top rim, *p'*, and occupying said cup, and a spring to lift the die-head from its seat, in combination with a punch part, R, having a downward rim, *s*, and an annular V-shaped ridge, *t*, in the cavity within said downward rim.

388,290. VALVE-GEAR. Heinr Kliemann, Hanover, Prussia, Germany. Filed Jan. 3, 1888. Serial No. 259,665. (No model.)

Claim.—1. A valve-gear for power-engines, comprising the valve *a*, having the stem *b*, with shoulder *b'*, the pawl *g*, with shoulder *h*, the springs *c* and *n*, or equivalent weights, and the two reciprocating parts *d* and *k*, actuated by the engine, all combined and operating together substantially as and for the purpose set forth.

2. A valve-gear for power-engines, comprising the valve *a*, having the stem *b*, with shoulder *b'*, the pawl *g*, with shoulder *h*, the springs *c* and *n*, or equivalent weights, the two reciprocating parts *d* and *k*, actuated by the engine, the eccentric center *i*, or its described equivalent, a governor, *m*, and parts connecting the center *i*, or its equivalent, with the governor, all combined and operating together substantially as and for the purpose specified.

388,291. TWO-WHEELED VEHICLE. Frank B. Lay, Kalamazoo, Mich. Filed July 5, 1887. Renewed Mar. 22, 1888. Serial No. 268,033. (No model.)

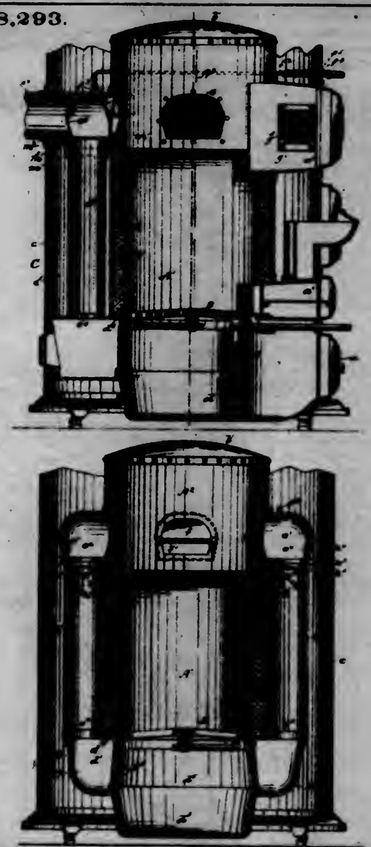
Claim.—1. In a two-wheeled vehicle, the combination of a fulcrumed body, thills, and the hangers, comprising the two parallel spiral springs, a cap at both ends intending across the ends of each spring, and two eyed bolt-pin rods, one arm of each passing in opposite directions through one end of the caps and through one spring, and the other arm of each passing in like manner through the other end of the caps and through the other spring, the free ends of said arms being retained by nuts or heads, substantially as set forth.

2. The combination of a two-wheeled vehicle, thills, and fulcrumed body or seat-bars with the double spiral spring-hangers on each side jointedly attached to the thills and body, substantially as set forth.

388,292. TWO-WHEELED VEHICLE. Frank B. Lay, Kalamazoo, Mich. Filed Apr. 7, 1888. Serial No. 269,989. (No model.)

Claim.—1. The spring-hangers for suspending a vehicle-body or seat-bars, said hanger comprising the upper and lower equalizers having the central hole, and the two springs side by side and jointedly attached at the ends to the ends of the equalizers, substantially as set forth.

2. The combination of a wheeled axle, thills, fulcrumed body or seat-bars, and the elastic hangers comprising the equalizers, one jointedly attached to the thills, the other jointedly attached to the body, and springs jointedly attached at the ends to the equalizers each side of the center or pivotal attachment of said equalizers to the thills and body, substantially as and for the objects set forth.



3. The combination of a wheeled axle, thills, a fulcrumed body or seat-bars provided with a suitable number of hooks, the upper equalizers pivotally attached to the thills, the lower equalizers pivotally and detachably attached to the seat-bar hooks, and the springs jointedly attached at the ends to the ends of the equalizers, substantially as set forth.

388,293. HEATING-FURNACE. Frank A. Magee and Sylvester Van Vleet, Chelsea, assignors to the Magee Furnace Company, Boston, Mass. Filed Oct. 2, 1888. Serial No. 286,126. (No model.)

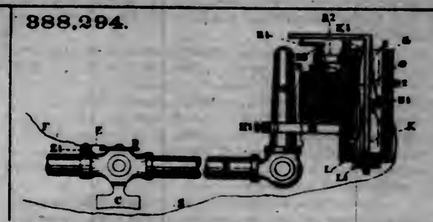
Claim.—1. In a furnace, the combination of the outer shell or casing, C, the inner shell, *b*, the air-heating chamber *c* between the two shells, the fire-pot A', and combustion-chamber A^2, inclosed by the inner shell, *b*, a top plate, *b'*, the base having the deep section *d* and the semi-circular extension D for the flue *d'*, the said flue, the flue-plate d^2, the openings *e* through the side of the shell *b*, the connections *f*, the pipes f^2, the plate d^3, having the openings e^2 e^3, the pipe e^4, the direct escape-pipe e^5, and the damper *a*, substantially as described.

2. In a hot-air furnace, the combination, with the combustion-chamber and fire-pot section of the furnace, of a base-section which is provided with a central depressed ash-pit portion and an outwardly and upwardly flaring substantially semicircular portion, d^2, formed together in a single casting, and which is provided, also, with vertical

388,293.

curved plate d^4, extending from the upper extremity of the depressed portion to the upper extremity of such base-section and separating the ash-pit portion from the base-flue portion of such base-section, substantially as described.

3. In a hot-air furnace, the combination, in the base-section thereof, of the one-part lower portion, having the central depression provided with the bottom plate, d^3, and having also the outwardly and upwardly flaring portion or prolongation d^2, the covering-plate d^4, provided with the openings c^4 c^4 at the sides, and with the rear opening, c^5, and the intermediate imperforate plate, d^4, extending from the top of the central depression to the bottom of the covering-plate d^4, and separating the ash-pit chamber from the semicircular base-flue, substantially as described.



4. The combination of the combustion-chamber, formed with entrance a^2, the plates g', forming the vertical walls to the passage a^2 and having perforations g^3, the chambers g, formed by the plates g' g^3, and the perforations or holes g^4 in the plate g^3, providing air-inlets to the chambers g, substantially as described.

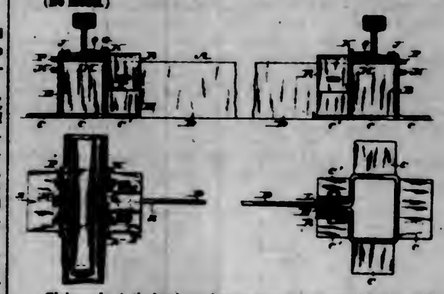
5. In a heating furnace or stove, the combination, with the pipe c^2, of the ring h, fitted within such pipe below the upper extremity thereof, and having the upper indrawn portion or contraction, h', forming, in connection with the inner face of the pipe, the recess or pocket h^2, and the box or section c', having at its lower extremity an inner and an outer depending flange, the outer flange embracing the exterior surface of the pipe c^2, and the inner flange extending into the recess or pocket h^2, between the body of the pipe and the upper extremity or contraction, h', of the ring h, substantially as and for the purposes specified.

388,294. ELECTRIC GAS-LIGHTER. JOHN J. HEDGWIN, Ithaca, N. Y. Filed June 24, 1887. Serial No. 242,344. (No model.)

Claim.—An electric gas-lighting apparatus organized with a cock and burner, a primary-circuit breaker connected to that cock and arranged to close the electric circuit when the gas is turned on, a gas-

388,294.

lighter consisting of an electro-magnet placed in that circuit and arranged to attract an armature which in moving causes the circuit to be broken and the gas to be lighted by the resulting spark, and a secondary-circuit breaker arranged to break the circuit by the heating and consequent expansion by the gas-flame of some of the parts of that secondary-circuit breaker.



388,295. MACHINE FOR THE MANUFACTURE OF CONDUITS. HERMAN HERMAN, Boston, Mass. Filed July 13, 1887. Serial No. 244,131. (No model.)

Claim.—1. In a machine for manufacturing multiduct pipes or conduits, the combination, with the mold-box having a series of mandrels or formers, a, of a series of tamps, B, a series of rods for operating said tamps, and a plate, D, having a series of holes, d, for guiding the tamp-rods, and a series of larger holes, d', to receive the upper ends of the mandrels and bring them into and hold them in proper or true positions, substantially as set forth.

2. In a machine for making multiduct pipes or conduits, the combination, with a mold-box having a series of mandrels or formers, a, of a series of reciprocating tamps and tamp-rods, and a reciprocating plate, D, having a series of holes, d', to receive the mandrels, and a series of holes, d, to permit of the passage of the tamp-rods, but not of the tamps, so that the latter will lift the said plate and cause it in its descent to strike or jar the mandrels and center the same, substantially as set forth.

388,296. RAILROAD TIE AND RAIL FASTENING. JAMES B. HILLHOUSE, Philadelphia, Pa. Filed Dec. 14, 1887. Serial No. 257,963. (No model.)

Claim.—1. A tie having a box at one end, in combination with a chair resting on said box and having a forked portion secured to said tie, substantially as described.

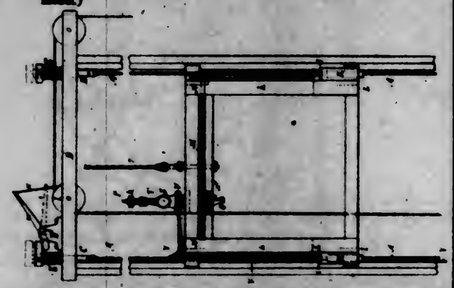
2. A tie having a box at one end, in combination with a chair resting thereon, and a cheek-piece, the latter having a depending forked portion secured to said tie, substantially as and for the purpose set forth.

3. A wrought-metal tie formed of a single piece of material and having the box B, with base-pieces C C, substantially as and for the purpose set forth.

4. A tie having the box B at one end, in combination with the chair G, having curved cheek-pieces J J on one side and upright pieces K K on the opposite side, and wings P overlapping the box, substantially as and for the purpose set forth.

5. A tie having the box B at one end, with slot therein, in combination with the chair G, having cheek-pieces J and uprights K, and a tongue, M, entering said slot N, substantially as and for the purpose set forth.

6. The chair G, having wings P, which overlap the top of the supporting-box, substantially as described.



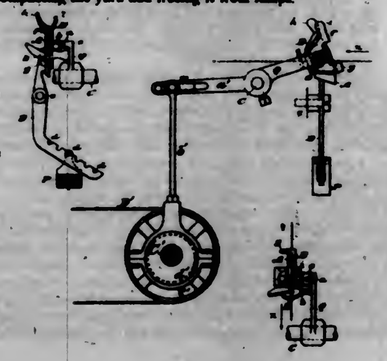
7. The tie D, with the box B and lip E, in combination with the chair G, having fork L embracing said tie and lip E and secured to the same, substantially as and for the purpose set forth.

8. The chair G, having fork L, substantially as described.

9. The tie D, with the box B and lip E, in combination with the chair G, having the fork L, and the cheek-piece Q, with depending fork R, the latter embracing fork L, and the bar D and lip E, substantially as and for the purpose set forth.

10. In a railroad-tie, a bar connecting opposite ties, in combination with a chair having a fork which embraces said bar, and a cheek-piece having a fork which embraces the fork of the chair, substantially as described.

388,297. SAFETY APPARATUS FOR ELEVATORS. JOSEPH A. HOYER, Boston, Mass. Filed Mar. 1, 1888. Serial No. 265,702. (No model.)



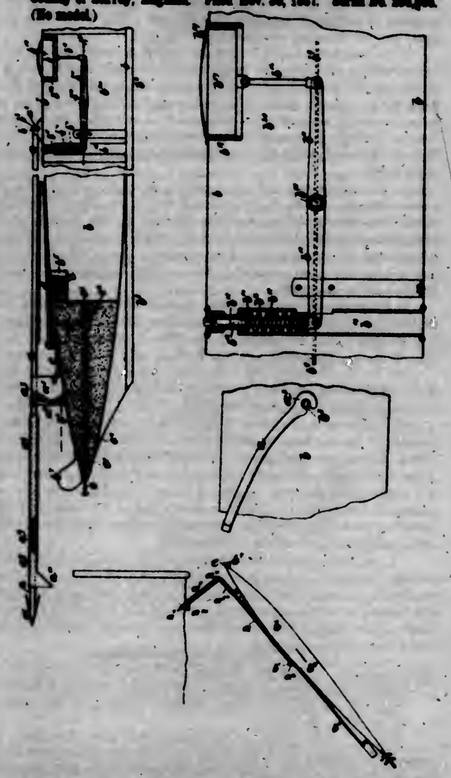
Claim.—1. In an elevator, the cabin A A, the headed slides B C, provided with springs and supported substantially as described, and the guides or bosses K K, fixed to the car and each provided with a jaw, as shown, and having a slide, L, arranged therein and provided with a follow jaw, as set forth, in combination with a mechanism operated by the governor, essentially as described, it consisting of the connection-rods A A, arms N N, shaft M, arms N', link i, and lever O, pivoted to the car, the governor receiving its motion from a rope suspended in the well and passing around the grooved wheel U and over sheaves V W, secured to the car, all as shown, and essentially as set forth.

2. The combination of the car and the clamp with the cables A A, the slides B B, supported essentially as shown, the springs B K, the lever G, the shipper-wheel, and the rope connecting said lever and wheel, as set forth.

3. In an elevator safety device, the box or guide K, chambered, as shown, and provided with the jaw a, incline c, and guide l, in combination with the slide L, having the jaw c and slot f, through which extends the bolt g and connects the slide to the box, all substantially as represented.

388,298. DEVICE FOR CLEANING AND COMPACTING YARN AND FOR TESTING THE STRENGTH OF THE SAME. HENRI GIFFARD and CHARLES FRANÇOIS, Hohwarth, France. Filed Mar. 30, 1888. Serial No. 269,024. (No model.) Patented in France Sept. 21, 1887, No. 185,925; in England Sept. 28, 1887, No. 12,939, and in Belgium Feb. 28, 1888, No. 82,859.

Brief.—The object of the invention is to produce a device for testing the strength of yarn or thread in order to discover flaws therein before it goes to the loom, and at the same time for rubbing and compacting the yarn and freeing it from lumps.



Claim.—1. In a device for cleaning and compacting yarn and for testing the strength of same, the combination, with a jaw, as B, and means for vibrating said jaw, of a jaw, as A, arranged face to face with jaw B and held up to the same by a yielding pressure, and means for holding said jaw up to jaw B, substantially as and for the purposes set forth.

2. In a device for cleaning and compacting yarn and for testing the strength of same, the combination, with a jaw, as B, and means for vibrating said jaw, of a jaw, as A, arranged face to face with jaw B and held up to same by a yielding pressure, and means for holding said jaw up to jaw B, one of said jaws being furnished with a scraper, substantially as described, for removing lumps from the yarn.

3. The combination, with the vibrating jaw B, provided with an aperture, O, and shoulders or lugs f g, to prevent the escape of the yarn, and means for vibrating said jaw, of the jaw A, mounted on the lever D, the said lever, and the weight P, whereby said jaw A is held up to the jaw B with a yielding pressure, substantially as set forth.

4. The combination, with the rock-shaft C and its arm Q, as described, of the jaw B, coupled to said arm, said jaw being provided with yarn-retaining lugs f and g, the jaw A, arranged face to face with said jaw B, and means, substantially as described, for holding the jaw A up to jaw B with a yielding pressure, substantially as set forth.

388,299. MEANS FOR OPERATING HARBOR TORPEDOES. JAMES O'HEAR, London, and RICHARD A. GRAHL, 26 Rhodrell Road, Rushford, County of Surrey, England. Filed Nov. 26, 1887. Serial No. 256,408. (No model.)

Claim.—1. The combination of a torpedo, a detachable harpoon carried thereby for engaging with the defenses of the object to be destroyed, and a line connecting the torpedo and the harpoon after their separation, substantially as set forth.

2. The combination of a torpedo and a harpoon connected by a separable bearing and adapted to engage the defenses of the object to be destroyed, a connecting-line to control the subsequent movement of the torpedo, and suitable driving mechanism, substantially as set forth.

3. In combination with a torpedo, a harpoon, a plate on the torpedo having a trigger pivoted thereto, means for releasing the trigger from the harpoon, detachable connection between the harpoon and

torpedo, and a spring for forcing the torpedo away from the harpoon when the latter attaches itself, substantially as and for the purpose set forth.

4. In combination with a marine torpedo, a suitable device having a lance-head provided with cars adapted to lie back while the head is passing through the net-links of the netting defenses of a vessel and to spring open again as soon as it has passed clear through, detachable connection between the lance-head device and the torpedo, and a line connecting them together, substantially as and for the purpose set forth.

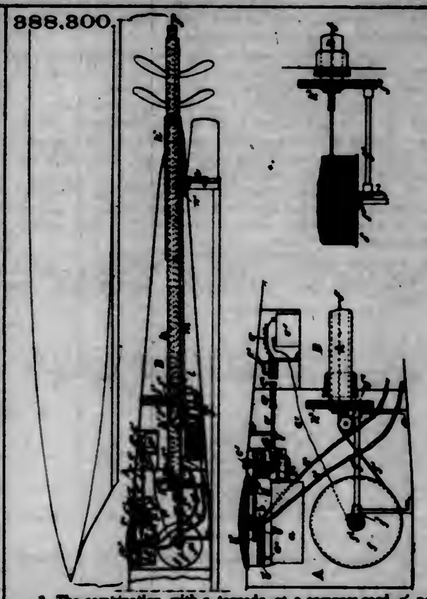
5. A torpedo provided with means for enabling it to attach itself to or make use of the netting defenses of a vessel and to be directed underneath such netting or over the boom, said means consisting of a harpoon projecting from the forward part of the torpedo, detachable connection between the harpoon and torpedo adapted to operate when the harpoon strikes the netting, means for directing the torpedo into a divergent course, a line connecting the harpoon and torpedo, and means for regulating its depth of immersion, substantially as set forth.

6. In combination with a torpedo, a harpoon, a plate secured to the torpedo, a forked trigger pivoted to said plate, a projection on the torpedo with which said trigger engages, said harpoon being adapted to rest between the forks of the trigger, a spring situated between the latter and the plate, a sleeve on the forward part of the harpoon, a plate on the end of the said sleeve, a detachable connection between the rear end of the harpoon and the torpedo, a spring adapted to be compressed by an inward thrust of said sleeve, whereby the harpoon is disengaged from the torpedo and a line connecting the latter and the harpoon, substantially as set forth.

7. In combination with a torpedo, a harpoon, oval trunnions and round bearings connecting the harpoon and the torpedo, hitching mechanism near the forward end of the harpoon detachably securing the latter to the torpedo, means for engaging said hitching mechanism, a spring or springs adapted to be compressed between the harpoon and torpedo, whereby the former will be forced away from the latter when they are detached, and a line connecting them together, substantially as set forth.

8. In combination with a torpedo, a harpoon, a sleeve fitted loosely thereon, a plate on the forward end of the sleeve, hitching mechanism detachably securing the harpoon to the torpedo and adapted to be engaged by said sleeve, detachable connection between the rear end of the harpoon and the torpedo, a spring interposed between them, and a line connecting them together, substantially as and for the purpose set forth.

9. In combination with a driven torpedo having a firing-pin on its point, as explained, a spring, b, situated at one side of the firing-pin, whereby premature action of the latter is prevented when the torpedo strikes the netting or other defenses of a vessel, as set forth.



10. In combination with a torpedo, means for regulating the depth of immersion, consisting of fins b^9 on both sides of the torpedo secured to a horizontal shaft, b^{10}, passing through the latter, beam-lever b^{11}, secured to the shaft, vertical rod b^{12}, hinged to the lever, plunger b^{17}, having hinge-connection with the rod b^{12}, cylinder b^{13}, in which said plunger is adapted to be raised or depressed, elastic cover b^{16} on said plunger, effectually excluding water from the cylinder, tube b^{15}, within which the front portion of the lever is adapted to play, a spring, b^{14}, within the tube, bearing on the end of the lever, and an adjusting device provided with a shoulder against which the spring bears, substantially as shown and described.

11. In combination with a torpedo having a detachable harpoon and the devices for controlling the torpedo when the harpoon strikes the netting or other defenses of a vessel, a spring interposed between the torpedo and harpoon, adapted to direct the torpedo in a downward course when it is released from the harpoon, substantially as and for the purpose set forth.

388,300. ELECTRIC STEERING APPARATUS FOR TORPEDO-BOATS. James O'Kelly, London, and Bernard A. Gillies, 28 Hinchell Road, Hamhead, County of Surrey, England. Filed Jan. 3, 1888. Serial No. 259,932. (No model.)

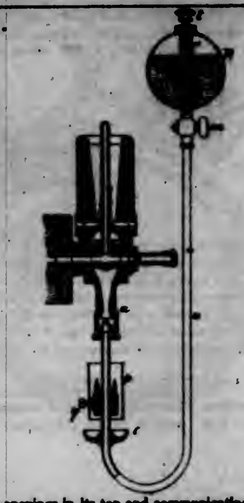
Claim.—1. In a torpedo, the combination, with the rudder, a wheel for controlling the rudder and interlocking mechanism between the rudder-wheel and propeller-shaft controlled by an electro-magnet, of a compass and a pivoted arm over the same carrying the ends of said magnet's conductors, the said compass carrying a conductor adapted to contact with said arm and complete circuit of the magnet, substantially in the manner described.

2. The combination, with the herein-described steering mechanism controlled by the contact of the compass-conductor with the pivoted arm, of means for controlling the rotation of said arm from a distant place, consisting of clock mechanism gearing with a pinion on the arm's axis, a check or brake engaging a wheel in the clock mechanism, and an electro-magnet controlled by a make and break at the distant place for operating the brake to release said clock mechanism, as set forth.

3. The combination, with a torpedo, of a compass-card, a', non-conducting circle a^9, vertical pins a^{10} a^{11}, axis b, arm b', conducting-wires b^2 b^3, clock-work mechanism for rotating the arm b', brake c, rod c', armature c^2, electro-magnet c^3, spring c^4, batteries c^5 b^4 b^5, conducting-wire f', electro-magnets i i^9, arms j j^9, shafts j^3, wheels j^4 j^5, worm or screw k', wheel l, chain, cord, or wire m, rudder-wheel n', and similar steering-controlling mechanism on the discharging ship or station connected by the conducting-wire f' with the above-mentioned mechanism of the torpedo, substantially as herein shown and described.

4. In combination with steering mechanism contained within a torpedo, a conducting-wire, f', connected therewith and with mechanism on the discharging ship or station, consisting of compass-card a', hand or arm b', axis b, conducting-wires b^2 b^3, clock-work mechanism for rotating the arm b', and brake apparatus c, c', c^2, c^3, c^4, and c^5, substantially as herein described.

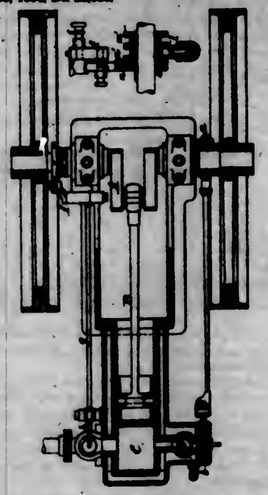
5. In combination with a torpedo, a wire, f', connecting the torpedo with a discharging ship or station and serving the double purpose of a mechanically-propelling wire and an electric conducting-wire to connect the steering-regulating apparatus on the discharging ship or station with that in the torpedo, substantially as herein described.



6. In the steering mechanism of ships and torpedoes, the combination of a compass-card, a', non-conducting toothed circle a^9, pinion a^8, lever a^6, vertical pins a^{10} a^{11}, axis b, arm b', link b^7, wires b^2 b^3, batteries b b^5, electro-magnets i i^9, arms j j^9, shafts j^3, wheels j^4 j^5, power worm or screw k', horizontal wheel l, chain, cord, or wire m, and rudder-wheel n', substantially as herein shown and described.

388,301. APPARATUS FOR HEATING THE IGNITING-TUBES OF GAS-MOTOR ENGINES. Eugene A. Otto, Cologne, Prussia, assignor to the Gas Motoren Fabrik Deutz, Deutz-on-the-Rhine, Germany. Filed Feb. 9, 1888. Serial No. 263,673. (No model.) Patented in England Dec. 20, 1887, No. 17,099; in Belgium Jan. 16, 1888, No. 80,268, and in Italy Mar. 31, 1888, No. 22,302.

Claim.—1. An apparatus for heating the igniting-tube of a gas-motor engine, consisting of a closed receptacle charged with combustible liquid, a pipe leading downward therefrom to a Bunsen or similar burner, and means for heating the pipe to volatilize the liquid before it issues into the said burner, a vertical internally-screw-threaded tube in the upper part of the receptacle containing the liquid, and a screw-rod adjustable in the tube to more or less close the upper end of the pipe leading to the burner, substantially as described.

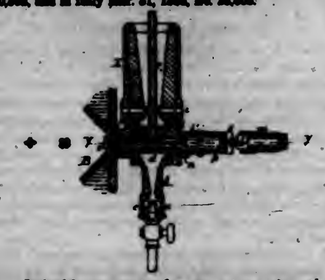


2. An apparatus for heating the igniting-tube of a gas-motor engine, consisting of a closed receptacle charged with combustible liquid, a pipe leading downward therefrom to a Bunsen or similar burner, an internally-screw-threaded tube in the upper part of the said receptacle, a vertical screw-rod adjustable in said tube to more or less close the upper end of the pipe leading to the burner, and a heater on the pipe to volatilize the liquid before it enters into the burner, composed of an annular chamber arranged around the pipe beneath the burner

388,301.

and having jet-openings in its top and communicating by an opening with the interior of the pipe, and a screw-plug for controlling said opening, substantially as shown and described.

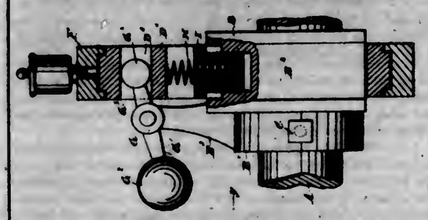
388,302. MOTOR-ENGINE WORKED BY COMBUSTIBLE GAS, VAPOR, OR SPRAY. Eugene A. Otto, Cologne, Prussia, assignor to the Gas Motoren Fabrik Deutz, Deutz-on-the-Rhine, Germany. Filed Feb. 9, 1888. Serial No. 263,672. (No model.) Patented in England Dec. 12, 1887, No. 17,102; in Belgium Jan. 14, 1888, No. 80,267, and in Italy Feb. 29, 1888. No. 22,302.



Claim.—1. In a gas-motor engine of the type described, the combination, with the cylinder and crank-shaft, of an igniting-slide driven by an eccentric on the crank-shaft and an escape-valve worked by an automatically-movable cam on the crank-shaft to only effect the opening of the escape-valve once in every two revolutions, substantially as described.

2. In motor-engines worked by combustible gas, vapor, or spray that operate with a cycle of four strokes, a discharge-valve that is worked by a cam on the engine-shaft, arranged to slide laterally thereon, so as only to act upon the valve at every second revolution of the engine-shaft, substantially as and for the purposes set forth.

3. In motor-engines worked by combustible gas, vapor, or spray that operate with a cycle of four strokes, a cam, n, for working the discharge-valve of the engine, which is situated upon a sleeve, o, on the engine-shaft, arranged to slide longitudinally thereon, and having a double groove, m m', in which works a stationary pivoted stud, l, so that at one revolution the stud works in the one groove and causes the cam to act upon the lever f of the discharge-valve, so as to open this, while at the next revolution the stud passes into the second groove, and thereby shifts the sleeve, so that the cam revolves without acting upon the lever f, substantially as herein described.

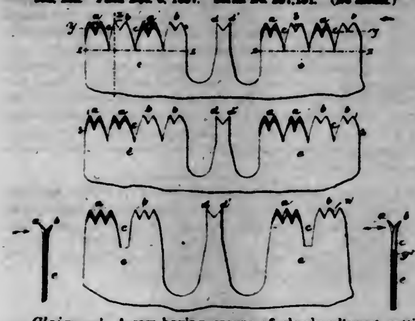


4. In motor-engines worked by combustible gas, vapor, or spray that operate with a cycle of four strokes, the combination of an igniting slide or valve, b, worked directly from the engine-shaft A by an eccentric, c, and a discharge-valve, f, worked directly from the engine-shaft A by a cam, n, on a sleeve, o, that is slid laterally thereon, so as only to actuate the discharge-valve at every alternate revolution, substantially as herein described.

388,303. IGNITING APPARATUS FOR GAS-MOTOR ENGINES. Eugene A. Otto, Cologne, Prussia, assignor to the Gas Motoren Fabrik Deutz, Deutz-on-the-Rhine, Germany. Filed Feb. 9, 1888. Serial No. 263,668. (No model.) Patented in Germany Nov. 3, 1887, No. 43,699; in England Jan. 16, 1888, No. 698; in Belgium Jan. 28, 1888, No. 80,383, and in Italy Mar. 31, 1888, No. 22,302.

Claim.—In igniting apparatus for gas-motor engines, the combination of a passage, A, communicating with the engine-cylinder and with an igniting-tube, r, heated externally by a Bunsen burner, a valve, v, closing said passage and connected, first, to a piston, s, having one or more channels communicating with the atmosphere, and, secondly, to a second piston, h, acting as a valve for closing the outer end of the passage A immediately after the valve v has been forced open for igniting the compressed charge, and means for operating the valve and pistons, substantially as and for the purposes herein described.

388,304. OUT-OFF-VALVE GEAR. Gustave B. Race, Everly, Iowa. Filed Mar. 16, 1888. Serial No. 267,371. (No model.)



Claim.—1. The combination, with a shaft-block having two of its sides parallel to form ways, of an eccentric having a transverse opening formed with parallel side walls fitting said ways to allow the eccentric to slide thereon, an expansion-spring within said opening and bearing against one end wall thereof and against the adjacent end of the block, and a vertically-swinging lever at right angles to the block and eccentric, weighted at its outer end and engaging the eccentric at its inner end to throw the eccentric against the action of the spring, substantially as set forth.

2. The combination, with the engine-block B, having ways B^2 B^2, a hub, B', and a standard, B^3, of the eccentric D, having a transverse central opening the side walls of which fit the said ways to allow the eccentric to slide thereon, and a recess, D^2, near the outer end of said opening, a lever, G, pivoted between its ends to the standard B^3, parallel with the axis of the block, having a weight at its outer end, and engaging the recess D^2 with its inner end to slide the eccentric in the direction of the length of its opening, and an expansion-spring for returning the eccentric to its normal position, substantially as set forth.

3. In a cut-off for steam-engines, the combination, with a block secured to the main driving-shaft, of an eccentric held to slide on the said block, and a weighted lever fulcrumed on the said block and engaging the said eccentric, a cap-nut screwing upon a sleeve, c, on the said block, and a spring resting with one end in the said cap-nut and with its other end against the said eccentric, substantially as shown and described.

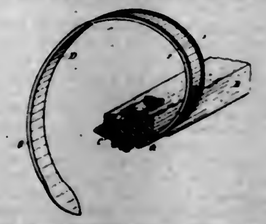
388,305. SAW. John J. Ralya and Samuel L. Reddick, Anderson, Ind. Filed Dec. 6, 1887. Serial No. 257,131. (No model.)

Claim.—1. A saw having groups of closely-adjacent cutting-teeth in which the outer cutting-edges of the outer teeth of the group incline slightly inward toward the adjacent teeth of the group, and in which all the teeth of each group are set in one and the same direction and those of the adjacent group of the same gang are set in the opposite direction, substantially as shown and described.

2. A saw having in the same elevated base a gang of cutting-teeth composed of two groups of teeth, all the teeth of one of each groups being set in one direction and all of those of the other group being set in the opposite direction, and also drag-teeth closely flanking such gang at each side on the same elevated base, substantially as shown and described.

3. A saw having groups of adjacent cutting-teeth having outer edges inclined inward toward the adjacent teeth of the group, all of each group being set in one and the same direction, the line of such set or bend being below the bottom of the notches *n*, all as set forth.

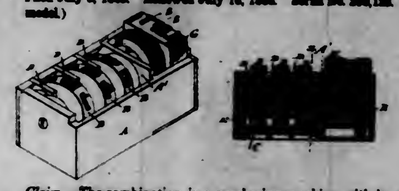
4. A saw having groups of closely-adjacent cutting-teeth, the outer edges being inwardly inclined, all set in one direction, and similar adjacent follow groups set in the opposite direction, both such groups being set at a line or point below the base of the teeth, all substantially as set forth.



5. A saw having its cutting-teeth set in groups, each group being set in a different direction from that of its next adjacent group, and having the opposite surfaces of its plate reduced or corrugated into grooves substantially at right angles to the length of the plate, these grooves or channels being opposite each other on opposite sides of the plate and inclining away from each other from the bottom of the notches or cuts which are between the teeth, substantially as set forth, and for the purposes described.

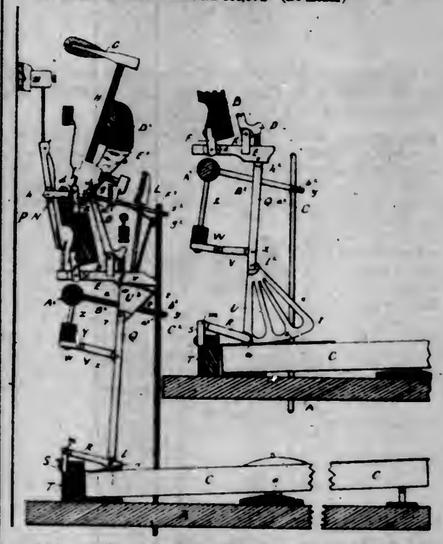
6. A crescent-saw having teeth sharpened at their tips to a double bevel, as set forth, and made in gangs composed of two groups, those of one group being all sharpened on one side of the plate and those of the other on the opposite side, and all of each group being set below the base of its teeth, substantially as set forth.

7. A saw having gangs of teeth closely adjacent in groups and sharpened to a double bevel, as set forth, all the teeth of one group being sharpened at the same side and set in one direction and those of its adjacent group sharpened at the other side and set in the opposite direction, such gangs alternating with drag-teeth.



8. In a saw having groups of small teeth at the top of elevated bases and having a deep open space, *i*, between such bases, transverse grooves A, made in the body of the plate below such spaces, as and for the purpose set forth.

388,306. SPRING-TOOTH HARROW. Hiram C. Reed and Asa Clark, Kalamazoo, Mich., assignors to D. C. and H. C. Reed & Company, same place. Filed Jan. 30, 1888. Serial No. 262,264. (No model.)



Claim.—The combination of a harrow-beam, a tooth or share, a clip channeled on the under side, and the binding-bolts, substantially as set forth.

388,307. CONSECUTIVE-NUMBERING MACHINE. James H. Rhemarde, Memphis, Tenn., assignor to Joseph Wetter, same place. Filed July 6, 1888. Renewed July 16, 1888. Serial No. 280,122. (No model.)

Claim.—The combination, in a numbering-machine, with its numbering-wheels and with a plunger or vertically-reciprocating type-block actuating said wheels in manner substantially as described, of a type-wheel interposed between the numbering-wheels and plunger and mounted upon a journal projecting from the latter, to be carried thereby at each depression thereof into line of print with the numbering-wheels, substantially in the manner and for the purpose herein set forth.

388,308. PIANO-FORTE. John P. Richardson, Cambridge, assignor to the Mason & Hamlin Organ and Piano Company, Boston, Mass. Filed June 16, 1888. Serial No. 166,574. (No model.)

Claim.—1. In a piano-forte action, in combination, key C, push-rod Q, plate or block U, pivoted to said rod, jack D, and hammer M, for the purpose specified.

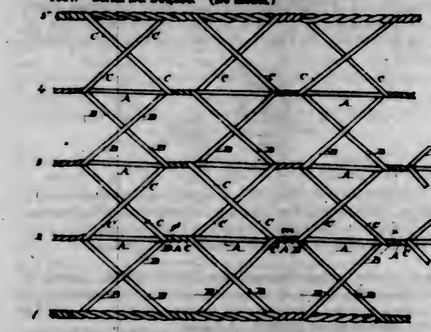
2. In a piano-forte action, in combination, key C, push-rod Q, plate or block U, pivoted to said rod and having a curved edge, *s*, eccentric to its pivot, jack D, and hammer M, for the purpose specified.

3. In a piano-forte action, in combination, key C, push-rod Q, plate or block U, pivoted to said rod, jack D, hammer M, and swiveling rail A^1, connected to said rod Q and to the pedal of the piano-forte, for the purpose specified.

388,309. ROTARY ENGINE. James C. Robertson, Eli F. Townsend, and William G. Root, Morrisdale Mines, Pa. Filed Mar. 30, 1888. Serial No. 268,201. (No model.)

Claim.—1. The combination, in a rotary engine of the cylindrical case A, having the exhaust-openings G, the rotary pistons journaled in the case A, arranged between the exhaust-openings, and having the peripheral groove, the shoulder or abutment M, having the cam-faces N O, extending in opposite directions, the latter being provided with the opening P and the said rotary piston being provided with the openings R, communicating with the opening P, the valve-case to which fluid-pressure is introduced, and the valve pivoted in the valve-case and bearing in the peripheral groove of the rotary piston, substantially as described.

2. The combination of the circular case A, having the exhaust-openings G, and the channel H, communicating therewith, the rotary

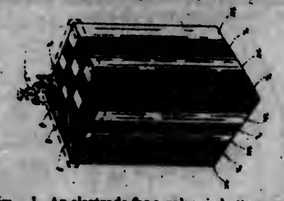


388,309.

piston journaled in case A and having the peripheral groove, the shoulder or abutment M, with the cam-faces N O, extending in opposite directions, the latter having the opening P and the rotary piston being vertically divided with the openings R, communicating with the opening P, the circular valve-case secured to the case A and having the opening T on the face of the piston, the inlet-opening A' and the opening Z, communicating with channel H, and the valve E', pivoted in the valve-case near its center, the shorter end of said valve bearing against the inner side of the valve-case, and the outer end thereof being adapted to bear in the bottom of the peripheral groove, substantially as described.

388,310. WITHDRAWN.

388,311. WIRE FENCE. Benjamin Scahler, Clinton, Mass., assignor to the Clinton Wire-Cloth Company, same place. Filed July 21, 1887. Serial No. 244,893. (No model.)



Claim.—1. In a wire fence composed of longitudinal body-wires A and oblique filling-wires B C, the herein-described joint between said wires, comprising a single complete coil of the body-wire and one and a half coils of each filling-wire, the three wires being twisted together and coiled around each other, and the center of the body-wire coil being in the center of the joint.

2. The improved wire fence herein described, composed of a series of horizontally-arranged body-wires, A, and oblique filling-wires B and C, connecting said body-wires, the joint between said wires comprising a single complete coil of the body-wire and one and a half coils of each filling-wire, the three wires being twisted together and coiled around each other, and the center of the body-wire coil being in the center of the joint, the coils of each body-wire being twisted alternately in opposite directions.

3. The improved wire fence herein described, composed of a series of horizontally-arranged body-wires, A, the upper and lower members whereof comprise a number of strands twisted into a cable, and oblique filling-wires B and C, connecting said body-wires, the joint between said wires comprising a single complete coil of the body-wire and one and a half coils of each filling-wire, the three wires being twisted together and coiled around each other, and the center of the body-wire coil being in the center of the joint, the coils of each body-wire being twisted alternately in opposite directions.

388,312. BATTERY-ZINC. Benjamin Scahler, Clinton, Mass., assignor of one-half to Charles Dubreuil, same place. Filed Feb. 17, 1888. Serial No. 264,264. (No model.)

Claim.—1. An electrode for a galvanic battery, comprising zincs, interposed felts, and metallic connections between the zincs.

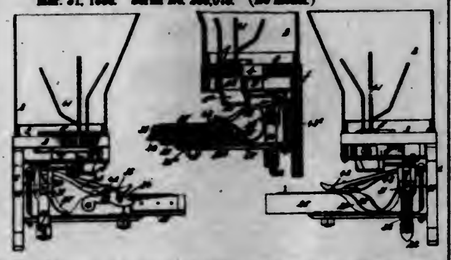
2. An electrode for a galvanic battery, comprising a number of zincs and a number of felts disposed in alternation, the zincs being connected by metallic connections.

3. An electrode for a galvanic battery, comprising a number of zincs and a number of felts disposed in alternation in juxtaposition and saturated with an acid solution, said zincs being connected by metallic connections.

388,313. HORSE-BOOT. Charles C. Sheild, Peter J. Sheild, and Frank L. Sheild, Ionia, Mich. Filed Apr. 14, 1888. Serial No. 270,679. (No model.)

Claim.—1. A covering for horses' hoofs, comprising a sponge-lined casing having the shape of the hoof, and a sponge-lined pad made separate from the casing but connected thereto, the said pad comprising a vertical portion, *g*, an integral horizontal portion, *g'*, and a wire, I, arranged in said vertical and horizontal portions to maintain the shape of the pad, as set forth.

2. A covering for horses' hoofs, comprising the metallic casing A, having the shape of a horse's hoof and sufficiently larger than the same, whereby it may be lined with sponge and the sponge lining stitched to the inside of the casing, said casing being made of a single piece and entirely covering the front and sides of the hoof, and the sponge-lined leather pad G, entirely separate from the metallic casing and covering the rear and bottom of the hoof, said pad having the sponge lining stitched thereto and comprising the part *g*, concaved to fit against the rear outer part of the heel of the hoof, and the flat projection *g'*, integral with the part *g* and extended at an angle thereto and fitting under the frog of the hoof, and the strap K, connecting the pad G to the sponge-lined casing, as set forth.



3. A covering for horses' hoofs, comprising the metallic casing A, having the shape of a horse's hoof and sufficiently larger than the same, whereby it may be lined with sponge and the sponge lining stitched to the inside of the casing, said casing being made of a single piece and entirely covering the front and sides of the hoof, and the sponge-lined leather pad G, entirely separate from the metallic casing and covering the rear and bottom of the hoof, said pad having the sponge lining stitched thereto and comprising the part *g*, concaved to fit against the rear outer part of the heel of the hoof, and the flat projection *g'*, integral with the part *g* and extended at an angle thereto and fitting under the frog of the hoof, and the strap K, connecting the pad G to the sponge-lined casing by having one end connected to one side of the casing, then passing through loops attached to the pad and having its other end adjustably connected to the outer side of the casing by a buckle, and a wire, I, inclosed within the pad G to maintain the shape thereof.

4. The combination of the casing A, provided with the three series of openings C, D, and E, having its upper edge bent over out-

wardly on itself at *c'*, and its lower edge bent over outwardly on itself at *c²* and re-enforced by the wire B, and the heel-pad consisting of a leather backing and sponge lining attached to the rear of the casing between the ends thereof, substantially as specified.

5. The combination of the casing A, having the openings C, D, and E, the sponge lining F, the leather backing having the concave upper part, *g*, and the lower flat projection, *g'*, kept in form by the wire I and rivets *i*, the sponge lining A, the loops J, the strap K, secured by rivets *k k* to the casing, the buckle L, strap *l*, and wires M, substantially as specified.

388,314. CIGAR-MAKING MACHINE. ABRAHAM H. SHOOK, Lancaster, Pa., assignor of one-half to Samuel Kaufman, same place. Filed Mar. 31, 1888. Serial No. 269,075. (No model.)

Claim.—1. In a cigar-bunching machine, the combination, with a feed-hopper having in its bottom or floor a feed-chamber, 4, of an upper cut-off or pivoted valve, 5, closing said chamber, a movable cut-off or valve below the floor of the hopper, containing a second feed-chamber, 12, of suitable dimensions to contain the tobacco received from chamber 4, means for alternately actuating said upper and lower cut-offs, whereby the former shall close chamber 4 above when the latter opens it below, and vice versa, a third chamber formed in a stationary plate and arranged beneath the lower cut-off out of line with chamber 4, whereby feed-chamber 12 may discharge therein when the lower cut-off closes chamber 4, and a cut-off, 15, for closing the bottom of the chamber in said stationary plate, substantially as described.

2. In a cigar-bunching machine, the combination, with a feed-hopper having a feed-chamber in the bottom thereof, of an upper cut-off closing said chamber, a cut-off plate moving beneath the floor of the hopper and having a second feed-chamber which may be caused to register with that in the hopper-floor, a stationary plate below the second feed-chamber, having a chamber, 12ª, a valve below and pivotally mounted upon the stationary plate, the said valve being normally closed to prevent exit from the chamber 12ª by a spring-actuated lever, and a bracket-arm operating said lever and the cut-off plate and upper cut-off in such manner as to bring the feed-chambers to register when the upper cut-off and valve of the lower cut-off plate are closed, substantially as described.

3. In a cigar-bunching machine, the combination, with a hopper having in its floor a feed-chamber, 4, of an upper cut-off or valve, 5, a movable cut-off or valve, 9, below the hopper-floor, and having a second feed-chamber, 12, and means for alternately operating said upper and lower cut-offs, said feed-chamber 12 being of dimensions to receive and hold the loose tobacco received from feed-chamber 4, and being, moreover, provided with a movable block, 43ª, adjustable between the parallel sides of one end of chamber 12, said block having a recess supplementing the form of the bunch, substantially as described.

4. In a cigar-bunching machine, the combination, with a segmental table and with an apron overlying the same, of a bracket-arm having uprights, a bunching-bar journaled in supports on said uprights and sweeping over the table beneath the apron, a friction-clamp lying upon the said apron, and a lift at or near the inner angle of the table to raise the inner end of the bunching-bar against the downward tension of a spring, substantially as described.

5. In a cigar-bunching machine, the combination, with a table of segmental form having a recess and with an apron lying thereon, said apron being parallel to the chord of the arc formed by the outer edge of the segmental table, of a bunching-bar lying on said table beneath the apron, a bracket-arm carrying said bunching-bar and having supports therefor, in which said bunching-bar is vertically movable, and a lift upon the inner angle of the table, with which said bunching-bar comes in contact to raise the inner end, substantially as described.

388,315. INSECTICIDE. JAMES T. SUTTON, Jefferson, Tex. Filed Nov. 7, 1887. Serial No. 254,316. (No specimens.)

Claim.—The herein-described insecticide, consisting of bisulphide of carbon, pulverized sulphur, solution of saltpeter, solution of cyanide of potassium, benzine or naphtha, kerosene-oil, and sulphuric ether, mixed together in substantially the proportions specified.

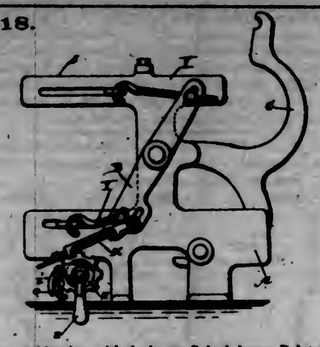
388,316. BUTTON-HOLE ATTACHMENT FOR SEWING-MACHINES. JACOB L. SMITH, Rochester, Pa. Filed Jan. 19, 1888. Serial No. 261,242. (No model.)

Claim.—1. The combination, with the face-plate of a sewing-machine formed with slots and grooves, said having a set-screw mounted therein, the end of which projects into the main slot, and with the needle-bar having vertical movement in said face-plate, of the T-extension removably secured to the lower end of the needle-bar, having flanges formed with one side thereof and a slot in the opposite side, an inwardly-projecting guide-key mounted between and held by said flanges of the extension, the horizontally-arranged transversely-sliding needle-holding block mounted in the lower part of the T-extension, provided with a groove engaging the guide-key, and with a stud passing through the slot in said extension, the needle carried by said sliding needle-block, the lever C, pivoted to the vertical member of the extension, having its lower end apertured to engage the stud or pin of the sliding needle-holding block and its upper end provided with a guideway, the smaller lever, D, pivoted to the upper part of the lever C and having a stud projecting from one side thereof, which engages with and moves in the guideway in the upper end of the lever C, and provided with a slot in its opposite end, and a spring having its lower end bent into a loop and surrounding and held by the fulcrum-screw of the lever C and its upper end in engagement with the slotted end of the lever D, substantially as described.

2. The combination, with the face-plate having slots and grooves therein, and a set-screw having its end projecting into the main slot thereof, and with the needle-bar, of the T-extension having the upper end of its vertical member provided with a socket for removable attachment to the lower end of the needle-bar and its horizontal member forming a tubular bearing, the sliding needle-holding block mounted in the horizontal member of the T-extension, the needle carried by said needle-holding block, the lever C, pivoted to the vertical member of said extension and engaging at its lower end with the sliding needle-holding block, the lever D, pivoted on the upper end of the lever C, and the spring secured at its lower end to the fulcrum of the lever C and its free end engaging with the lower end of the lever D, substantially as described.

388,317. CHAIN-WHEEL. RALPH J. SMITH, Sunderland, County of Durham, England. Filed Feb. 15, 1887. Renewed Jan. 9, 1888. Serial No. 260,234. (No model.) Patented in England Feb. 20, 1886, No. 4,161.

Claim.—In a chain-wheel, in combination with the disks A and B, having the radial ribs E E on their inner faces and united by the internal boss or hub, C, the whelps or bosses F, made in semicircular series and bolted in place, substantially as shown and described.



388,318. SHEDDING MECHANISM FOR LOOMS. GEORGE W. STAFFORD and SAMUEL B. BARNEY, Providence, R. I., assignors to the George W. Stafford Manufacturing Company, same place. Filed Oct. 11, 1887. Serial No. 252,257. (No model.)

Brief.—The rear ends of the lifter-bars have more movement than the front ends, and consequently impart increased movement to the rear heddle-frames. The faces of the step-bars are inclined to avoid lost motion, and the faces are formed as a series of steps to avoid the crowding together of levers. A pressure-plate and wire is used for each latch-lever.

Claim.—1. The lifting-wire *a*, having an open loop on its upper end and its lower end plain, in combination with plate-lever F, racks N N', having projections *d*, and cross-wire *r*, substantially as and for the purpose set forth.

2. The combination of the pattern-cylinder R, ratchet-wheel H, pawl-bar K, handle Z, having the curved finger, and the pawl O, with mechanism to operate pawl-bar K, substantially as described, and for the purpose specified.

388,318.

3. The combination, with the levers C, jack-levers D, latches E E', lifters S S', and means for actuating said lifters, of the step-bars P P' having their inner surfaces inclined, as described, substantially as and for the purpose specified.

4. The combination of the levers C, jack-levers D, latches E E', and lifters S S', with a pivotal shaft, T, levers B B', links Y, connecting the opposite ends of the lifters to the said levers B B', the link Y intermediate the rear end of the lifter S and the upper end of the rear lever, B', being connected with the said lever B' at a greater distance from the pivotal shaft than the link Y connecting the forward end of said lifter with the upper end of the lever B, and the step-bars P P', having their inner surfaces parallel to the axis of the shaft T, substantially as and for the purpose set forth.

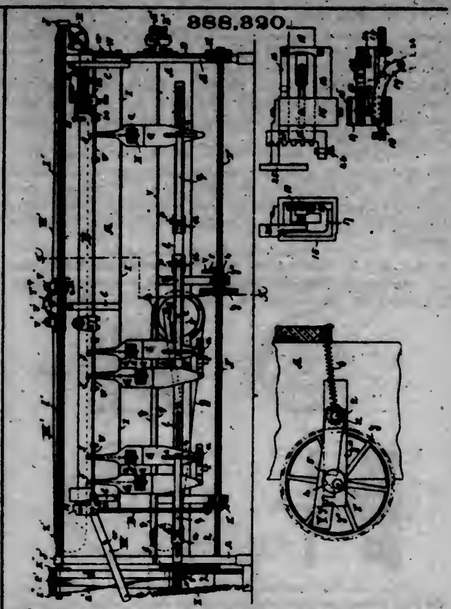
388,319. HARNESS-REPAIRING REVIVE FOR LOOMS. GEORGE W. STAFFORD and SAMUEL B. BARNEY, Providence, R. I., assignors to the Geo. W. Stafford Manufacturing Company, same place. Filed Oct. 31, 1887. Serial No. 253,897. (No model.)

Claim.—The combination, with the frames A, cross-bars N N', and shaft D, of a series of levers, B B', placed side by side on said shaft, every alternate lever being extended out beyond the shaft to receive the connections of an upper series of springs, C, and the intermediate levers having catches J on their under sides between the shaft D and their ends, to hold connections for a lower series of springs, C', and the springs C C', substantially as and for the purpose set forth.

388,320. WOOD-WORKING MACHINE. SAMUEL F. TROTTER, Biddeford, Me. Filed June 4, 1888. Serial No. 275,551. (No model.)

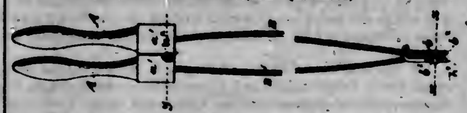
Claim.—1. The cutting-tool J, to which a rotary motion is imparted, in combination with the tool-holder G, supported by a block, H, adjustable on the plate I in front of the machine, an oscillating motion being imparted to the tool-holder G, substantially as shown and described.

2. The tool-holders G, carrying rotating cutting-tools J, in combination with bars *g*, sliding blocks *n*, sliding bar *l*, bar *k*, and disk *j*, mounted upon shaft *i*, that also carries drum *h*, driven by belt *g*, for imparting a horizontal oscillating motion to the tool-holders, substantially as shown and described.



3. The oscillating tool-holders G, supported by blocks H, adjustable on plate I in front of the machine and carrying rotating cutting-tools J, in combination with the pulleys K, belts Q, drums L, mounted in frames M, belt A', tightening-pulley B', and pulley B, for imparting a rotary motion to the cutting-tool J, substantially as shown and described.

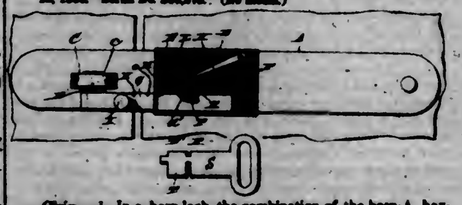
4. The angle-iron table S, working in guides C, in combination with bar D, arms E, mounted upon shaft F, to which an intermittent rotary motion is imparted for lowering the table, and levers W and springs X, for returning the table to its normal position, substantially as shown and described.



5. The pinion *x*, mounted on shaft Z, to which a rotary motion is imparted, in combination with the lever Y, provided with recess *y'*, and pin *b'*; bar *y''*, provided with a pin, *y'''*, and eccentric *b* on shaft F, and spring 6, for throwing the pinion *x* into and out of gear with the wheel *y* on shaft F, substantially as shown and described.

6. The clamping device consisting of a rectangular piece, 15, hollow block 16, with a space, 17, between, to fit onto the angle-iron table S, and a slide, 18, provided with an arm, 19, for attachment to a lever fulcrumed at 20, the front end of the slide being provided with a toothed plate, 21, substantially as shown and described.

388,320.



388,321. TRANSPLANTER. CHRIST B. TOBEY, Artondale, Ark. Filed May 26, 1888. Serial No. 275,153. (No model.)

Claim.—Tongs for planting sweet-potato sprouts and cuttings, which consist of the handles A A, pivoted near their front ends, and the spring-wires B B', the latter made with the stub *b*, slot *b'*, jaws *b²* *b³*, and side loop, *b⁴*, substantially as shown and described.

388,322. HASP-LOCK. LUTHER TRAPER, Girard, Ill. Filed Jan. 10, 1888. Serial No. 260,576. (No model.)

Claim.—1. In a hasp-lock, the combination of the hasp A, having a notch, B, the lock-case mounted on the hasp, the notched bolt operating in the case and adapted to close the said notch in the hasp, and the spring-actuated latch engaging in the notches of the bolt to lock it in any desired position, substantially as specified.

2. In a hasp-lock, the combination of the hasp having a notch in its free end, the bolt having the shouldered notch M and the outer notch, N, and the spring-actuated latch adapted to engage in either of these notches, substantially as and for the purpose hereinbefore specified.

3. In a hasp-lock, the combination of the hasp having a notch, B, engaging a pin, the bolt G, having the shouldered notch M, the outer notch, N, and the intermediate notch, O, and the latch engaging in either of the said notches, substantially as specified.

4. In a hasp-lock, the combination of the hasp A, having the notch B, the case D, disposed thereon and having a key-slot, *d*, in the outer end, the pins E and F, engaging the case to secure it in place on the hasp, the bolt G, having one or more notches, and the shouldered notch P within the case, the hold or handle I on the bolt, the spring-actuated latch engaging in either notch, and the key to raise the latch out of engagement and release the bolt, substantially as and for the purpose specified.

5. In a hasp-lock, the combination, with the hasp having a notch, the bolt to close the said notch, and the latch engaging in notches in the bolt, of the key, having the lateral webs T T', adapted, when turned, to engage the bolt and the latch, respectively, thereby lifting the latch and retracting the bolt, substantially as and for the purpose specified.

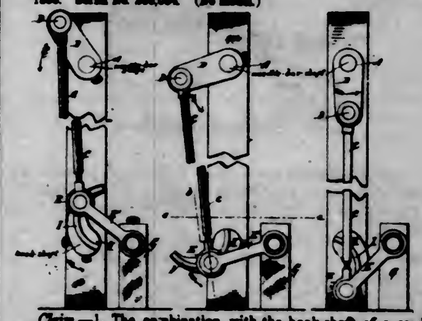
388,323. OSCILLATING HOOK FOR SEWING-MACHINES. Jasper Varney, Tiffin, Ohio, assignor of one-third to George S. Tingling, same place. Filed Oct. 27, 1887. Serial No. 253,093. (No model.)

Claim.—1. The combination of the oscillating hook, the bobbin, the bobbin-head provided with an annular flange, *c*, and the thread-guide pivoted in the recess formed by the said flange in the face of the bobbin-head and provided with a centrally-located aperture for the passage of the thread, substantially as described.

2. The combination of the oscillating hook, the bobbin-head therein and provided with a bobbin-spindle projecting from its rear face, and a rearwardly-extending flange, I, and a forwardly-extending flange, *c*, the latter forming a depression in the face of the bobbin-head, and the said flange I being smaller in diameter than the flange *c*, for the purpose described, a thread-guide pivoted to the said bobbin-head in the depression in its face, and the bobbin placed upon the said spindle and having one of its disks enlarged, the said bobbin-head being perforated at *i* for the passage of the thread, substantially as described.

3. The combination of the oscillating hook, the bobbin-head provided with a bobbin-spindle, and a rearwardly-extending flange, I, slightly smaller in diameter than the bobbin-head proper, forming a shoulder, *n*, through which a perforation, *i*, is made for the passage of the thread, the bobbin secured upon the said spindle and having one of its disks equal in size to the said bobbin, and resting on the interior surface of the oscillating hook-cylinder head, and a thread-guide, substantially as described.

4. The combination of the oscillating hook, the bobbin, the bobbin-head perforated at *g*, and provided with a pin, *g'*, projecting into the said perforation and around which the thread is passed, the said bobbin-head being also provided with an aperture, *i*, for the passage of the thread, the bobbin, and the thread-guide, substantially as described.

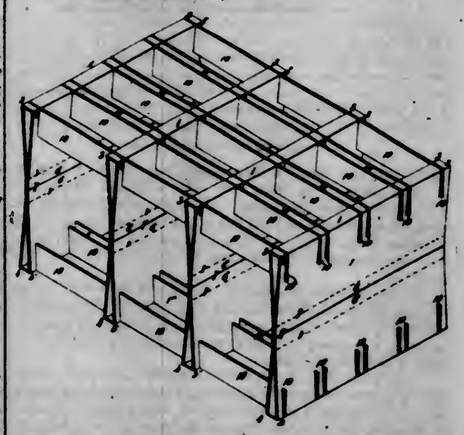


5. The combination of the bobbin-head recessed at *g*, a pin, *g'*, formed on said bobbin-head and projecting into the said recess *g* in the same, a tubular spindle projecting from the rear face of the bobbin-head, a bobbin placed upon this spindle, and a spring-actuated angular lever pivoted in the free end of this spindle and adapted to exert a forward yielding pressure upon the bobbin, whereby a variable tension is exerted upon the thread as it passes between the forward disk of the bobbin and the pin *g*, substantially as described.

6. The combination, with a bobbin-head provided with a flange, c_1 forming a depression in the face of the bobbin-head, of a thread-guide pivoted in the said depression and provided with a radial arm which engages with the said flange *c*, the thread-aperture in the said thread-guide being centrally located with reference to the bobbin-head, and a bobbin, substantially as described.

7. The combination, with the oscillating hook, bobbin-head provided with a depression in its face, and a rearwardly-extending spindle, the said bobbin-head also being provided with an opening, *g*, into which projects a bent radial pin, *g'*, a thread-guide pivoted in the said depression in the face of the bobbin-head, and being perforated centrally for the passage of the thread, the said thread-guide also having a radial arm, *c*, which serves to hold it closed, and a bobbin held upon the said spindle, substantially as described.

8. The combination of the oscillating hook, the bobbin-head placed therein and provided with a rearwardly-extending spindle, a thread-guide upon said bobbin-head, and a bobbin placed loosely upon said spindle, the forward disk of said bobbin being somewhat smaller than the bobbin-head and the rear disk being equal in diameter to the bobbin-head and adapted to rest upon the interior surface of the oscillating hook, as and for the purpose herein set forth.



388,324. SEWING-MACHINE. Jasper Varney, Tiffin, Ohio, assignor of one-third to George S. Tingling, same place. Filed Mar. 3, 1888. Serial No. 266,054. (No model.)

Claim.—1. The combination, with the hook-shaft of a sewing-machine, of a cam-arm secured to the rear thereof, an oscillating arm working on a fixed bearing, a slotted head or tumbler mounted on a pin working in a boss on said arm and riding upon the curved arm or cam, and the pitman pivoted at its lower end upon the said boss and connecting with the crank-pin of the needle-bar shaft, whereby an accelerated motion is imparted to the hook-shaft, substantially as specified.

2. The combination, with the needle-bar shaft and the oscillating hook-shaft, of the adjustable crank secured to the needle-bar shaft, the adjustable curved cam secured to the hook-shaft, the oscillating arm secured to a fixed bearing on the frame of the machine, its slotted head riding on the curved cam and the connecting-pitman, whereby the parts may be adjusted to give an accelerated movement to the hook-shaft at the proper relative positions of the crank-shaft and said hook-shaft, substantially as specified.

388,325. BOTTLE-CASE. Ross L. Walker, St. Louis, Mo., assignor of one-half to Gabriel Hoyt, Brooklyn, N. Y. Filed Jan. 30, 1888. Serial No. 262,591. (No model.)

Claim.—1. The combination, in a bottle-case, of folded partitions 1, scored at 2 3, the portions between said scores constituting the bases of triangles, and having paired slots, and cross-partitions occupying said slots, substantially as set forth.

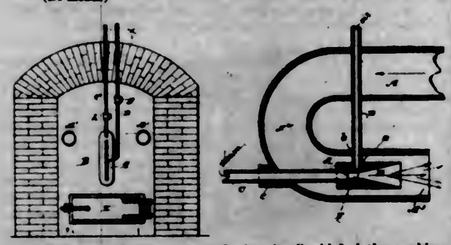
2. The combination, in a bottle-case, of hollow partitions of flexible material, each comprising a central fold and two side folds extending from the central fold, and cross-partitions, substantially as and for the purpose set forth.

3. The combination, in a bottle-case, of partitions having paired slots, said partitions being scored and folded in two places at the top and two places at the bottom, and cross-partitions occupying said slots, substantially as shown and described.

4. The combination, in a bottle-case, of slotted partitions formed of single strips of material, the longitudinal edges 6 of the strips being doubled over and secured near the middle of the strips by rows of stitching, said strips being folded in two places at top and bottom, respectively, forming a triangular space in the partition at both top and bottom, and cross-pieces occupying the slots of the partitions, substantially as shown and described.

5. The combination, in a bottle-case, of folded partitions bent in two places at their slotted tops and bottoms, and having their folded longitudinal edges 6 secured to the middles of the strips of which the partitions are made by rows of stitching, and paired cross-pieces occupying the said slots of said partitions, substantially as and for the purpose set forth.

388,326. PAPER-HOLDER FOR DUPLICATING DEVICES. Robert J. Wallace, Denver, Colo. Filed July 16, 1887. Serial No. 244,304. (No model.)



Claim.—1. The paper-holder consisting of the supporting-frame, the supports for the paper at either end, the paper passing about said supports as a band, the said supports being arranged in the extreme lower portion of said frame and in the same plane, whereby they form bearing-supports for the frame and bring the paper into close and proper position to the supporting-surfaces, substantially as described.

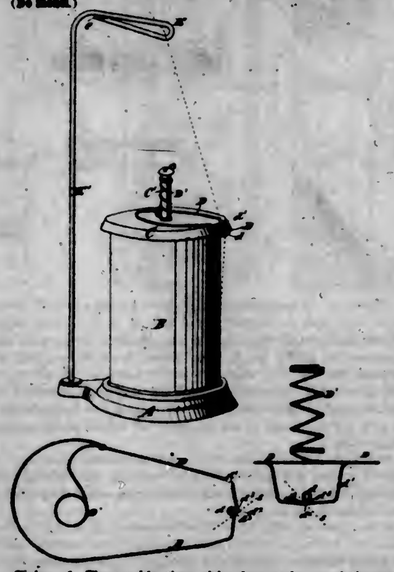
2. In combination, a paper-holder consisting of a suitable frame, the plate *c* and the roller at either end thereof, and the paper encircling said rollers and plate in the form of a belt, substantially as described.

3. The paper-holder consisting of the supporting-frame, the support for the paper at either end of said frame, the thumb-socket arranged upon the supporting-frame, substantially as described.

4. In combination, the paper-holder consisting of the supporting-frame; the support for the paper at either end of said frame, the paper arranged about said supports in the form of a belt, and the thumb-socket upon the frame arranged diagonally thereof, substantially as described.

388,327. APPARATUS FOR BURNING LIQUID AS A FUEL. Alfred Wilkie, Toledo, Ohio. Filed May 26, 1887. Serial No. 239,691. (No model.)

Claim.—1. In an apparatus for burning liquid fuel, the combination, with a combustion-chamber, of an air-pipe starting from a point near the rear end of the chamber and terminating in a downwardly and rearwardly projecting discharge end, the latter being below the main body of the pipe, whereby the latter is subjected to the direct heat of the burning fuel, a lateral branch pipe for supplying air to said pipe, a mixing-nozzle located within the discharge end of the pipe, and steam and oil pipes discharging into said nozzle, substantially as set forth.

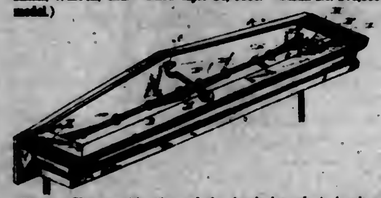


2. In an apparatus for burning liquid fuel, the combination, with a combustion-chamber, of a central air-induction pipe located within the combustion-chamber and having branches extending parallel to the central pipe to receive air at the front end of the combustion-chamber and discharge it into this chamber hot, a mixing-nozzle located in the air-pipe near the the discharge end thereof, and steam and oil pipes discharging into said nozzle, substantially as set forth.

3. In an apparatus for burning liquid fuel, an air-induction pipe having a cylindrical straight body and a lateral branch pipe that extends parallel to this main pipe, the cylindrical straight body or center pipe curving downwardly to discharge its heated contents below the main pipe and its lateral branch, a mixing-nozzle located within the discharge end of the pipe, and steam and oil pipes discharging into said nozzle, substantially as set forth.

4. In an apparatus for burning liquid fuel, an air-induction pipe having a central cylindrical body and two lateral branches resting in the same plane as the central pipe, the center pipe curving downwardly and rearwardly to enter the combustion-chamber below the three parallel portions of this air-induction pipe to discharge its contents, a mixing-nozzle located within the discharge end of the pipe, and steam and oil pipes discharging into said nozzle, substantially as set forth.

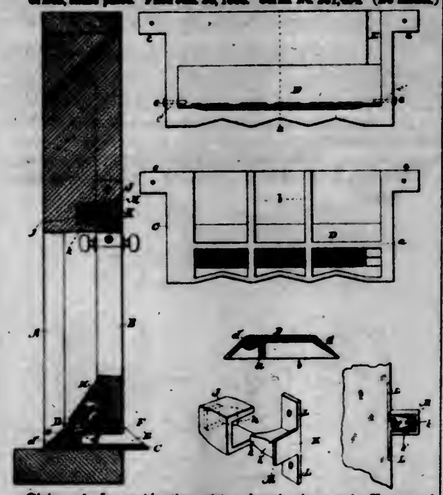
5. In a furnace for burning oil as a fuel, the combination, with the combustion-chamber, of the furnace and the central air-pipe having two lateral branches, the central pipe being curved at its discharging end, of a mixing-nozzle attached to oil and steam pipes, through which oil and steam are discharged through the moving column of hot air into the combustion-chamber.



388,328. THREAD-UNWINDER FOR SEWING-MACHINES. Chas. E. Wilkinson, Matteawan, N. Y. Filed Feb. 3, 1888. Serial No. 262,861. (No model.)

Claim.—1. The combination, with a base and a spool thereon, of a cap applied to the upper end of the spool, an upper thread-guide above the spool, and a flier, D, formed of wire and having at the outer end an inward bend forming the thread-eye *d*, and the overlapping portions d^3, forming between them an opening, d^2, through which the thread from the spool may be entered laterally into the said eye, substantially as herein described.

2. In an unwinding attachment for spools, the combination, with the cap, of the flier pivoted to the said cap with one end and projecting with its opposite end beyond the periphery of the cap and formed with the downward bend, which terminates in an inward-projecting eye completely surrounding the thread passed vertically therethrough, and overlapping portions, as d^3, one arranged above the other to form an opening, as d^2, whereby the thread may be laterally passed through said opening into the eye, substantially as set forth.



388,329. HANGER FOR WINDOW-CURTAINS. Charles A. Williams, Warren, Ind. Filed Apr. 16, 1888. Serial No. 270,998. (No model.)

Claim.—The combination of the back board, A, having screw-eyes D C D, the removable cornice-frame having pins E E and hook-

ing device F, the hooked and removable hanger-rod G, the locking-screw K, and the screw-eyes N N, adapted to guide the curtain-cords M, all constructed and combined to operate substantially in the manner and for the purpose herein shown and set forth.

388,830. COMBINED THRESHOLD AND WEATHER STRIP. GEORGE R. WILLIAMSON, Braidwood, Ill., assignor of one-half to Hattie Grimm, same place. Filed Jan. 30, 1888. Serial No. 261,694. (No model.)

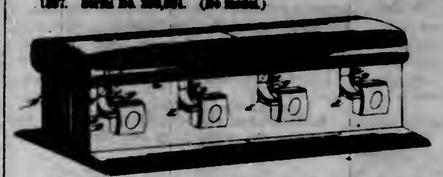
Claim.—1. In combination with a door having a strip, H, secured near its base, and an inclined flexed shoe, F, at its bottom edge, a threshold made in one piece, having a longitudinal recess in its upper side, a strip, D, having an inclined projection on the bottom side, wherewith the said shoe engages, and pivot-pins *c*, secured in each end of the strip D and passing through the ends of the threshold, said strip D occupying said recess, whereby its upper side is adapted to lie flush with the upper side of the threshold, all substantially as shown and described.

2. A hollow threshold having a recess in its top opening into the hollowed portion, a longitudinal rib between the sides of the recess, transverse ribs, and a strip pivoted in said recess and resting upon the ribs, substantially as set forth.

3. A hollow threshold having a longitudinal rib, *e*, near its front edge, a strip having a rounded edge bearing between said rib and the front of the threshold and rounded bearings in the latter, in combination with the door having a strip near its base under which said strip is adapted to fit, substantially as set forth.

4. In combination with a strip pivoted to the threshold of a door, the door having an inclined strip secured near its base, means for forcing the strip of the threshold into the recess behind the strip of the door, and a guide on the door adapted to fit in a socket in the door-frame, substantially as and for the purpose set forth.

5. In combination with a strip pivoted to the threshold of a door, the door having an inclined strip secured near its base, means for forcing the strip of the threshold into the recess behind the strip of the door, a guide-piece on the door having inclined sides, and a socket in the door-frame complementary thereto, substantially as and for the purpose set forth.



388,831. SEED-PLANTER. FRANK W. ATHEY, Stanton County, assignor of one-half to William W. Ayers, Dermot, Kans. Filed Dec. 13, 1887. Serial No. 257,736. (No model.)

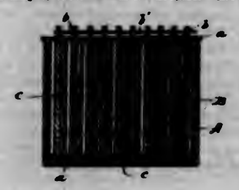
Claim.—1. The combination, in a seed-planter, with the frame A, suitable furrow-openers, D D, and coverers E E, of the loose ground-wheels C C, axle B, ratchet-wheel *b*, pawls *c c*, bevel gear-wheel 1, adjustable bevel gear-wheel 2, short vertical shaft 3, disk 5, and foot-lever *l*, all constructed and arranged as described, for the purpose specified.

2. In a seed-planter, the combination, with the short vertical shaft 3, of the seed-disk 5, secured to the top thereof and having openings 6 therein, removable and adjustable plates 7, having perforations 8 therein, with lip 9, and seed-hopper F, having a narrow bottom and A-shaped partition, substantially as described, for the purpose specified.

388,832. NUT-LOCK. GEORGE H. BALDWIN, Bowers, Mich., assignor of one-half to Lewis Zimmerman, same place. Filed Dec. 31, 1887. Serial No. 259,591. (No model.)

Claim.—In a nut-lock, the combination of the nuts, the fish-plate having a socket-groove in its upper edge which rests against the rail's heads, and recesses extending downwardly and outwardly from said groove on the side of the adjacent nuts toward which the latter unscrew, and the locking-dogs provided with journals at their tops resting in said groove, and arms extending downward in the recesses and lying against the edges of the corresponding nuts, substantially as specified.

388,833. TELEGRAPH-RECEIVER. WILLIAM T. BARNARD, Baltimore, Md. Filed Apr. 20, 1887. Serial No. 235,033. (No model.)



Claim.—The combination, with a vibrating fork, of a resonant body upon which the fork acts mechanically to produce the signals, and adjusting devices whereby the resonant body may be adjusted so as to be struck by the vibrating fork when vibrating at its full normal speed, whereby the effects of induction may be avoided, substantially as described.

388,834. TOOL-HOLDING BOX. GEORGE H. BARTLETT, Short Hills, N. J., and OTHO PEAK, Dover, Mass.; said Peak assignor to said Bartlett. Filed Feb. 9, 1888. Serial No. 263,504. (No model.)

Claim.—As a novel article, a tool holder or receptacle consisting of two exterior slabs or layers grooved upon their inner faces and one or more intermediate layers grooved upon both faces, said layers being secured together with the grooves therein opposite each other to form a series of compartments or cells, a bottom secured to the lower end of the slabs or layers, and a cover connected with the upper or opposite ends thereof, said cover being recessed in its inner face to receive the ends of tools which project from the recesses, substantially as described.

388,835. SECONDARY BATTERY. JOHN BEATTIE, Jr., Westport Mass. Filed May 2, 1887. Serial No. 236,833. (No model.)

Claim.—1. In a secondary battery, a plate composed of lead and an amalgam of any metal except lead in combination with a plate composed of zinc and an amalgam of any metal except zinc, for the purpose set forth.

2. In a secondary battery, a plate amalgamated throughout its entire body with an amalgam of lead and any other metal except lead in combination with a plate amalgamated throughout its entire body with an amalgam of zinc and any metal except zinc, substantially as set forth.

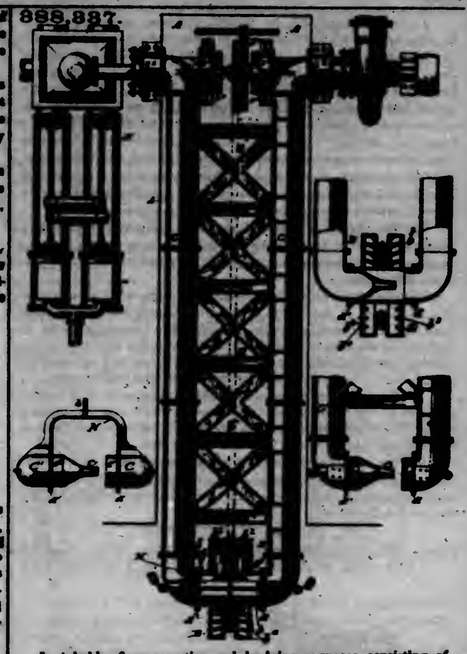
3. In a secondary battery, a lead plate consisting of an amalgam of lead, arsenic, sodium, and mercury, in combination with a zinc plate composed of an amalgam of zinc, mercury, lead or tin, and sodium, substantially as set forth.

388,836. PROCESS OF FORMING INGOTS. JAMES B. D'A. BELL, Jersey City, N. J., assignor to the Gold Ingot Company, of New York. Original application filed Mar. 30, 1887, Serial No. 232,502. Divided and this application filed June 22, 1888. Serial No. 277,572. (No model.)

Claim.—1. The process herein described for forming a continuous ingot-bar in separable sections divided by notches, which consists, first, in filling a vertical mold-section with fluid metal; secondly, applying at the top of such filled section a packing or washer perforated to permit the passage of the metal; thirdly, superposing a bottomless mold-section, and, fourthly, filling the same with fluid metal and continuing the application of bottomless mold-sections and perforated washers at the joints of such sections as long as desired, substantially as herein set forth.

2. The process herein described for forming an ingot, which consists, first, in filling a vertical mold-section with fluid metal; secondly, applying to the top of such filled section a perforating yielding packing having its edge projected into the mold; thirdly, superposing a bottomless mold-section thereon, and, fourthly, filling the same with fluid metal, as and for the purpose set forth.

388,837. DREDGING APPARATUS. ALPHONSO B. BOWERS, San Francisco, Cal. Original application filed Dec. 5, 1870. Renewed Apr. 16, 1879. Divided and this application filed May 1, 1888. Serial No. 272,513. (No model.)



Brief.—It consists in part of an excavator of any suitable form mounted on the outer end of a ladder constructed with tubular sides trussed and bound together to give the necessary stiffness in the usual form of a dredge-ladder, each side having at its inner upper end a bearing in the same axial line with the other, on which bearings the ladder swings in a vertical plane. It consists, also, in part in utilizing the hollow sides of this ladder as conduits for conveying water and spoil, and in other details of construction, as set forth.

Claim.—1. A ladder for excavating and dredging purposes, consisting of tubular sides suitably trussed and bound together to give the necessary rigidity and mounted on trunnions to swing in a vertical plane, one of these sides being utilized as a suction-pipe and the other as a force-pipe, through which water is injected into the suction-pipe.

2. In combination, a ladder for excavating and dredging purposes, consisting of tubular sides suitably trussed and bound together to give the necessary rigidity and mounted on trunnions to swing in a vertical plane, one of these sides being utilized as a suction-pipe and the other as a force-pipe, through which water is injected into the suction-pipe, and an excavator constructed and arranged to deliver its spoil to said suction-pipe.

3. In combination, a ladder for excavating and dredging purposes, consisting of tubular sides suitably trussed and bound together to give the necessary rigidity and mounted on trunnions to swing in a vertical plane, one of these sides being utilized as a suction-pipe and the other as a force-pipe, through which water is injected into the suction-pipe, and a rotary excavator constructed and arranged to deliver its spoil to said suction-pipe.

4. In combination, a ladder for excavating and dredging purposes, consisting of tubular sides suitably trussed and bound together to give the necessary rigidity and mounted on trunnions to swing in a vertical plane, one of these sides being utilized as a suction-pipe and the other as a force-pipe, through which water is injected into the suction-pipe, and a hollow rotary excavator with inward delivery through itself to said suction-pipe.

5. A ladder for excavating and dredging purposes, consisting of tubular sides suitably trussed and bound together to give the necessary rigidity, and mounted on trunnions to swing in a vertical plane, one of these sides being utilized as a receiving and discharging pipe and the other as a force-pipe, through which water is injected into said discharge-pipe.

6. In combination, a ladder for excavating and dredging purposes, consisting of tubular sides suitably trussed and bound together to give the necessary rigidity, one of these sides being utilized as a receiving and discharging pipe and the other as a force-pipe, through which water is injected into the discharge-pipe, and an excavator constructed and arranged to deliver its spoil to said receiving and discharging pipe.

7. In combination, a ladder for dredging purposes, consisting of tubular sides suitably trussed and bound together to give the necessary rigidity, one of these sides being utilized as a receiving and discharging pipe and the other as a force-pipe, through which water is injected into the discharge-pipe, and a rotary excavator constructed and arranged to deliver its spoil to said discharge-pipe.

8. In combination, a ladder for excavating and dredging purposes, consisting of tubular sides suitably trussed and bound together to give the necessary rigidity, one of these sides being utilized as a receiving and discharging pipe and the other as a force-pipe, through which water is injected into the discharge-pipe, and a rotary excavator with inward delivery through itself to said discharge-pipe.

9. A swinging ladder for dredging purposes, consisting of hollow or tubular sides suitably trussed and bound together to form a rigid structure and mounted on hollow trunnions, on which it swings in a vertical plane, one of the sides being utilized as a suction-pipe and communicating through its hollow trunnion, and a suitable connection with a suction-pump capable of raising and discharging spoil, the other side communicating through its hollow trunnion with the discharge of a force-pump and serving as a conduit through which water may be injected into the suction-pipe.

10. A swinging ladder for dredging purposes, consisting of hollow or tubular sides suitably trussed and bound together to form a rigid structure and mounted on hollow trunnions, on which it swings in a vertical plane, one of these sides being utilized as a suction-pipe and communicating through its hollow trunnion and a suitable connection with a suction-pump capable of raising and discharging spoil, the other side communicating through its hollow trunnion with the discharge of a force-pump through which water may be injected into the suction-pipe, in combination with elbows on the lower ends of said hollow sides, forming continuations of said pipes, the force-pipe being provided with an injection-nozzle through which water is forced into the mouth of the suction-pipe.

11. A swinging ladder for dredging purposes, consisting of tubular sides suitably trussed and bound together to form a rigid structure and mounted on hollow trunnions, on which it swings in a vertical plane, one of these sides being utilized as a suction-pipe and communicating through its hollow trunnion and a suitable connection with a suction-pump capable of raising and discharging spoil, the other side communicating through its hollow trunnion with the discharge of a force-pump through which water may be injected into the suction-pipe, in combination with elbows on the lower ends of said hollow sides, forming continuations of said pipes, these elbows being provided with bearings forming journals for the support of a hollow rotary excavator with inward delivery through itself to the suction-pipe.

12. The combination, in a device for raising spoil, of a rotary excavator provided with cutting edges or blades, a suction pipe and pump, and an injection-pipe through which water may be forced into said suction-pipe.

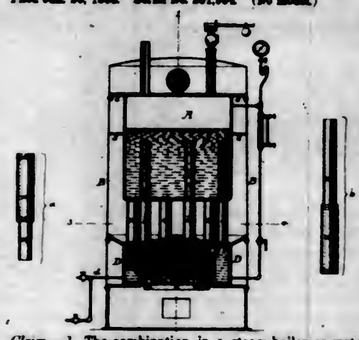
13. The combination, in a device for raising spoil, of a suction pipe and pump, an excavator having a cutting-edge or cutting-edges constructed and arranged to work with a side feed or swing of the ladder in lateral planes from side to side across the longitudinal axis of the excavation and deliver its spoil to this pipe, and an injection-pipe through which water may be forced into said suction-pipe.

14. The combination, in a device for raising spoil, of a suction pipe and pump, a rotary excavator provided with axial excavating-blades that deliver its spoil to this pipe, and an injection-pipe through which water may be forced into said suction-pipe.

15. The combination, in a device for raising spoil, of a suction pipe and pump, a rotary excavator with inward delivery through itself to this pipe, and an injection-pipe through which water may be forced into said suction-pipe.

388,338. **FENCE.** JESSE BESSEY, Lewisburg, W. Va. Filed June 2, 1888. Serial No. 275,881. (No model.)

Claim.—1. In a fence, the inner crossed stakes, A A, connected at their intersection by a suitable tie-wire, *a*, the outer crossed stakes, C C, arranged, respectively, parallel with the rails A and connected at their upper intersecting ends by the tie-wire *d*, the said outer stakes being connected to the inner stakes at their points of intersection by the tie-wires *e e*, in combination with the upper or rider rail arranged in the angle between the upper ends of the outer stakes, the intermediate rail arranged in the upper angle formed by the intersection of the inner stakes, and the lower rails, E E, arranged between the adjacent sides of the parallel stakes and bearing on the tie-wires *e e*, which connect the said stakes, substantially as specified.



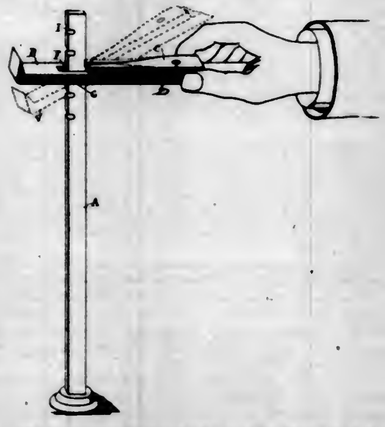
2. In a fence, the inner and outer crossed stakes, A A and C C, respectively, connected at their intersections by suitable tie-wires, and the upper and intermediate rails, D and B, respectively arranged in the angles formed by the intersections of the said rails A A and C C, in combination with the parallel horizontal rails E E, arranged side by side below the intermediate rails and secured at their ends between the adjacent lower ends of the said stakes, whereby the bottom of the fence is fortified against the attacks of confined animals, substantially as specified.

388,339. **FOOD FOR CATTLE.** GUSTAF A. BRINK and ALBERT V. RENSTRÖM, Stockholm, Sweden. Filed May 17, 1888. Serial No. 274,170. (No specimens.)

Claim.—1. The herein-described composition of matter as a food for cattle, the same consisting of dried skim-milk curds, (casein,) cereal-meal, and oil-cake, as set forth.

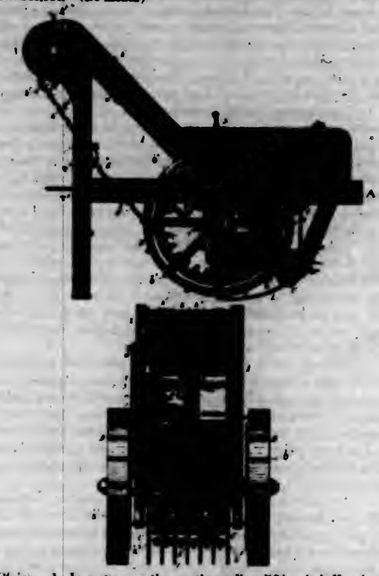
2. As an improved food for cattle, a cake or solidified mixture of dried skim-milk curds, (casein,) cereal-meal, oil-cake, and bone-meal.

388,340. **STEAM-BOILER.** JAMES G. BRYAN, Philadelphia, Pa. Filed Jan. 26, 1888. Serial No. 261,964. (No model.)



Claim.—1. The combination, in a steam-boiler or water-heater, of the water-vessel, the annular water-jacketed fire-pot, and pipes *a* and *b* extending between the vessel and water-jacket, said pipes *b* projecting upward in the water-vessel and the pipes *a* projecting down into the water-jacket, all substantially as specified.

2. The combination of the water-vessel, the fire-pot beneath the same, an outer casing, and horizontal partitions having openings on opposite sides of the axis of the water-vessel, whereby the products of combustion are caused to circulate beneath, around, and above said vessel, all substantially as specified.



3. The combination of the water-vessel, the water-jacketed fire-pot and connecting-pipes, each comprising two portions, one larger in diameter than the other, the larger portion having right and left screw-threads adapted to openings in the casings of the water-vessel and jacket, all substantially as specified.

388,341. **WAGON-JACK.** JOHN A. COREY, Rockville, assignor of one-half to Charles D. Chase, Shannock, R. I. Filed Feb. 4, 1888. Serial No. 262,862. (No model.)

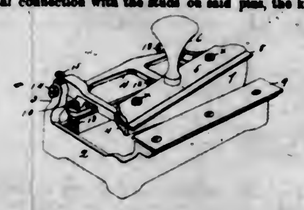
Claim.—The standard A, having a series of recesses in its edge, in combination with the lever B, made with the mortise and pin, and the swinging latch C, pivoted to said lever, substantially as and for the purpose set forth.

388,342. **SELF-LOADING STONE-GATHERER AND POTATO-DIGGER.** HENRY CRANE, Addison, N. Y. Filed Aug. 31, 1887. Serial No. 248,208. (No model.)

Claim.—1. In a stone-gatherer, the endless lifting-belt K, adapted for lifting a mass of stones, composed of a series of long metal plates extending across the machine and provided with lifting-teeth curving forward and hooked together, as described, to form a continuous compact bed for supporting and carrying up the stones, and having but a narrow space between the plates for the escape of dirt, such belt extending from end to end of the swinging elevator-frame, all substantially as shown and described.

2. The described means for lifting the pinion-shaft to raise its gear or pinion D out of engagement with the internal gear C, consisting of the combination of the movable shaft E, hinged lever *c*, bent lever 4, and link 3, all as shown and described.

3. In combination, the frame A, the side pieces, U U, secured thereto, the arched plate or cover R, and lifting devices, as described, connected to hooks *p*, extending from the rake-head through such cover.



4. In combination, the driving-gear C, the endless chain K, operated by a gear-shaft, E, which is adapted to be lifted to take its gear D out of engagement with the driving-gear, and the rake-teeth L, also adapted to be lifted and held in their raised position.

5. In combination, the stone-gathering chain K, constructed as described, its supporting-frame, shaft E, its gear D, and sprocket-wheels H, ratchet *g*, and spring-pawl *e f*, the combination serving to arrest the working of the chain when the machine is backed, all substantially as shown and described.

6. In combination with the two-wheeled chain-carrying frame having its preponderance of weight forward of the axle, the adjustable post V, held in guides on the frame and adapted to slide thereon and to be secured at any desired portion, as and for the purposes set forth.

388,343. **ENVELOPE-OPENER.** FRANCIS CURTIS, Springfield, Mass. Filed Mar. 7, 1887. Serial No. 230,094. (No model.)

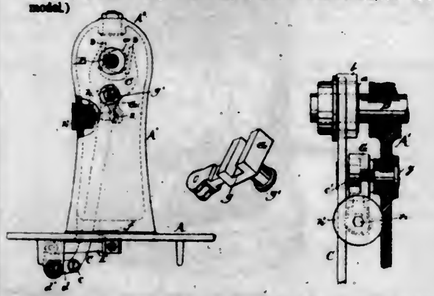
Claim.—1. The bed 2, having the posts 3 thereon, the eccentrically-studded pins 14, passing through said posts, the knife-frame having a pivotal connection with the studs on said pins, the knife 8, attached to said frame, and the cutter-plate 9, attached to the bed opposite said knife, combined and operating substantially as set forth.

2. An envelope-opener consisting of the bed 2, having a box form, as described, and the posts 3 thereon extending above the border of said bed, the cutter-plate 9, secured on the latter, the knife-frame 4, having a pivotal connection with said posts, the knife 8 and the gage 7, attached to said knife-frame, the adjusting-screws 16, engaging with the rear edge of said knife, the screw 10, engaging with said frame and bed, and the spring 13, combined and operating substantially as set forth.

3. In combination, the knife-frame 4, having the grooves *s s* therein, the knife-clamp 5, the gage 7, having arms thereon entering said grooves, and the screws 17, passing through said frame against said arms.

388,344. **CIRCUIT-CLOSER FOR CALL SYSTEMS.** CHARLES R. DEY, Denver, Colo. Filed Apr. 19, 1887. Serial No. 236,342. (No model.)

Claim.—1. The combination, in an electric call, of spring-actuated push-pins, a movable frame engaged to said pins, and two cam-shafts provided with connecting-rods, substantially as specified.



2. The combination, in an electric call, of slotted spring-actuated push-pins, a movable frame engaged to said pins, and two cam-shafts and connecting-rods for actuating said frame and pins, substantially as described.

3. The combination, in an electric call, of the inclosing-casing having a series of circuit-closers at its back, the partition at the rear of said casing, the shouldered push-pins and springs, a movable frame engaged to said pins, substantially as described.

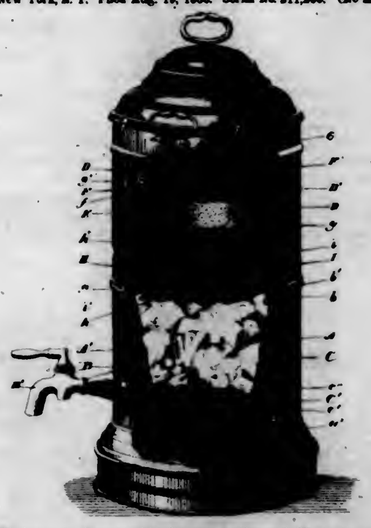
4. The combination, in an electric call, of spring-actuated push-pins, a series of circuit-closers, a movable frame, cams, and connecting-rods for actuating said frame, substantially as specified.

5. The combination, in an electric call, of spring-actuated push-pins, a series of circuit-closers, a movable frame, cams provided with a handle, and connecting-rods, substantially as described.

388,345. **FEEDING MECHANISM FOR SEWING-MACHINES.** PHILIP DIEHL, Elizabeth, N. J., assignor to The Singer Manufacturing Company of New Jersey. Filed July 1, 1886. Serial No. 206,810. (No model.)

Claim.—1. The rotating needle-bar-actuating shaft located in the overhanging arm of the machine, a cam or eccentric thereon, the rocking shaft located below the cloth-plate, the feeding bar or device jointed to an arm of the said rocking shaft, and the link C, bifurcated or forked at its upper end to embrace the said cam or eccentric, the said link having a stud at one side and jointed at its lower end to an arm secured directly to the said rocking shaft, combined with the independent pivoted feed-regulating lever G, having a slotted or grooved way therein to co-operate with the said stud, and a device to move the said lever, the said rotating shaft moving the upper end of the link

about its pivot or fulcrum, the pin *c'*, and causing the said link to be moved longitudinally a greater or less distance according to the position of the slot or groove of the regulating-lever, substantially as described.



2. The rotating needle-bar-actuating independent shaft, its cam or eccentric, the feeding-bar, the rocking shaft D, having arms to which it is jointed, and the link C, forked at its upper end to embrace the said cam or eccentric and jointed at its lower end directly to an arm of the said rocking shaft and having at one side a roller-stud, combined with the independent pivoted feed-regulating lever grooved or slotted at one side to receive the stud of the lever C, the screw-rod attached to the regulating-lever, and the internally and externally threaded nut *h'*, by which to adjust the said lever, substantially as described.

388,346. LIGHTING DEVICE FOR TOILET-MIRRORS. Howard S. Duff, Philadelphia, Pa. Filed Oct. 25, 1887. Serial No. 253,227. (No model.)

Claim.—The combination of the mirror F, having opposite projecting trunnions *b*, the central supporting-post, A, constituting a socket for application to a gas-burner, the branches B, spreading laterally from the upper end of said post to receive between them the lower portion of the mirror, and having sockets *d* for the reception of the trunnions, wings D, extending laterally beyond the mirror and terminating in burners *a*, substantially as described.

388,347. WATER COOLER AND FILTER. James H. Dumont, New York, N. Y. Filed Aug. 19, 1886. Serial No. 211,269. (No model.)

Claim.—1. In a combined water cooler and filter constructed substantially as shown, an ice-receptacle adapted to be suspended within the chamber for the filtered water, said ice-chamber having a filter or strainer, whereby the impurities which may be in the ice are prevented from entering the chamber for the filtered water, substantially as shown, and for the purposes set forth.

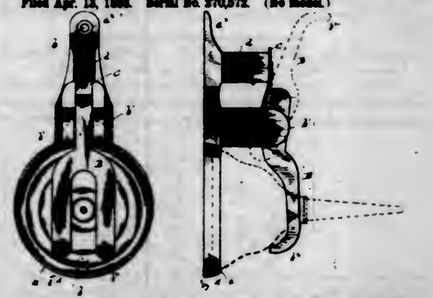
2. The combination, in a combined water cooler and filter, of an ice-chamber adapted to be suspended below the filter and within the chamber for the filtered water, said ice-chamber being provided at its upper edge with a projecting flange and with a depending bottom portion with perforations, a covering therefor of textile fabric, and a perforated disk for holding said fabric in place, substantially as shown.

3. In a combined water cooler and filter, a lower vessel provided with interior and exterior walls, so as to provide an air-space between the same, the interior walls constituting a vessel for the filtered water, said vessel having a horizontal portion, *b*, and a vertical portion, *b'*, formed integral therewith, which extends above the upper edge of the lower vessel, in combination with the portion *b'* of the filter, and an ice-receptacle having at its upper edge an outwardly-projecting flange which engages with the portion *b*, so as to support the same within the chamber for the filtered water, substantially as shown.

4. In a combined water cooler and filter, an upper vessel having a partition-plate, so as to form a chamber for the unfiltered water, said partition having an opening within which is secured a filtering-vessel and an upwardly-projecting wall for maintaining an imperforate covering-plate in position, a pan supported under said filtering-vessel by means of a frame, and an ice-receiving receptacle adapted to occupy a position in the lower portion of the filter, the parts being combined and organized substantially as shown.

5. A combined water cooler and filter comprising a receptacle for the unfiltered water, the bottom thereof having a central opening within which is secured a filtering-vessel, the upper edge of said vessel being surrounded by a primary strainer, a chamber for the filtered water, and an ice-receptacle suspended within the chamber for the filtered water, said ice-receptacle having a strainer, the parts being combined substantially as shown.

6. In combination with a water cooler and filter, a chamber, D, provided with a transverse partition having a central opening therein, an upwardly-projecting flange attached at intervals to said partition, so as to provide a passage-way beneath the same, a vessel maintained by said partition so that the upper edge will extend above the partition, and a cap adapted to fit over the flange, and a primary strainer confined between said flanges, substantially as shown, and for the purposes set forth.

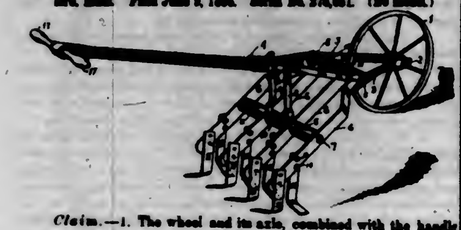


7. In a filter, a removable ice-receptacle adapted to be supported within the chamber containing the filtered water, consisting of the side walls provided at their upper edges with an outwardly-projecting flange and at the base thereof with a depending portion having a perforated bottom, a perforated covering-plate provided with a handle, and one or more layers of textile fabric interposed between the bottom and covering-plate, the parts being organized substantially as shown.

8. In a combined water cooler and filter, a base comprising an exterior vessel, upon the upper edge of which is formed a bead, *a*, a vessel for filtered water attached thereto, so as to provide a dead-air space, the upper edge, *b'*, extending above the bead *a*, and a horizontal projecting portion, *b*, below the bead, a vessel provided with a flanged upper edge and a perforated bottom, and an upper vessel adapted to be supported upon the upper edge of the lower vessel, substantially as shown, and for the purpose set forth.

9. In a combined water cooler and filter, the combination of the vessel A, provided with an interior wall, which extends above the upper edge of the outer wall and is provided with a horizontal portion, and an ice-chamber provided at its upper edge with an outwardly-projecting flange, which engages with a horizontal portion of the inner wall, substantially as shown.

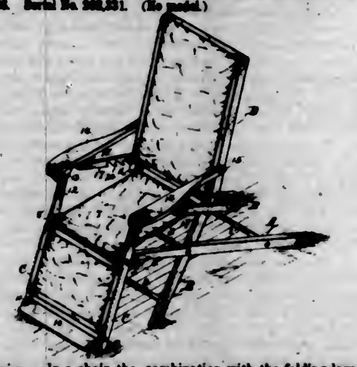
10. In a water-filter for domestic use, an upper chamber or receptacle, D, provided near its central interior portion with a transverse partition, a vessel, E, supported by said partition and provided with an upwardly-projecting portion, which extends above said partition-plate, an upwardly-projecting screw-threaded flange with downwardly-projecting feet attached to said partition-plate, and a screw-threaded cap, F, adapted to hold in place a packing placed within the upwardly-projecting flange F, substantially as shown, and for the purpose set forth.



388,348. OIL-CAN HOLDER. Elmira A. Dumont, Mitchell, Dak. Filed Apr. 13, 1888. Serial No. 270,572. (No model.)

Claim.—1. The combination, with the ring or bracket and the arm or extension, of the pivotally-secured arm having curved fingers, and coupled between posts or gudgeons of said arm or extension, and the spring secured to the post or stud and bearing against one side of said arm when the latter is lowered and against the other side thereof when raised, substantially as shown and described.

2. The herein-described improved oil-can holder, comprising the circular ring or bracket, the stationary arm or extension having the posts or gudgeons, the arm having curved fingers projecting therefrom and pivotally secured between two of said posts or gudgeons, and the spring secured to one of said posts and bearing against one side of one end of said arm when the latter is lowered and against the other side thereof when raised, substantially as shown and described.



388,349. WHEELED PULVERIZER. Bernard Blasdy, Chelmsford, Mass. Filed June 9, 1888. Serial No. 276,691. (No model.)

Claim.—1. The wheel and its axle, combined with the handle connected to said axle, the knife-carriers connected to said handle by a pivot and secured firmly together at a distance from said pivot, the knives constructed substantially as described and detachably connected to said knife-carriers, and the slotted links connecting said handle with said knife-carriers, substantially as described, and for the purposes specified.

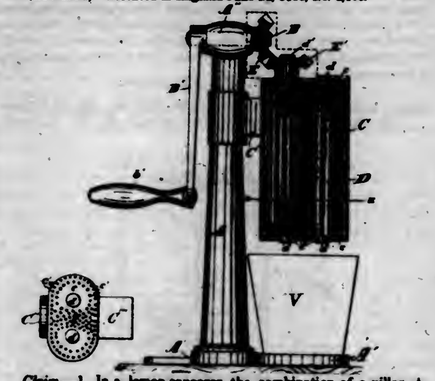
2. The wheel and its axle, combined with the handle connected with said axle, the knife-carriers connected to said handle by a pivot and secured firmly together at a distance from said pivot by a bolt, 7, the links connecting said bolt with said handle, and a plurality of sets of knives with substantially horizontal blades whose upper surfaces are inclined upwardly and backwardly, and with the forward set placed higher than the backward set, substantially as described, and for the purposes specified.

388,350. CHAIR. Eli Bellhouse, Cherokee, Iowa. Filed Jan. 30, 1888. Serial No. 262,331. (No model.)

Claim.—In a chair, the combination with the folding legs pivoted together and extended above their pivotal connection and provided with cross-bars in the ends of the said extensions, the ends of the cross-bars being projected beyond the outer faces of the extensions, the foot-rest frame having its side pieces pivoted to the projecting ends of the front cross-bar and extended above the pivotal connection, the arms pivoted at the front to the extensions of the foot-rest and at the rear pivoted to the side rails of the back, the back having the lower ends of its side pieces formed with open-end slots to rest on the extended ends of the rear cross-bar of the front legs, and the ball hinged to the under side of the arms or to back part of upper end of foot-rest frame and formed with a rack to engage the ends of the rear cross-bar, and the rear ends united by a cross-bar, all substantially as described.

388,351. BURNISHER AND SEAT-WHEEL. Alonzo C. Bovee, Camden, N. J. Filed Feb. 6, 1888. Serial No. 263,151. (No model.)

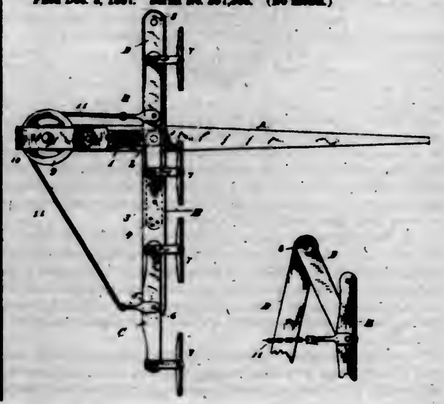
Claim.—1. A burnisher having a slotted sliding bar, a box in said slot, a spring-arm with end in said box, an inclined rider having recesses *a* and *b* and provided with an arm pivoted to the body of the burnisher, said parts being combined substantially as and for the purpose set forth.



2. A burnisher, A, with grooves G^2 in the inner wall of the body thereof, and provided with the sliding bar C, having the pins G^3, substantially as and for the purpose set forth.

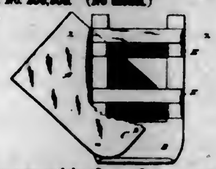
3. In a burnisher, substantially as described, the spring I, connected with the screw E and arm F, as stated.

4. In a burnisher, substantially as described, the rider or incline G, provided with a cam, G', as stated.



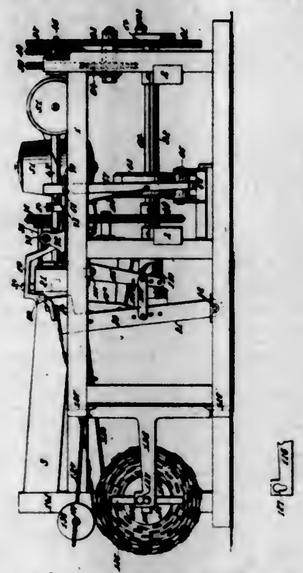
388,352. LEMON-SQUEEZER. Charles M. Postit, Marlow, County of Bucks, England. Filed Dec. 26, 1886. Serial No. 282,847. (No model.) Patented in England June 21, 1886, No. 8,179.

Claim.—1. In a lemon-squeezer, the combination of a pillar, A, provided with a base, A', and hub A'', a shaft, B, journaled in said hub, a crank, B', secured to the shaft, a casing, C, firmly secured to said pillar and provided with mouth C', spout C'', and perforated bottom *c*, the fluted rollers D, geared together and journaled in the ends of said casing, and the bevel-gears E E', connecting said shaft B and one of the rollers D, substantially as set forth.



2. In a lemon-squeezer, the combination of the casing C, secured to a stand and provided with a mouth, spout, and perforated bottom, rollers D, journaled within said casing, geared together, and having surfaces adapted to engage fruit fed between them, and gearing adapted to give motion to said rollers, substantially as set forth.

388,353. DRAFT-EQUALIZER. Matt Frahram, Cherokee, Iowa. Filed Dec. 9, 1887. Serial No. 257,306. (No model.)



Claim.—In a four-horse draft-equalizer, the combination, with the tongue A, of the lever B, pivotally mounted on the tongue with the arms two to one and provided with the strengthening-plate 3, the evener D, having its outer end pivoted to the end of the short arm of the lever, the doubletree E, pivoted to the inner or free end of the evener D, the sheave 9, mounted on the rear end of the tongue, the doubletree C, pivoted to the end of the long arm of the lever, and the cord 11, arranged on the sheave and having one end connected to the center of the doubletree on the evener and the other end connected to the clevis of the doubletree on the end of the long arm of the lever.

388,854. MATCH-BOX. Henry Gass, Mobile, Ala. Filed Dec. 3, 1887. Serial No. 256,602. (No model.)

Claim.—As a new article of manufacture, a match box or receptacle consisting of the following essential elements: the body composed of a rigid bottom piece and rigidly upwardly-extending arms, strengthening bead or beads extending transversely from arm to arm, and a lid or cover bent in U shape to fit over and envelop the body, and pivotally connected at its ends to the bottom piece, substantially as shown and described.

388,855. MACHINE FOR MAKING FENCES. Miller T. Greenleaf, Gadsey, Ill. Filed Dec. 6, 1887. Serial No. 257,138. (No model.)

Claim.—1. In a machine for making fencing, the combination, with a feed-table having parallel ledges for the support of the slats or palings, and provided with plates arranged below said ledges and beveled as described, of a feeding-frame arranged between the ledges of the table and composed of parallel bars having trunnion-pins projecting outward to engage with the beveled plates, and means for reciprocating said frame, substantially as described.

2. The combination, with a feed-table having supports upon which the ends of the pickets rest, of a feed-frame arranged beneath said supports and provided with trunnion-pins, a pitman reciprocating said frame, plates having an upward bevel at their ends and provided with notches in their adjacent edges, and descending bevels adjacent to said notches and pins, preventing longitudinal movement of said plates, substantially as described.

3. The combination, with a feeding-table having supports for the ends of the pickets, of a cross-beam arranged at a right angle to the longer sides of the feed-table, said cross-beam having a delivery-chute adapted to receive the pickets singly, and separable feed-rolls having constant rotation within said chute, substantially as described.

4. The combination, with a rectangular feed-table having one side formed by a cross-beam having a delivery-chute adapted to receive the single pickets, of separable feed-rolls revolving within said chute, and a pair of feed-rolls revolving upon shafts having rigid bearings and rotating between the delivery-chute and a channel in the cross-beam communicating with the same, substantially as described.

5. The combination, with the twisting-heads of a fence-machine, of sleeves within which the shafts of the twisters revolve, spool-cylinders mounted on said sleeves, and tension devices each composed of a divided ring; the parts thereof having apertures to receive fastening-screws by which they are united and drawn into contact with or clamped upon the sleeves, and provided also with openings for the passage of the wires, substantially as described.

6. The combination, with the twisting-heads and with sleeves mounted on the shafts thereof, of spool-cylinders mounted on and revolving with said sleeves, and tension devices having passages for the wires and clamped upon said sleeves between the spool-cylinders and the twisters, said tension devices having rotary adjustment upon the sleeves, whereby the tension is varied, substantially as described.

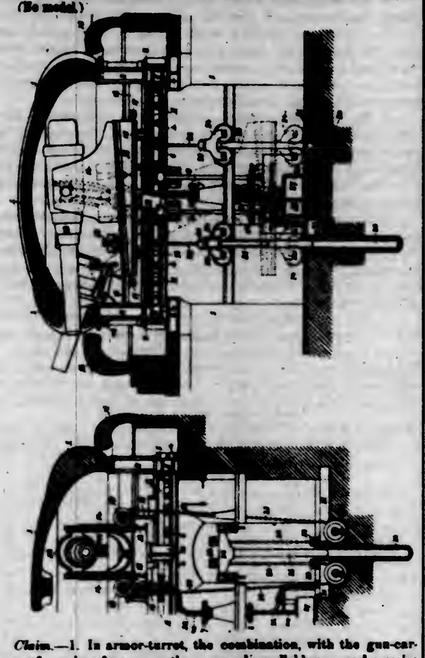
7. The combination, with the twister-shafts and the sleeves in which they rotate, of spool-cylinders carried by said sleeves, two separate trains of intermeshing pinions revolving the twister-shafts and sleeves independently, a power-gear communicating constant revolution to the sleeves, a train of pinions giving movement to the twister-shafts, two of said pinions being mounted on movable bearings linked to the bearing of the adjacent pinion, and a pitman connected to a crank-pin on the power-gear and to the journal of one of the movable pinions, substantially as described.

8. The combination, with two independent trains of gearing revolving the twister-shafts and the sleeves carrying the spool-cylinders and having adjustable tension devices, of a power-gear, a train of gears communicating constant rotation therefrom to the sleeves, and a train of gearing communicating motion to the shafts from the same power-gear, one of said gears having its journal connected by a pitman to a crank-pin on the power-gear and by a link to the journal of each of the intermeshing gears, substantially as described.

9. A take-up for fencing-machines, consisting of a central section, strips linked thereto, one upon each side thereof, one of said links near each end of the take-up being prolonged to extend through slots in one of said strips, and having the points of said prolonged ends adapted to engage the web, substantially as described.

10. A take-up for fence-machines, consisting of a flat central piece or section, strips linked thereto on opposite sides, two of said links being prolonged to extend through slots in one of said strips, a head having beveled lugs, between which one end of the central section is fastened, a removable collar having similar lugs to engage the other end of the central section, a wedge or key lying in a slot in the central section to hold the collar, and a movable bracket supporting a journal on the outer end of said section, substantially as described.

11. The combination, with a series of twisting-shafts, of a series of sleeves having rotation about said shafts and carrying spools, a power-gear, a train of gears intermediate between said power-gear and the pinions of said shafts, links connecting the journals of the adjacent gears, and a pitman driven by the power-gear and connected to the end of the journal of one of said intermediate gears, substantially as described.



12. The combination, with a main or power gear, of a train of gears driven thereby, links connecting the axis of the main gear and the movable journals of the gears in the train, a pinion on one of the twisting-shafts having a rigid bearing to which the last gear of the train is linked, a spool-carrying sleeve revolving with a constant speed about said shaft, and a connection between the main or power gear and one of the gears of the train, whereby the gear linked to the shaft of the power-gear is caused to travel back and forth upon an arc of the power-gear, substantially as described.

13. The combination, with the spacing-frame having a rack, of the auxiliary frame having a push-pawl engaging said rack, a holding-pawl adapted to trip the push-pawl when raised, a rotating disk having adjustable pins at intervals impinging on said holding-pawl, and means for vibrating the auxiliary frame, substantially as described.

14. The combination, with the vibrating spacer having a rack, of the auxiliary frame having a push-pawl engaging said rack, a holding-pawl adapted to trip the push-pawl when raised, a wheel or disk having teeth and provided with removable pins projecting from its face, a lever having one end engaged by said pins, a movable journal of one of the picket-feeding rolls raised by said lever, and a lug on the main shaft by which intermittent rotation is given to said wheel, substantially as described.

15. The combination, with the spacer having a rack and a vibrating auxiliary frame having a push-pawl, of a spring-actuated bell-crank engaging the rack, an intermittingly-rotated wheel having adjustable pins projecting from its face toward the other end of the bell-crank, a pitman having a slotted end engaging a pin on the auxiliary frame and provided with a pocket opening out of said slot, a spring on the pitman below the slotted end lying in the path of a pin on the spindle, and a take-up mechanism with which the pitman is connected, substantially as described.

888,856. OPERATING MECHANISM FOR TURRET-GUNS. Hermann Gruson, Buckau-Magdeburg, Prussia, Germany, assignor to the Grusonwerk, same place. Filed June 26, 1887. Serial No. 242,693. (No model.)

Claim.—1. In armor-turret, the combination, with the gun-carriages, of a series of permanently-arranged parallel beams and a series of laterally-arranged removable beams mounted on the parallel beams and supporting the carriages when in position for action, substantially as described.

2. The combination, in a revolvable turret having a number of guns arranged at the side of the center thereof, of a vertically-moving piston on which said guns are adapted to be placed, a cylinder formed in the bottom of the turret beneath the path of the guns, in which said piston works, and a pump for operating said piston, whereby said guns may be independently lowered below the turret and raised into operative position, substantially as described.

3. The combination, with a revolvable turret having a number of guns arranged at the sides of the center thereof, of an elevator permanently located beneath the turret and the path of the guns for independently lowering the guns below the turret and raising them into position for action, said elevator having a cross-head, on which said guns are placed, and a pump for operating said elevator, substantially as described

4. The combination, with a revolvable turret having provisions for a number of guns, of a vertically-moving piston permanently located beneath the path of said guns, trucks mounted on said piston, on which said guns are adapted to be placed, and a pump for operating said piston, substantially as described.

5. The combination, in an armor-turret having pressure-cylinders formed in the bottom thereof, of the pistons working in said cylinders, cross-heads 22, mounted on said pistons, chains secured to said cross-heads and to the gun-carriage, said carriage, and the pulleys located on the supporting-beams and in the bottom of the turret, over which said chains pass, substantially as described.

6. The combination, in an armor-turret, of the vertically-movable pistons having cross-heads thereon, the chains connected with said cross-heads and the gun-carriage, said carriage, pulleys located, respectively, on the gun-supporting beams and at the bottom of the turret, over which said chains pass, and a series of clamps secured to the bottom of the turret beneath said cross-heads for retaining the chains in their adjusted positions, substantially as described.

7. In an armor-turret, the combination, with the vertically-moving pressure-piston and the gun-carriage, of the pulleys mounted on the supporting-beams adjacent to said carriage, pulleys mounted in the bottom of said turret adjacent to said piston, chains connected to the upper end of said piston and to the gun-carriage, and a series of removable supporting-beams upon which the carriage rests when in its elevated position, substantially as described.

8. The combination, with the pressure-piston, the cross-head 23, the clamps 29, carried thereby, the chains 22, secured by said clamps, the pulleys 19 20, situated, respectively, above and below said cross-head, around which said chains pass, the fixed clamps 28, for holding said chains in the desired position, and the base of the gun-carriage to which said chains are attached, substantially as set forth.

9. The combination, with the pressure-piston having a cross-head thereon and the gun-carriage, of the chains interposed between and having connection therewith, the pulleys 20 below said carriage, around which said chains pass, the beams 21, by which said pulleys are held down, the pulleys 19, adjacent to said carriage, around which said chains also pass, the beams 16, by which said pulleys are supported, and the clamps 28, located between the lower pulleys and the upper end of the piston, substantially as set forth.

10. The combination, in an armor-turret, of vertically-moving pistons having trucks secured removably on their upper ends, cylinders formed in the bottom of the turret, in which said pistons work, guns located above the pistons and adapted to be placed on said trucks, and a pump for operating said pistons, substantially as described.

11. The combination, with the gun-carriage, of the removable supports for retaining it in its elevated position, the chains secured to the sides of said carriage, wheeled trucks located beneath the carriage and to which said chains are attached, pulleys located above and below said trucks, over which said chains pass, and pistons engaging said trucks, whereby the same are raised and lowered, substantially as described.

12. The combination, with the gun-carriage having a cylinder thereon and a piston working in said cylinder, of a fluid-pressure cylinder located beneath the carriage, a pipe for conveying fluid under pressure from said pressure-cylinder to the cylinder on the carriage, a stationary core, and a movable core-box interposed between said cylinders for cutting off the pressure as the carriage revolves, substantially as described.

13. The combination, with the gun-carriages having cylinders thereon, pistons working in said cylinders, and a pipe through which fluid under pressure is supplied to said cylinders, of a stationary cylindrical core having ducts formed therein and a movable core-box having openings therein communicating with said ducts in the core, said core and core-box interposed between the cylinders, whereby the pressure is automatically cut off from said carriage-cylinders, substantially as described.

14. The combination, with the carriage-cylinder, pressure-cylinder, and connecting-pipe, of a cylindrical core fixedly secured on said pipe, a movable core-box surrounding said core and having openings registering with ducts formed in the core, and cocks situated between the core and carriage-cylinders for cutting off the supply from the carriage-cylinders when the pipes are to be uncoupled, substantially as described.

15. The combination, with the revolvable turret and the gun mounted therein, of a pressure-cylinder mounted on the carriage of said gun and moving with the same for operating said gun, a fixed fluid-pressure cylinder formed in the bottom of the turret, a weighted piston working therein, pipes leading out from said cylinders, and a universal connection between the pipes which are affixed to the movable and fixed portions of the turret, substantially as described.

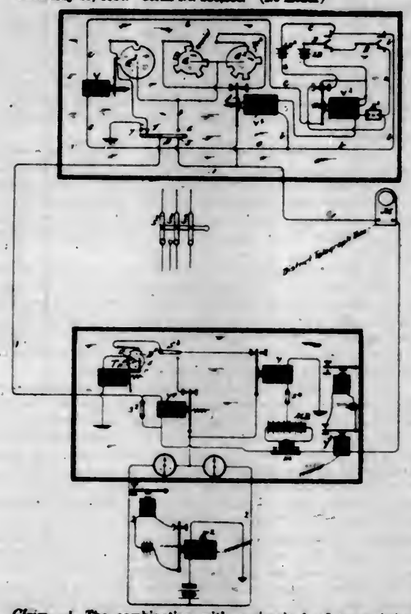
16. The combination, with the revolvable turret, the gun mounted therein, and the movable pressure-cylinder and piston for operating said gun, of the fixed fluid-pressure apparatus, pipes connecting said pressure apparatus with said cylinder, and a universal connection between the portions of the pipes which are affixed, respectively, to the movable and the fixed portions of the turret, substantially as set forth.

17. The combination, with the revolvable turret, the gun mounted therein, and the pressure-cylinder and piston carried thereby for operating the gun, of the stationary fluid-pressure apparatus, pipes connecting said pressure apparatus and cylinder, and a capstan for revolving the turret, the stem of the capstan being made hollow for the passage of the fluid-pressure pipes, substantially as set forth.

18. The combination, with a revolvable turret, the gun mounted therein, and the pressure-cylinder and piston carried thereby for operating the gun, of stationary pressure apparatus and pipe for conveying fluid under pressure from the pressure apparatus to the pressure-cylinder, and a universal connection between the portions of said pipe which are connected, respectively, with the cylinder and the pressure apparatus, substantially as set forth.

19. The combination, with a revolvable turret, the gun mounted therein, and a cylinder and piston carried by said turret for operating the gun, of a stationary pressure apparatus, a pipe for conveying fluid

under pressure from said apparatus to said cylinder, and a universal connection between the portions of said pipe, connected, respectively, with said apparatus and cylinder, said connection being situated concentrically with the center of motion of the turret, substantially as set forth.



20. The combination, with the revolvable turret, the gun mounted therein, and the cylinder and piston carried thereby for operating the gun, of a stationary pressure apparatus, pipes connecting said apparatus and cylinder, a hollow box, and a core fitted therein so as to be capable of relative rotation, having ducts for maintaining constant communication between the pressure apparatus and cylinder, substantially as set forth.

21. The combination, with the revolvable turret carrying the gun, the cylinder and piston for operating said gun, the inlet and outlet pipes 37 39, and the core-box 35, having ducts 36 and 40, with which said pipes respectively communicate, of the core 34, having ducts 33 and 42, communicating, respectively, with the duct 36 and the channel 41, the pipes 32 and 43, communicating with said ducts 33 and 42, and pressure apparatus with which said pipes communicate, substantially as set forth.

22. The combination, with the turret having more than one gun mounted removably therein and a pressure-cylinder and piston for operating each gun, of a stationary pressure apparatus having a single pipe, 32, for conveying therefrom fluid under pressure, having a separate branch communicating with each of said cylinders, each of said branches being formed in sections united by a coupling and provided with a stop-cock for preventing the escape of the pressure-fluid when the sections of the branch pipe are uncoupled, substantially as set forth.

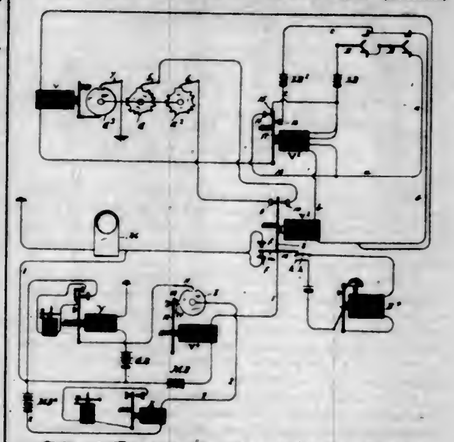
23. The combination, with the gun-support, the cylindrical core having a duct, 33, whose inner end terminates concentrically therewith, and a duct, 42, terminating at the side of said core, of the core-box 35, having a cylindrical cavity in which said core is revolubly fitted, a duct, 36, whose inner extremity opens opposite the inner end of the duct 33, and a duct, 40, whose inner end opens opposite an annular groove, 41, all constructed and arranged to operate substantially as and for the purpose set forth.

388,357. FIRE-TELEGRAPH. John H. Gurr, Brooklyn, N. Y. Filed May 25, 1887. Serial No. 239,262. (No model.)

Claim.—1. The combination, with a circuit, 1, of transmitting and receiving instruments in ground branches or connections from the same and a switch for transferring the transmitting-instrument from a ground wire or connection into the circuit 1, or vice versa, as and for the purpose described.

2. The combination, with a circuit, 1, containing transmitting and receiving apparatus for one class of signals, of ground-connections including transmitters for another class of signals, switches for transferring such grounded instruments to or from the circuit 1, and a switch for breaking the ground-connection containing the receiver.

3. The combination, with the metallic circuit 1, of transmitting-instruments in normally-open ground branches, a switch normally contained in and completing the circuit 1, and a normally-open contact for said switch connected to the said branch at a point between the transmitters and the break in the ground branch, as and for the purpose described.



4. The combination, with a normally-closed circuit, as described, having transmitters and receivers included in each normally-closed circuit, of a ground branch from said circuit normally open, a transmitter in said ground branch at a point between the break in the branch and the line, and a switch connected to line and having a contact-point joined to the ground branch at a point between the transmitter and the break, as and for the purpose described.

5. The combination, with the circuit 1, having grounds over which suitable transmitters operate to send signals to an instrument in the ground-connection on another point on said circuit, of a switch for transferring said transmitter to the circuit 1 and an electro-magnet controlled from a central office for operating said switch, as and for the purpose described.

6. The combination, with the circuit 1 and instruments G G² of any character, having ground-connections from said circuit, of a switch for changing said instruments into the circuit 1, a magnet-controlling said switch responsive to reversals of current on the circuit, and apparatus at the central office for producing such reversals, as and for the purpose described.

7. The combination, with the complete metallic circuit 1, containing instruments M and Y², of a battery, M-B, normally charging said circuit, a pole-changer for reversing said battery on the circuit, an independent set of instruments working over grounds from said circuit, and an electro-magnetically-controlled switch for switching the transmitters working over the grounds into the metallic circuit.

388,358. AUTOMATIC FIRE-TELEGRAPH. John H. Gurr, Brooklyn, N. Y. Filed Oct. 27, 1887. Serial No. 253,505. (No model.)

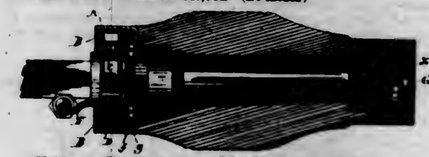
Claim.—1. The combination, with an all-round metallic main-line circuit, of a branch containing a transmitting apparatus, a branch containing a receiver of the signals sent by said transmitting apparatus, a magnet in the main line governing the operative condition of said receiver, and a circuit-controller in said line, whereby the action of the magnet and the condition of the receiver may be governed, as and for the purpose described.

2. The combination, with an all-round metallic circuit, of a branch from the same containing a transmitter, a second branch containing a receiver of the signal sent by said transmitter, a second circuit governed by said receiver, a magnet in the main line governing the continuity of said second circuit, and a circuit-controller, also in said main line, for effecting a momentary change in the condition of the main-line magnet, so as to change the condition of the second circuit, as and for the purpose described.

3. The combination, substantially as described, with an all-round metallic circuit, 1 1, and a circuit, 2, of fire-alarm signal-wheel G, of any suitable character, connected to a branch from circuit 1, a special signal-wheel, G², also connected to a branch of the same, a relay apparatus whose relay-magnet is also in a branch, a controller-magnet for governing the operative condition of the relay apparatus, and a circuit-controlling device connected to circuit 1 for changing the electrical condition of the line, and consequently the condition of said controller-magnet, as and for the purpose described.

4. The combination, with an all-round metallic circuit, 1, having signal-transmitting apparatus in a ground-connection from the same, of a relay apparatus having its magnet also in a ground-connection, a mechanism for governing the operative condition of said relay apparatus, an electro-magnet in the main circuit controlling said mechanism, and a circuit-controller in the main circuit governing the operation of said magnet, as and for the purpose described.

5. The combination, with an all-round metallic circuit, 1, and a circuit, 2, of a relay-magnet in a ground-connection from circuit 1, and having contacts connected with circuit 2, and a magnet, V⁴, in the metallic circuit for governing the operation of the relay devices, as and for the purpose described.



6. The combination, with the all-round metallic circuit 1, of a receiving-instrument, Y, in a branch from the same, a transmitting apparatus in another branch for sending signals of different character or significance, as described, and controlling-magnet V⁴ in the main-line circuit for governing the operative condition of the instrument Y, as and for the purpose described.

7. The combination, with an all-round metallic circuit, 1, having district-telegraph apparatus M connected therewith, of fire or burglar alarm transmitters in branches from said line, a special or derangement signal wheel also connected with the branch, a relay-circuit, 2, a receiving apparatus, Y, for the fire or burglar alarm, and the derangement-signal apparatus, a controller-magnet, V⁴, in the main telegraph-circuit 1, for governing the operative condition of the apparatus Y in relaying signals, and a circuit-controller in the main telegraphic circuit 1, controlling the action of the magnet V⁴.

8. The combination, with an alarm-bell, B⁴, on the outside of an electrically-protected building, of a fire-alarm signal-transmitting wheel having local controlling-circuits, a special or derangement signal-transmitting wheel having local controlling circuits formed in part over the controlling-circuits for the former, and a controlling-magnet for said alarm-bell, connected with a portion of the controlling-circuits for the fire-alarm independent of the controlling-circuits of the special-signal wheel, as and for the purpose described.

9. The combination, substantially as described, of a fire-alarm-signal transmitter, local controlling-circuits therefor, a special or derangement signal transmitter, controlling-circuits for the latter formed, in part, over the controlling-circuits for the former, a circuit-controller at the building to be protected and connected with the line, a local controlling-circuit for the latter controller, a main telegraph-line connecting said transmitting-wheels with a central office, a fire-department circuit, a relay apparatus for relaying the fire-signals from the main circuit to the fire-department circuit, and a controlling-magnet for determining the operative condition of the relay apparatus, said magnet being connected to the main telegraph-line and being governed by the circuit-controller connected with the line at the building to be protected, as and for the purpose described.

388,359. AXLE-LUBRICATOR. James H. Hewet, Viroqua, assignor of one-half to Harlan P. Procter, Vernon County, Wis. Filed Sept. 4, 1887. Serial No. 248,044. (No model.)

Claim.—1. The sections *a* and *b*, with the nozzle and spout, and the cup or conductor forming the self-feeding lubricator-box, for the purpose described.

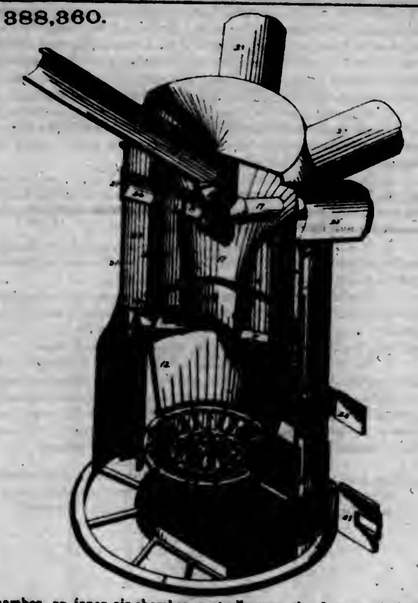
2. The revolving collars A and B and keys *c c*, for interlocking the same, substantially as shown and described.

3. The flanges *f* and *g* on outside of revolving collar A and inside of cap D, which cause the interlocked collars A and B to revolve with the wheel, as hereinbefore set forth.

4. In combination with the point-head, its cover, and the collar G, secured thereto by springs *x* and having two inclines on its face with opening *g'* on each side between them, substantially as and for the purpose set forth.

5. The combination of the self-feeding lubricator-box, the revolving collar A, with serrated flange *f*, also revolving collar B, with keys *c c*, for interlocking the two collars A and B, the wheel-hub and cap with serrated flange *g*, and the rim or collar G, Fig. 5, substantially as set forth.

388,360. FURNACE. Alexander J. Hill, Rockford, Ill. Filed Aug. 22, 1887. Serial No. 247,889. (No model.)



Claim.—1. In a hot-air furnace, the combination of an outer air-chamber, an inner air-chamber centrally over the fire-pot, air-flues connecting the outer and inner chambers, a fire-chamber between the air-chambers, a smoke-flue centrally in the dome, and radial gas-flues connecting the fire-chamber and central smoke-flue, substantially as and for the purpose set forth.

2. In a hot-air furnace, the combination of an outer air-chamber, an inner air-chamber, furnace-chamber between the inner and outer air-chambers, a smoke-flue centrally in the dome, radial smoke-flues connecting the furnace-chamber and central smoke-flue, and radial tubes connecting the jacket and outer wall of the furnace in line with the smoke-flues connecting the furnace-chamber and central smoke-flue, substantially as and for the purpose set forth.

3. In a hot-air furnace, the combination of an outer air-chamber and inner air-chamber centrally over the fire-pot, air-flues connecting the outer and inner chambers, the said connecting-flues extending through the fire-chamber and downwardly along the side of the fire-pot toward the base of the furnace, substantially as set forth.

4. In a hot-air furnace, the combination of an outer air-chamber, an inner air-chamber centrally over the fire-pot, air-flues connecting the outer and inner chambers, said outer and inner chambers meeting in the dome, and a fire-chamber between the said air-chambers, the said fire-chamber being formed by an outer wall-section resting on the top of the fire-pot, an inner wall-section supported centrally over the fire-pot, an upper outer wall-section resting on the top of the first-named outer wall-section, and an inner upper wall-section resting on the top of the said inner wall-section and on the top of the said upper outer wall-section, substantially as set forth.

388,360.

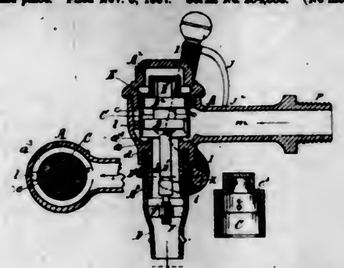
388,361. RELIEF-TYPE PRODUCTION. James W. Hoke, St. Louis, Mo., assignor to the Hoke Engraving Plate Company, of Missouri. Filed Mar. 30, 1888. Serial No. 269,078. (No model.) Patented in England Nov. 26, 1887. No. 16,304.

Claim.—1. As a new article of manufacture, an engraving-plate having a base-plate with a smooth, hard upper surface and a soft, friable coating of minute particles of powdered matter loosely bonded together and having these particles of the coating next the base-plate more strongly bonded to it than the particles above them are bonded either to them or to each other.

2. As a new article of manufacture, an engraving-plate composed

of a base-plate having a smooth, hard upper surface, a soluble mineral bond, and a soft, friable coating of fine earthy particles loosely bonded together and more strongly bonded to the base-plate by said soluble mineral bond, so that the particles of the coating next the base-plate adhere thereto more strongly than the particles above them adhere either to them or to each other, as and for the purposes described.

3. As a new article of manufacture, an engraving-plate having a soft, friable coating composed of minute earthy particles bonded together and to a base-plate having a smooth, hard upper surface by soluble glass, for the purposes set forth.



4. In combination with a base-plate having a smooth, hard upper surface, a coating composed of soluble glass, silicate of magnesia, and sulphate of barium, in substantially the proportions herein recommended, as and for the purposes described.

5. In combination with a base-plate having a smooth, hard upper surface of soluble glass and a mixture of pulverized earths of different specific gravities, as and for the purposes described.

6. The herein-described process of making an engraving-plate having a coating bonded by a soluble glass, consisting in introducing the bond in solution into contact with all the particles of the coating and then drying the coating by heat, substantially as directed.

7. The herein-described process of making and finishing an engraving-plate having its coating bonded by a soluble glass, consisting in reducing the earthy matter used to a fine powder, and subsequently introducing the bond in solution into contact with all the earthy particles of the coating, drying the coating on a base-plate by heat, and finally removing the crust, all substantially as herein directed.

388,362. FAUCET. Albert P. Howes, Worcester, Mass., assignor of two-thirds to Edmund Converse and Ambrose T. Matthews, both of same place. Filed Nov. 5, 1887. Serial No. 254,353. (No model.)

Claim.—1. A faucet having a primary valve that closes in the direction of the flow, an auxiliary valve or cup provided with small orifices in its side, arranged over said valve and fitting an annular seat around the primary valve-seat, and having a chamber above the valve from which the liquid is forced by the action of opening the valve, and into which the liquid must return through limited space as the valve closes, for the purpose set forth.

2. The combination, substantially as described, with the faucet body or shell A, having the valve-seat *a*, inlet-passage *m*, and discharge-passage *a'*, of the valve-puppet B, the cup C, arranged over said valve with its flange extending downward and surrounding said valve-puppet, and having the chamber E between said cup and valve, substantially as and for the purpose set forth.

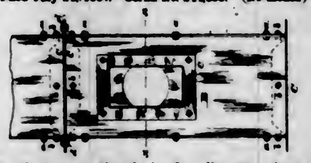
3. The combination, substantially as described, of the faucet-body A, having the valve-seats a a^2, the valve-puppet B, having the depending spindle B' and auxiliary disk B^2, the cup C, having orifices *c* in its side, arranged over said valve and closing upon the seat a^2 around said valve, and a movable discharge-nozzle having a step that engages the valve-spindle, for the purposes set forth.

4. The combination, substantially as described, of the shell A, valve-puppet B, cup C, inverted over and surrounding said valve-puppet, movable nozzle D, sliding upon the body-extension A', having the engaging step F, arranged across the interior of said nozzle below said extension, the lever I, fulcrumed on a projection of the body at K with its ends engaging a projection upon the exterior of said nozzle, for the purpose set forth.

5. In a faucet, the cup C, provided with a shoulder or lug, C', disposed for engaging with the valve-puppet at an intermediate point in its movement to lift the flange of the cup from its seat a^2, as described, in combination with the valve-puppet, puppet-lifter, discharge-nozzle, and faucet-body, whereby the faucet is adapted for delivering the liquid in greater or less force and volume, substantially as set forth.

6. The combination, with the valve B and valve-operating nozzle D, of the bearing-step provided with an adjusting screw-stud, F, for the purpose set forth.

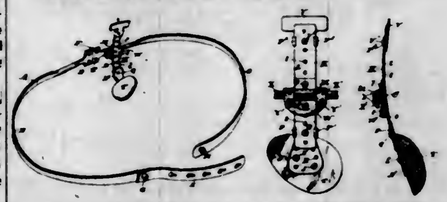
7. The bridge or bearing-step F', separately constructed with the ends of its arms slightly inclined, in combination with the faucet-body A, valve B, and valve-operating nozzle D, internally bored with an intermediate beveled surface to match the end of said arm, and against which said arms are wedged for retaining the step in position, as set forth.



8. In a faucet wherein the valve is lifted by a step in connection with the discharge-nozzle, the valve-stem having a cavity, *f*, in combination with the valve-operating step and discharge-nozzle in its lower end, and the adjustable supporting-stud F, having its point *f'* of less diameter than said cavity, substantially as described, and for the purpose set forth.

388,363. REACH-BAR FOR VEHICLES. Henry M. Hosmer, Eldon, Iowa. Filed May 3, 1888. Serial No. 272,619. (No model.)

Claim.—The combination, in a reach-bar for vehicles, of a bar, B, provided with a longitudinal series of perforations, and at its front end with a transverse strap rigidly secured thereto, the ends thereof projecting beyond the vertical edges and bent upwardly and turned inward, as shown, the adjustable portion D having side pieces which embrace the vertical edges of the bar B, straps H, formed on or secured to the outer edges thereof to engage with the upwardly and inwardly turned ends of the strap C, the rear ends of the side pieces being connected to each other, said connecting portion being provided with a central perforation, and a bolt for connecting the parts adjustably to each other, substantially as shown, and for the purpose set forth.

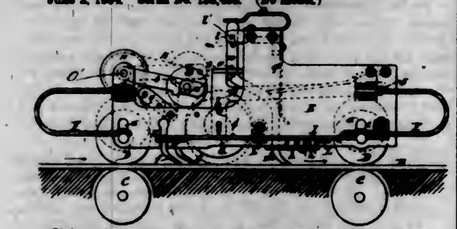


388,364. HOT-AIR FLUE. Samuel B. Judkeufts, Philadelphia, Pa. Filed July 21, 1887. Serial No. 244,855. (No model.)

Claim.—1. A connecting device for adjacent sections of a hot-air flue, consisting of two plates each having an opening in its center, the walls whereof are turned up and adapted to enter the end of one of the sections and secured thereto by bolts or rivets, the flange or rim of the plate being substantially flat throughout its length and projecting beyond the diameter of the section, as stated.

2. A device of the character named consisting of a plate with turned-up inner portions adapted to be secured to one of the sections of a flue, and having a flange or rim substantially flat throughout its length, with openings, whereby it is adapted to be secured to an attachment of said flue, as stated.

388,365. TRUSS. Henry W. Kreiss, Summerville, S. C. Filed Mar. 2, 1888. Serial No. 265,973. (No model.)



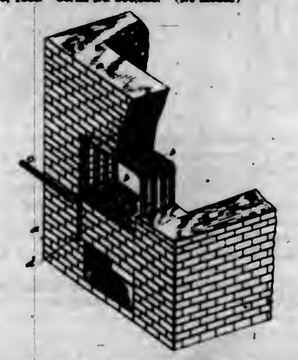
Claim.—1. The combination, with the body of an abdominal truss, of the sectional pad-holder, the intermediate section hinged to the body of the truss, and the end sections of said pad-holder secured adjustably to said intermediate section, substantially as specified.

2. The combination, with the body portion of a truss, of the hinged sectional pad-holder, the securing-hinge connecting the middle portion of the pad-holder to the body portion, and the adjustable U-shaped clamp secured to the body portion on opposite sides of the hinged pad-holder, substantially as specified.

3. In an abdominal truss, the combination, with the body portion, of the pad-holder comprising the hinged middle or intermediate portion and the adjustable end portions secured thereto by rivets and provided with guides for limiting the lateral movements of the end portions, substantially as specified.

388,366. MAIL-STAMPING APPARATUS. Emil Laase and Gustave W. Hey, Syracuse, assignors, by direct and mesne assignments, to the International Postal Supply Company, New York, N. Y. Filed June 2, 1884. Serial No. 133,695. (No model.)

Claim.—1. In a machine for stamping or marking mail-matter, the combination, with the supporting-feed bed, of a stamp normally out of the path of movement of the mail-matter, and a stamp tripper or releaser normally in said path.



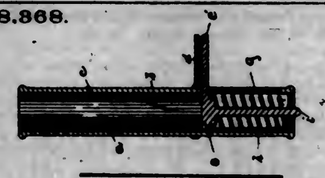
2. In a machine for marking mail-matter, the combination of an oscillating frame carrying a marking-roller, and a lever provided with a catch for engaging the oscillating frame and extending into the path of the moving mail-matter.

3. In a machine for marking or stamping mail-matter, the combination, with a supporting-feed bed, of a stamp normally out of the path of the movement of the mail-matter, and a stamp tripper or releaser normally in said path and opposite the letter-bed, substantially as specified.

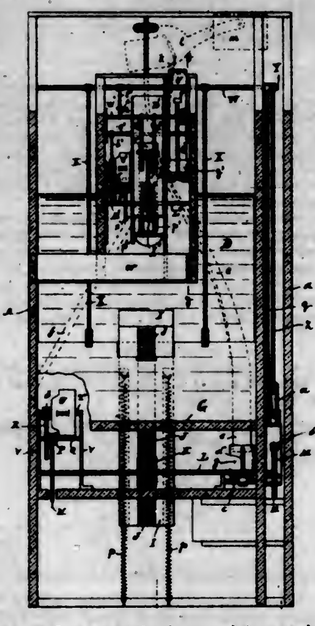
4. The frame H, having cap *o* and pin *b*, the catch-lever *m*, having catch *p* and pin *o'*, the trigger A, having the shoulder *k*, the roller G, and spring G', combined with the means *f*, and connections, substantially as described, for tripping the trigger, and with the cam *d*, for returning the frame H to the control of the trigger, as set forth.

5. The combination, with the marking-roller and a movable frame supporting said roller, of cams and stud-pins connected, respectively, to said parts and in contact with each other to raise the frame automatically with the rotation of the roller, and springs bearing on the roller-journal to force the roller off from the letter-bed when the frame is raised as aforesaid, substantially as specified.

388,367. FEED-WATER HEATER AND LINING FOR FURNACE-MOUTHS. Ira B. Lamprey and Alden C. Bowers, Lake Village, N. H., assignors to the Lamprey Manufacturing Company, same place. Filed Mar. 5, 1888. Serial No. 266,226. (No model.)



Claim.—The combination, with a furnace and its mouth, of the series of pipes extending along the opposite sides and top of said mouth, and the inlet and outlet pipes connected to the respective ends of said series of pipes, substantially as shown and described, whereby water in said pipes is heated and the said mouth is braced or supported, as set forth.



388,368. WHIP-SOCKET. James Lathrop, Berwick, Conn., assignor of one-half to William L. Beach, same place. Filed Apr. 2, 1888. Serial No. 269,312. (No model.)

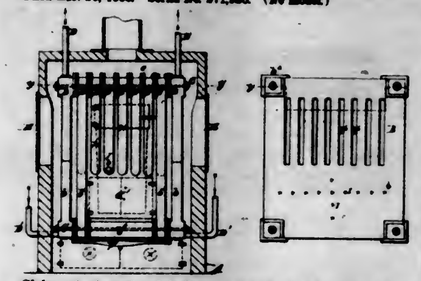
Claim.—A whip-socket with a laterally-projecting fixed jaw, having in combination therewith a movable jaw actuated by a spring within the barrel of the socket, substantially as set forth.

388,368.

388,369. AUTOMATIC SALESMAN AND CHANGE-MAKER. George D. Moses, Milton Chase, and De Forest W. Chase, Haverhill, Mass. Filed Mar. 5, 1888. Serial No. 266,362. (No model.)

Claim.—1. In an automatic salesman and change-maker, the combination of the following elements: a box or case, A, provided with a shelf or support, D, set on an angle, a bar, I, chute *e*, shafts W Y, rods X, levers Z *q*, pawl *b*, shaft *c*, rod *d*, pan *g*, ratchet-wheel M, shaft L, and clock-work mechanism, substantially as and for the purposes set forth.

2. A case or box, A, provided with an adjustable shelf or support, D, partition G, and chute *e*, in combination with bar I, rack J, springs *p p*, pinion K, shaft L, provided at one end with clock-work mechanism and at the other end with a pawl-wheel, M, pawl *b*, shaft *c*, rod *d*, and pan *g*, substantially as and for the purposes set forth.

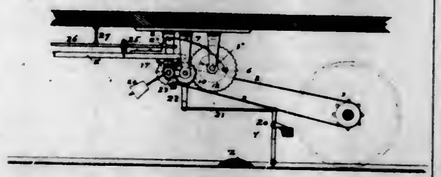


3. The shaft W and rods X X and *q*, in combination with the pawl *b*, ratchet-wheel M, shaft L, pinion K, rack J, bar I, and clock-work mechanism, substantially as and for the purposes set forth.

4. The combination of a case or box, A, having a shelf or support, D, set on an angle for supporting the goods or packages, and a bar, I, for retaining them in place, with change-compartments consisting of a shelf or support set on an angle, bars or rods I', for retaining the change in place, a chute and pan, said pan being arranged below the chute, the rods X', shaft W', arm *r*, bar *s*, arm *t'*, shaft Y, rod A, pawl *b*, ratchet-wheel M, shaft L, and clock-work mechanism, whereby one package in passing out of the box stops the mechanism, substantially as shown and described.

5. In an automatic salesman, a chute provided with an opening to receive coins of all sizes and formed with ledges of shelves on each side, forming channels of various widths, the widest being at the upper side and the narrowest at the under side, said channels being of different lengths and each provided at its lower end with an opening, substantially as and for the purposes set forth.

6. In an automatic salesman, the chute *e*, in combination with the lever *j*, shaft *i*, rod or bar *k*, slotted lever *l*, and sign-board *m*, substantially as and for the purposes set forth.



388,370. SECTIONAL BOILER. John D. Moray, Detroit, Mich. Filed Apr. 26, 1888. Serial No. 271,980. (No model.)

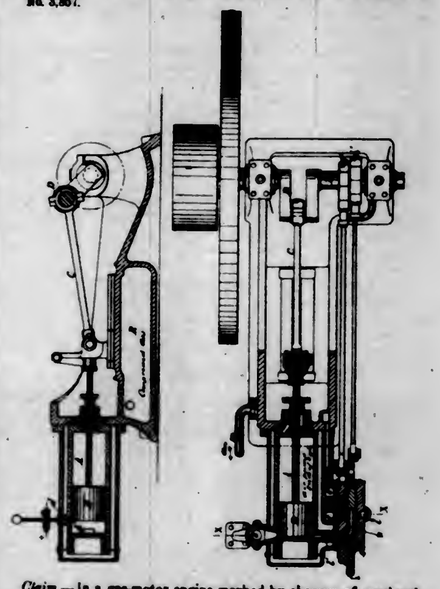
Claim.—1. A sectional boiler composed of end sections, B, extending from top to base, adjacent sections B', extending from top to base at their forward and rear ends, but bridging the fire-chamber between the ends, and sections B^2, bridging the fire-chamber and extending from top to base at their rear ends, said sections united at their upper and lower ends by communicating hubs, and each of said sections provided with tubes b^4 and flue-spaces b^5, substantially as shown and described.

2. A sectional boiler composed of end sections, B, extending from top to base, adjacent sections B', provided with water-legs that depend from said sections at front and rear, and the sections B^2, provided with water-legs depending from the rear of said sections, the tops of the sections and the bottoms of the sections B and the water-legs of sections B' and B^2 being united by communicating hubs, and each of said sections provided with flues b^3 and tubes b^4, substantially as shown and described.

388,371. AUTOMATIC STATION-INDICATOR FOR RAILWAY-CARS. Thomas W. Mumnos, San Francisco, Cal. Filed Apr. 18, 1888. Serial No. 271,062. (No model.)

Claim.—1. In a station-indicator for railway-cars, the combination of a suitable case, the card-rest H, located in the front part of said case, card-elevator consisting of rod G, arms G', inwardly-bent ends G^2, and fingers G^3 on said ends for taking hold of the card, a sliding rod, C, to which the card-elevator is attached, springs K K, located in front and above the card-rest, movable back rod I, between which back rod and springs the card rests while being exhibited, and means for elevating the rod to release the card, substantially as set forth.

2. In a station-indicator for railway-cars, separate name-bearing cards or plates, and a card-elevating device consisting of a vertically-sliding frame having fingers to engage slots in the cards, in combination with a card-rest, H, springs K K, and a back rod or support, I, between which and springs K a card is held while being exhibited, said rod or support being elevated by the movement of the card-elevating device, whereby the card is released and caused to fall back, as described.



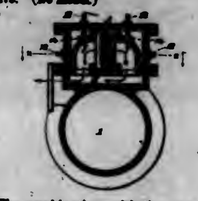
3. In a station-indicator, a case having sight-openings B^2 B^3, a stack of name-bearing cards or plates, the rest H, a card-elevating device adapted to engage the foremost card and set it on the rest, and the springs K K and movable back support, I, the card standing between springs K and support I while being exhibited, the support I being elevated by the movement of the card-elevating devices to release the card, in combination and for operation as hereinbefore set forth.

4. In combination with an indicator, the indicator-operating rod C, the push-bar E, continuously-running shaft $1^\times$, crank, and pitman-bar 7, driven from the car-axle, and mechanism adapted to set or bring the push-bar and pitman-bar into engagement, as described, which is actuated or set in motion by steps on the surface of the roadway, whereby the said pitman-bar is caused to operate the rod C, as hereinbefore described.

5. In combination with the push-bar E for operating an indicator in a railway-car, the shaft $1^\times$, driven continuously from the car-axle, the pitman-bar 7, operated from shaft $1^\times$, rock-shaft 14, geared to shaft $1^\times$, carrying tappets 16, and clutches 18 19, one of which is geared into the continuously-driven shaft, and mechanism, substantially as described, for throwing the sliding part of said clutch into and out of action with its continuously-running fellow at intervals of time, whereby the said pitman-bar is made to engage and move the push-bar a given distance, as hereinbefore set forth.

6. The combination of the continuously-driven shaft $1^\times$, crank and pitman-bar receiving motion therefrom, rock-shaft 14, tappets 16, clutches 18 19, the former being loose and also geared into the crank-shaft, and the latter being fast but free to slide on the rock-shaft, the segment 23, fixed incline 28, and stud 29 on the clutch as means for throwing the same alternately into and out of action, and the setting-lever Y, adapted to be acted on by fixed stops on the roadway and to throw the said segment Y into operation, substantially as set forth.

388,372. GAS-MOTOR ENGINE. Nikolaus A. Otto, Cologne, Prussia, assignor to the Gas Motoren Fabrik Deutz, Deutz-on-the-Rhine, Germany. Filed Oct. 10, 1887. Serial No. 251,945. (No model.) Patented in Germany Aug. 27, 1887, No. 43,185; in England Sept. 5, 1887, No. 12,187; in Belgium Sept. 21, 1887, No. 78,948; in Italy Nov. 12, 1887, XLIV, 190, and in Austria-Hungary Mar. 3, 1888, No. 37,627 and No. 3,857.

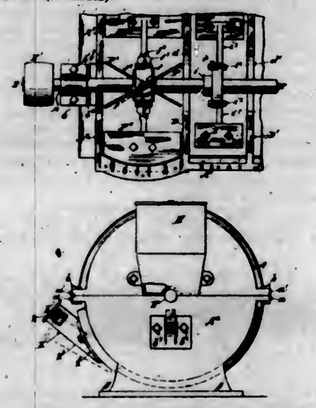


Claim.—In a gas-motor engine worked by charges of combustible gas and air under pressure, the method of forcing into a reservoir containing air under pressure a quantity of combustible gas sufficient for one cylinder-charge, such quantity being situated next the inlet-port of the engine in a part of the reservoir of restricted area, so that it will practically not mix with the air in the reservoir and will be entirely introduced into the cylinder by the pressure of the air on the opening of the inlet valve or slide, substantially as herein described.

388,373. CHURN. Robert C. Rasmuss, McLeansborough, Ill. Filed Apr. 16, 1888. Serial No. 270,827. (No model.)

Claim.—The combination of the standard A, provided with notches F, rockers B, standards C, braces D, and handle E, with the body H, the suspending-straps I, and the cross-rod G, substantially as described.

388,374. SLIDE-VALVE. William A. Rasmuss, Memphis, Tenn., assignor of one-half to John R. Rundle, same place. Filed Feb. 13, 1888. Serial No. 264,479. (No model.)



Claim.—1. The combination, with the steam-chest having the ingress and exhaust ports, of the two steam-chambers located within said chest and at both ends and having vertical faces 3, elongated toward each other and arranged parallel with two ports therein communicating with the ports in the chest, respectively, and valves fitted between said elongated faces 3, connected together and having cavities 11 on both sides adapted to cover both ports in each face.

2. The combination, with the steam-chest having ports 8 9 and the valve, of the steam-chambers in said chest having ports 6 7, communicating with ports 9 8, respectively, and set-screws bearing upon the tops and sides of said steam-chambers, substantially as set forth.

3. The combination, with the steam-chest having ports 8 9 and the slide-valve, of the steam-chambers in said chest, having ports 6 7, communicating with ports 9 8, respectively, and set-screws bearing upon the tops and sides of said chambers and projecting through the plates of the chest, substantially as set forth.

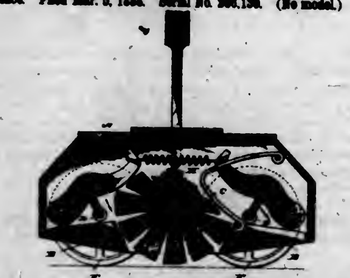
4. The combination, with the steam-chest having ports 8 9 and the slide-valve, of the steam-chambers in said chest, having ports 6 7, communicating with ports 9 8, respectively, elongated bearings upon the tops of said chambers, and set-screws bearing upon said elongated bearings and upon the sides of said chambers and projecting through the plates of the chest, substantially as set forth.

388,375. APPARATUS FOR REDUCING AND PULVERIZING FUEL. Hamilton Rudgen, Brooklyn, N. Y., assignor to the Pulverized Coal and Furnace Company, of New York. Filed Nov. 6, 1885. Serial No. 181,966. (No model.)

Claim.—1. In a machine for pulverizing fuels, &c., the combination, substantially as hereinbefore set forth, with the pulverizing-chamber, of a blowing-compartment having spherical side walls, and a rotating shaft carrying one or more rotary fans having laterally-adjustable blades which are curved on their peripheries to correspond to the walls of the blowing-compartment.

2. In a machine for pulverizing fuel, &c., the combination, substantially as hereinbefore set forth, with the cylindrical pulverizing-chamber, the shaft, and rotary beaters, of a blowing-compartment having spherical side walls placed at one end of said chamber and connected therewith, and a rotary blowing-fan rotating upon the same shaft as the rotary beaters, and having laterally-adjustable blades the peripheries of which are curved to correspond to the walls of the blowing-compartment.

3. In a machine for pulverizing fuels, &c., the combination, substantially as hereinbefore set forth, with the pulverizing-chamber, of a blowing-compartment having spherical side walls, and a rotary blowing-fan in its interior, the blades of which are laterally adjustable and curved on their peripheries to correspond to the walls of the compartment.

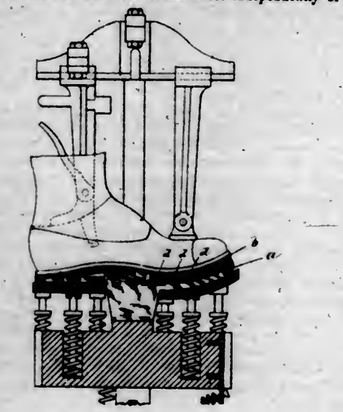


4. In a machine for pulverizing fuels, &c., the combination, substantially as hereinbefore set forth, with the blowing-compartment, of a sliding tangential discharge-pipe, whereby the angle of discharge of the pulverized material may be varied at pleasure.

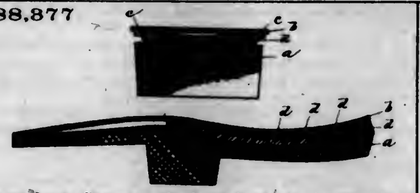
5. In a machine for pulverizing fuels, &c., the combination, with the pulverizing-chamber, of a blowing-compartment connected therewith, and rotary blower-fan, the blades of which are adjustable at any angle to the axis of rotation.

6. In a machine for pulverizing fuels, &c., the combination, substantially as hereinbefore set forth, with the blowing-compartment, of an adjustable tangential discharge-spout, whereby the angle of discharge may be varied at pleasure, provided with a curved flange fitting over the periphery of said compartment, said flange being formed with slots in its side, and bolts in the side walls of the compartment passing through the said slots, whereby the said discharge-spout may be caused to slide upward or downward at pleasure.

7. In a machine for pulverizing fuels, &c., the combination, substantially as hereinbefore set forth, with the exterior shell of the machine, composed of removable sections, of a removable sectional lining fitting into and corresponding with the sections of the shell, and having the longitudinal edges countersunk to receive bolt-heads, and a series of angle-irons bolted into recesses in said cylinder-sections to which the longitudinal edges of said lining are bolted.



388,376. CARPET-SWEEPER. Hiram W. Ex Tus, Goshen, Ind., assignor of two-thirds to Henry A. Gore and Edward W. Walker, same place. Filed Mar. 5, 1888. Serial No. 266,139. (No model.)

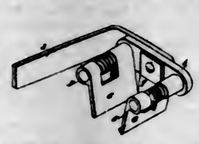


Claim.—The combination, with the case having journal-apertures, as described, of the levers G, pivoted at their lower ends to the side walls of the case, the U-shape journals E, having their outer ends secured to the drive-wheels and their inner ends secured to the levers E, about midway of the length of the latter, and the spiral spring H, connecting the upper ends of the said pivoted levers and the rotative brush, substantially as specified.

388,377. PAD FOR SOLE-LAYING MACHINES. Aaron F. Smith, Lynn, Mass., assignor to the Boot and Shoe Sole Laying Company, Portland, Me. Filed Dec. 24, 1887. Serial No. 258,900. (No model.)

Claim.—1. In a sole-laying machine, a flexible sheet, as *b*, formed to constitute a sole-pressing surface, and provided with a series of transverse metal ribs attached to the sheet independently of each

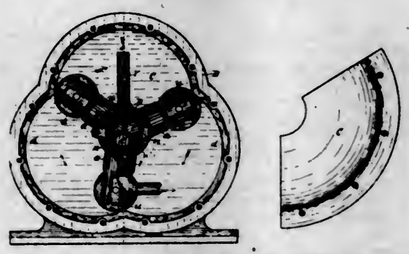
388,877



other and extending across the sheet, whereby the sheet is stiffened crosswise, but left free to bend lengthwise, as set forth.

2. In a sole-laying machine, the combination, with the yielding sole-pressing pad *c*, of the flexible sheet *b*, having the transverse independently-attached metal ribs extending across it, as set forth.

3. The flexible sheet *b*, provided with the independently-attached metal ribs *d*, having concave inner surfaces, as set forth.

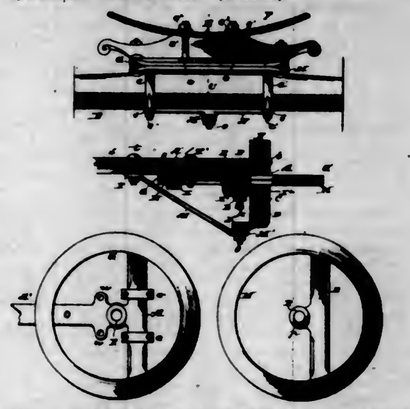


388,878. VEHICLE-WHEEL SCRAPER. Joseph Sparrow, Atchison County, Kans. Filed Apr. 30, 1888. Serial No. 272,264. (No model.)

Claim.—1. The combination, as hereinbefore set forth, to form a scraper for wheels as they rotate, of an arm, 3, secured to the vehicle, a cross-piece, 4, secured to said arm, and spring-actuated plates 6 6, carried by said cross-piece and bearing against the side of the fellies.

2. The combination, as hereinbefore set forth, to form a scraper for wheels as they rotate, of an arm, 3, a cross-piece, 4, secured to said arm and having lugs projecting therefrom, spring-actuated plates 6 6, supported by said lugs, and the plate 7.

388,879. ROTARY ENGINE. Lachelle J. Strait, Kalamazoo, Mich. Filed Feb. 10, 1888. Serial No. 263,602. (No model.)



Claim.—1. In a rotary engine, the combination of a power-shaft having an internal chamber, independent hollow cylinders communicating with one end of said chamber and radiating from the shaft, induction and eduction ports leading into the other end of said chamber, an individual wheeled piston in each cylinder, extending into said chamber, which is common to them all, and inclines for the wheels to traverse, substantially as set forth.

2. In a rotary engine, a power-shaft having the internally-cored chamber and the ports leading into it, independent cylinders radiating from said chamber, an individual piston in each cylinder, the contiguous ends of said pistons being in said chamber and V-shaped and having a wheel at the outer end of each, and suitable inclines for the wheels to traverse, substantially as set forth.

3. The combination of a power-shaft having the internal steam-chamber, a series of cylinders radiating therefrom and communicating therewith, and being equidistant from each other, a wheeled piston in each cylinder, and inclines representing portions of like circles arranged in relation to the cylinders and pistons, as stated, whereby said pistons all operate in unison, substantially as set forth.

4. The combination of the power-shaft having the internal steam-chamber and the ports leading into it, the bearing portion of the shaft where the ports are being tapered, the fixed collar, and the internally-flared adjustable box, whereby the wear can be taken up to prevent steam leaking from the ports through the bearings, substantially as set forth.

388,880. VEHICLE-GEAR. Henry C. Swan, Oshkosh, Wis. Filed Apr. 11, 1888. Serial No. 270,269. (No model.)

Claim.—1. In vehicle-gears, the combination, with an elongated reach-plate having a transverse plate and a top circle-plate at its front end, the said reach-plate having a perforation therein, of the lower circle-plate having a centrally-located integral pin, and a bracket-plate secured to the reach and provided with lips which overlap the under surface of the lower circle-plate, substantially as set forth.

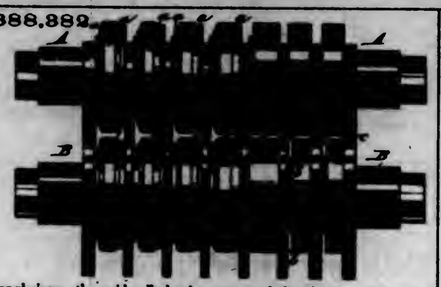
2. In vehicle-gears, the combination, with a top circle-plate having an integral reach-plate projecting from it, and a lower circle-plate provided with a pin having swivel engagement with a perforation made in the integral reach-plate near the radial center of the top circle-plate, of a bracket-plate secured to the reach-plate by suitable means, and adapted to retain the lower and upper circle-plates in place and take up wear, substantially as set forth.

3. In vehicle-gears, the combination, with a spring, a head-block, a reach, a top circle-plate, and a reach-plate integral with this top circle-plate, of a lower circle-plate, a bracket-plate, a set-bolt secured in this bracket-plate, an axle, a wooden axle-stock, clamping-plate bolts to hold the axle-stock, axle, and clamping-plate together, a depending pin formed on the clamping-plate, and a diagonal brace that engages this pin and is attached to the reach-plate and reach, substantially as set forth.

4. In vehicle-gears, the combination, with the reach-plate perforated to receive a cylindrical pin, and a lower circle-plate with its transverse axle-plate that is provided with a cylindrical pin, of a bracket-plate secured to the lower side of the reach-plate and having a lug which is adapted to loosely secure the lower circle-plate in position, substantially as set forth.

388,881. CASTER-SOCKET. William P. Tracy, Grand Rapids, Mich. Filed Feb. 25, 1888. Serial No. 265,269. (No model.)

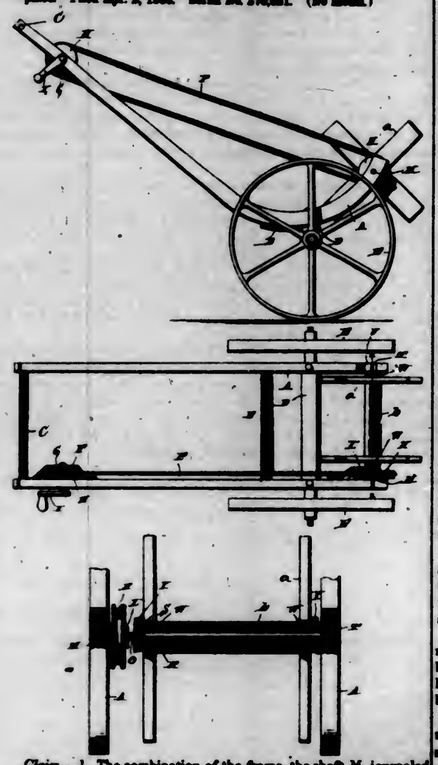
Claim.—1. A caster-socket made in two parts combined with a retainer for the caster-spindle, consisting of a metal shell provided with parallel slots therein, with the intermediate part bent in to form a spring, the socket having a contracted lower opening for preventing displacement of the retainer, substantially as described.



2. A caster-socket made in two parts, having projections or ribs on the outer periphery of each, combined with a ring for holding the parts together and notched to fit the ribs, substantially as described.

388,882. ROLLS FOR CONVERTING OLD RAILS INTO ANGLE IRON. Abraham Vaughan, Terre Haute, Ind., assignor to Firman Hippart, same place. Filed June 14, 1888. Serial No. 277,087. (No model.)

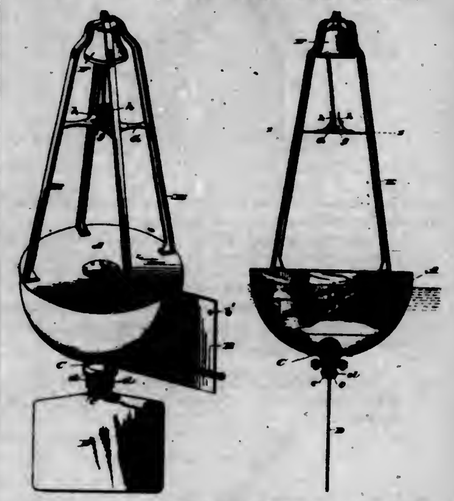
Claim.—A pair of rolls for reworking old rails and stub ends into



388,882.

angle-iron, the said rolls having passes of the shapes designated at 1, 2, 3, 4, 5, 6, and 7, substantially as shown and described.

388,883. WIRE-REEL. William L. Wilson and Edward Walton, Charlton, Iowa, assignors of one-third to William D. Wilson, same place. Filed Apr. 3, 1888. Serial No. 270,021. (No model.)



Claim.—1. The combination of the frame, the shaft M, journaled in one side thereof, the shaft R, journaled in line with shaft M and having one end detachably connected thereto, said shaft R being adapted for the attachment of a reel or spool, and means, substantially as described, to rotate the shaft M, substantially as set forth.

2. The combination of the frame, the shafts G M, journaled therein, the wheels or pulleys and chains or belts connecting said shafts, said shaft G having crank I, the shaft R, having one end journaled in the frame and having its opposite end detachably secured to shaft M, the spool *a* on shaft R, and the collars secured to said shaft and engaging the spool, substantially as described.

3. The combination of the frame, the shafts G M, journaled therein, the sprocket or other wheels and chain, rope, or belt connecting the said shafts, the shaft R, having one end journaled in the frame and having its opposite end detachably secured to the shaft M, and the spool *a*, secured to the said shaft R, substantially as described.

4. In a wire-reel, the side bars, A, having the upward-curved ends, the axle D, secured to the under side of the said bars in advance of the curved ends thereof, the reel-shaft and reel mounted in the curved ends of the side bars above and in rear of the axle, and the wheels mounted on the axle, substantially as described.

388,884. SOUNDING ALARM-BUOY. Albert L. Woodworth, Norfolk, Va. Filed Apr. 26, 1888. Serial No. 271,896. (No model.)

Claim.—1. The combination, in a bell-buoy, of a float having a mooring-fin and a fin at an angle therewith, for the purpose set forth.

2. The combination, in a bell-buoy, of a float and superstructure mounted thereon, from which a bell is rigidly suspended, and a clapper for said bell pivoted beneath the same, said clapper being operated solely by the movement of the buoy, substantially as shown, and for the purpose set forth.

3. The combination, in a bell-buoy, of a float provided with a mooring-fin which extends from the top to the base thereof, and a depending fin secured to the base of the buoy at an angle with the mooring-fin, substantially as shown.

4. The combination, in a buoy, of a hemispherical float having a fin rigidly secured thereto, said fin being provided with means for attaching a mooring-cable thereto, a depending fin, D, secured to the base of the buoy, so as to be adjustable thereon, and a superstructure carrying a bell and clapper, said clapper being pivoted below the bell, substantially as shown, and for the purpose set forth.

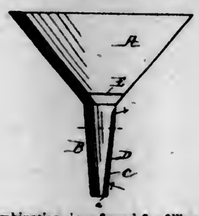
5. The combination, in a bell-buoy constructed substantially as shown, of a casting, C, serving as a weight for the buoy, and means for attaching thereto a depending fin, means for mooring the buoy to maintain said fin normally at an angle with the current, and a superstructure carrying a bell and pivoted clapper, substantially as set forth.

6. The combination, in a buoy, of a superstructure having a bell rigidly secured to the upper portion thereof, a platform beneath said bell having bearings to which a clapper is pivoted, and springs for holding the clapper out of contact with the bell after the blow has been struck, substantially as shown, and for the purpose set forth.

7. In combination with a buoy, a superstructure having a bell rigidly secured thereto and a clapper pivotally attached to bearings mounted on the platform beneath the bell, so that the clapper will oscillate when the center of gravity of the buoy is changed, substantially as described, and for the purpose set forth.

388,885. BIRD AND PACKING BOX. Charles I. Wooster, Berlin, N. J. Filed Mar. 29, 1888. Serial No. 268,856. (No model.)

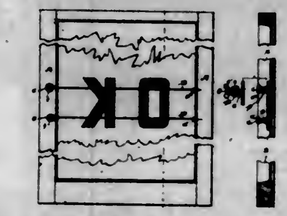
388,385.



Claim.—1. A convertible packing and bird box having in its end concentric kerfs, whereby bird-nest doors or openings of different sizes may be readily made, substantially as described.

2. A convertible packing and bird box having kerfs in its ends and having a covering for said kerfs, the said covering having thereon lines or marks corresponding to said kerfs, substantially as described.

3. A convertible packing and bird box consisting of a body having a hinged lid, kerfs in its ends, and a covering for said kerfs, the said covering having thereon lines or marks corresponding in number and location with said kerfs, substantially as and for the purpose set forth.



388,386. BOTTLE-FUNNEL. CHRISTIAN XANDER and WILLIAM THOMAS, Washington, D. C. Filed June 14, 1888. Serial No. 277,120. (No model.)

Claim.—The combination, in a funnel for filling vessels, provided at its shank with a vent-tube formed by indenting the shank longitudinally and covering said indentation with a piece of metal provided with air-induction apertures, the top of the tube forming the exit for the air, substantially as set forth.

REISSUES.

10,952. WINDOW-SIGN. GEORGE H. RANDOM, Cleveland, Ohio. Filed May 16, 1888. Serial No. 274,092. Original No. 362,360, dated May 3, 1887.

Claim.—1. In window-signs, the combination, with wires stretched across the window, of letters or characters forming the sign, the same being mounted on the wires, such letters and characters being detachably secured to the wires and made adjustable toward or from the window, substantially as set forth.

2. In window-signs, the combination, with wires stretched across the window and having removable letters or characters adjustably secured to such wires, of suitable devices for tightening the wires from one end of the same, said wires being detachably secured to the window at its other end, substantially as and for the purposes shown and described.

3. In window-signs, the combination, with wires stretched across the window, and letters or characters forming the sign mounted on the said wires, substantially as indicated, of a spindle mounted in the window sash or frame and a ratchet and pawl for tightening the wires, the parts being arranged substantially as described.

4. In window-signs, the combination, with wires stretched across the window and letters or characters forming the sign, the same being mounted on the said wires, of screw-threaded studs attached to the respective letters, said studs being provided with jam-nuts for embracing the wires, substantially as set forth.

5. In window-signs, the combination, with wires stretched across the window, letters or characters forming the sign mounted on such wires, and suitable devices for tightening the wires, of a screw-eye for holding the one end of the wire, said screw-eye having an elongated eye or slot, and a cross-bar attached to the wire, said cross-bar being adapted to span the slot and to pass through the slot when turned lengthwise of the same, substantially as set forth.

PHOTO LITH. NORRIS PETERS WASHINGTON D.C.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

WRIGHT *v.* DAGGETT.

Decided August 9, 1888.

1. EXAMINATION OF WITNESSES—ADMISSIBILITY OF EVIDENCE.

It is well settled that when a party has had an opportunity to cross-examine a witness and has neglected to do so the case is the same in effect as if he had cross-examined, otherwise the admissibility of the evidence would be made to depend upon his pleasure whether he would cross-examine or not, which would be a most uncertain and unjust rule.

2. SUPPRESSING DEPOSITIONS.

The manner of taking depositions and the whole conduct of such proceedings rest with the Federal courts, and parties taking testimony should apply to the district judge for an order to compel the attendance of witnesses. Before a deposition should be suppressed when a witness fails to present himself for cross-examination the court will look into the character of the deposition, and from that determine whether the aggrieved party ought not to have applied to the district court for an order compelling attendance, instead of resorting to a motion to suppress, which motion, while noticed at the time the deposition was taken, was not urged until the hearing of the case upon the question of priority before the Patent Office.

APPEAL from Examiners-in-Chief.

BOOK-STAPLING MACHINE.

Application of Christopher Wright filed August 5, 1884, No. 139,705. Application of John F. Daggett filed April 19, 1884, No. 128,494.

Mr. H. Harrison and *Messrs. Foster & Freeman* for Wright.

Mr. John G. Elliott for Daggett.

HALL, *Commissioner:*

Priority of invention was awarded by the Examiner of Interferences to Wright, and upon appeal to the Examiners-in-Chief this decision was reversed, and priority was awarded to Daggett, from which award Wright now appeals to the Commissioner.

A motion was filed before the Examiner of Interferences to suppress the deposition of one King, taken on behalf of Daggett. This motion was based on the grounds entered upon the record by counsel for Wright at the time such deposition was taken; but the motion was not urged until the hearing, and was not decided until the decision was made upon the merits of the case. The Examiner of Interferences suppressed the deposition and awarded priority to Wright, as said above. On appeal the Examiners-in-Chief, following the equity practice in cases of this character, regarded the admissibility of the deposition as open for their consideration, and, as I understand, saw proper to consider it as a part of the evidence.

When the action of the Examiner of Interferences in suppressing a deposition is made part of his final decision upon the merits of the case, I think the better practice is to regard such question as a part of the merits, to be passed upon by each of the appellant tribunals as they may adjudge to be proper. Ordinarily, such motions should be disposed of preliminarily, so as to enable the party whose deposition has been suppressed to retake it if possible.

It appears from the record in this case that the witness King lived in Montague, Mich., and came to Chicago at the request of Daggett for the purpose of giving his deposition without being formally subpœnaed; that after his examination-in-chief was concluded counsel for Wright proceeded to cross-examine him. The cross-examination occupied several days and was long and wearisome; much of it was wholly irrelevant, and in some portions there are indications of a purpose to prolong unnecessarily the examination and to wear out the witness. Finally, on Friday night, the witness advised the officer and the attorneys that he had received information of his wife's illness, and that his business seriously required his attention, and urgently requested that counsel for Wright would make every reasonable effort to conclude the cross-examination on that day. The counsel who was conducting the cross-examination, while stating that he did not desire to unnecessarily detain the witness, manifested no attempt to expedite matters, but insisted upon adjourning and that the witness should come back on the following day. An evening session was suggested; but this the examining attorney would not accede to. The cross-examination was resumed and continued until 5:50 p. m., when witness himself requested counsel for Wright to proceed, stating that he was compelled to go home that night, and expressed a willingness to stay and testify until 9 p. m., but that he should refuse to come back to testify. This latter statement he afterward qualified by saying that he was willing to return at such time as would not interfere with his business, but would not name any exact date. At 7:40 p. m. counsel for Wright stated that he had material questions to ask the witness, which he could not complete by 9 p. m., and requested an adjournment until 9:30 or 10 a. m. on the next day. At this stage, when an adjournment was decided upon, counsel for Daggett requested the witness to sign the record and to present himself at 10 a. m. the next day if he should be in the city. Counsel for Wright objected to witness signing the record, and insisted that he was not through with his cross-examination, and that the witness must be present on the next day at the hour named in the adjourn-

ment. The witness signed his examination, but did not appear the next day, nor has he ever since presented himself or been called upon, so far as the record shows, although counsel for Wright had expressed a willingness to adjourn until some future day upon which the witness would agree to return and testify.

An examination of the record convinces me that if the case had been on hearing before a judge such a long and unnecessarily prolix examination would not have been permitted. The court would have assumed the authority of closing the cross-examination, unless the attorney could confine himself to more reasonable limits. There is nothing in the record showing what additional questions or to what matter the counsel desired to direct the attention of the witness by further examination, nor does it appear in what way he has been injured or his rights affected by a failure to cross-examine, except, broadly, that he has not examined to his heart's content.

It is clear that Daggett is in nowise responsible for the failure to complete this cross-examination. The witness himself appears to have been candid and patient, and the only cause for the failure is the length of the cross-examination.

It is well settled that when a party has had an opportunity to cross-examine a witness and has neglected to do so the case is the same in effect as if he had cross-examined, for otherwise, as observed by Lord Ellenborough, the admissibility of the evidence would be made to depend upon his pleasure whether he would cross-examine or not, which would be a most uncertain and unjust rule.

The matter of suppressing a deposition rests largely in the discretion of the tribunal to which it is offered:

> In equity it seems that a deposition is not of course inadmissible, even if there has been no cross-examination and no waiver of the right. Thus, if a witness, after being examined on the direct interrogatories, should refuse to answer the cross-interrogatories, the party producing the witness will not be deprived of the benefit of his direct testimony, for upon application to the court the witness would have been compelled to answer. But if the witness should secrete himself to avoid a cross-examination, there the court might suppress the direct examination. In such case a cross-examination is still possible, and the very conduct of the witness in secreting himself has a just tendency to render his direct examination suspicious. (Weeks' Law of Depositions, § 493, and cases cited.)

It is to be remembered that the Commissioner of Patents had no power in the matter of taking testimony of witnesses, no control over the taking of their depositions, nor over their conduct while such depositions are being taken. The whole matter is left in the hands of the Federal courts of the district in which the testimony is being taken, and either of the parties has full authority to apply to the district judge for orders compelling the attendance and controlling the conduct of witnesses. In this case, had counsel for Wright been anxious to cross-examine this witness and to complete such cross-examination, he could have applied to the judge of the district court; or, if the witness had passed beyond jurisdiction into another State, he could have applied there and have obtained an order for the final cross-examination, and I have no doubt that if he had seriously desired to complete this examination an arrangement could have been made to effect it.

Taking the case altogether, I am of opinion that the deposition ought not to have been suppressed. In thus holding I do not mean to say that a witness can at any time become the judge as to whether a cross-examination has passed beyond legitimate bounds and excuse himself from further attendance, for this cannot be recognized for a moment; but when a deposition taken under these circumstances has been filed before the court or before the Office, I am satisfied that before it will be suppressed the court will look into the character of the deposition, and from that determine whether the aggrieved party ought not to have taken some other method of curing the evils complained of than resorting to a motion to suppress, and especially is this true in the Office of the Commissioner of Patents, where, as just stated, there is no power or authority to rectify matters of that kind.

The issue in this case is defined as follows:

> The actuating-cams and the shaft thereof, in combination with the former and plunger projecting between and engaging said cams, substantially as described.

The invention is of such a character that when the inventor had conceived the movement of the former and the plunger projecting between, both operated by engagement with cams arranged face to face, the conception was complete, and all that remained relative to the arranging and adjusting of the slots of the cams and of the cams upon the shaft so as to time the movement of the former and the plunger constituted nothing but mechanical work. The principle of the cam is so thoroughly understood and so familiar and common that, having once conceived the broad idea of operating the former and the plunger by means of two cams upon the same shaft, the invention was complete and the reduction to practice in the arrangement of the cams, as just stated, involved nothing but the skill of a mechanic.

It appears that Daggett had been familiar with machines of this class for some years and had operated them. His attenton was turned to improvements upon them, and I think the evidence is very satisfactory that he had conceived the invention before he came to Chicago and was brought into business relations with Wright. On the other hand, Wright had never had anything to do with mechanism of this character until he met Daggett, had never given it a thought, and had made no attempts whatever to construct that kind of machinery or to make improvements in that direction.

The question presented in the conflicting evidence introduced by both parties is really one of originality—which of these two was the first to conceive this invention and disclose it to the other. I am not going into the evidence, for that has been done by the Examiners-in-Chief and in a manner entirely satisfactory to me. I am satisfied that the evidence, when fairly and properly considered, establishes the fact that Daggett, having conceived this invention, submitted the subject to Wright for the purpose of inducing him to use his skill as a mechanic to attempt to construct a model or machine in which the two cams would be used upon a shaft to operate the former and plunger, but that Wright was for some time unable to do it. The two men worked together, consulted with each other, and Wright probably had more to do in giving directions to the artisans who finally constructed the machines than Daggett did; but in all this his relation was simply that of an agent or mechanic who was constructing a machine according to the plan and conception of the man who had invented it.

I affirm the decision of the Examiners-in-Chief in awarding priority of invention to Daggett.

FAURE v. BRADLEY AND CROCKER v. COWLES AND COWLES.

Decided August 14, 1888.

STATEMENT.

Motion to dissolve interferences for the following reasons: *First*, that the foreign patents set forth by Faure in his preliminary statement are not patents for the invention in issue. *Second*, that the invention in issue is a broader invention than that patented to Faure in the foreign patents set forth in his preliminary statement, and that on the principle of reissues he is barred from making claims broader than those contained in his foreign patents.

1. FOREIGN PATENTS—EVIDENCE.

The question whether the invention covered by foreign patents is the same as that involved in interference, and therefore that such patentee is not entitled to the dates of such foreign patents, must be determined by the evidence adduced on the trial. The Examiner of Interferences has the exclusive right to determine the competency, construction, scope, and legal meaning of the foreign patents or of any other evidence introduced and to decide whether they cover the same invention as that involved in the interference.

2. LIMITED CLAIMS IN FOREIGN PATENTS NOT A BAR.

Foreign patents containing limited claims will not bar an applicant from securing in this country claims for a broader invention, provided he can maintain and substantiate them in an interference contest.

3. DUTIES OF EXAMINER OF INTERFERENCES DISTINGUISHED FROM PRIMARY EXAMINER.

The Examiner of Interferences is a Primary Examiner; but under the organization of the Patent Office the examiner in charge of the interference possesses no jurisdiction over the question of the patentability of the inventions or the declaration of interferences, but he has exclusive jurisdiction of the trial of the issues when declared. The Primary Examiner when considering the merits of an application or declaring an interference must look alone to the language of the applications.

4. MOTION TO DISSOLVE CANNOT BE PREDICATED UPON PRELIMINARY STATEMENT.

The application is the procedure to obtain a patent, and, strictly speaking, a motion to dissolve an interference cannot be predicated upon something found in a preliminary statement, or anything *dehors* the application.

5. NO APPEAL FROM DECISION AFFIRMING "RIGHT TO MAKE THE CLAIMS."

The Primary Examiner having held that Faure had the right to make the claims and was not barred by the state of the art or publications, he could not do otherwise than overrule the motion to dissolve. From such decision no appeal lies.

APPEAL on motion.

ELECTRIC FURNACES AND METHODS OF OPERATING THE SAME.

(Interference No. 12,615.)

Application of Camille A. Faure filed May 10, 1886, No. 201,687. Patent granted Charles S. Bradley and Francis B. Crocker February 2, 1886, No. 335,499. Patent granted Eugene H. Cowles and Alfred H. Cowles June 9, 1885, No. 319,795.

Mr. Alfred Shedlock for Faure.

Messrs. Paine & Ladd for Bradley and Crocker and for Cowles and Cowles.

HALL, *Commissioner:*

On the 16th of November, 1886, Interference No. 11,064 was declared between the patents of Bradley and Crocker and Cowles and Cowles and Faure's application. A motion was made to dissolve this interference upon the ground that in view of certain foreign patents to Faure he had no right to make the claims set forth in his pending application. This motion, having been remanded to the Primary Examiner, was by him refused. An appeal taken from this decision to the Examiners-in-Chief was dismissed for want of jurisdiction, whereupon an appeal was taken to the Commissioner, who, in a decision dated June 10, 1887, dismissed the appeal on the ground that no appeal could be taken from such a decision. (See *Faure* v. *Bradley and Crocker* v. *Cowles and Cowles*, 40 O. G., 243.) Afterward it appears that this interference was dissolved *pro forma*, and the three pending interferences were simultaneously declared January 18, 1888, viz:

The present interference, No. 12,615, including the application of Faure, filed May 10, 1886, No. 201,687, patent to Bradley and Crocker, granted February 2, 1886, No. 335,499, and patent to Cowles and Cowles, granted June 9, 1885, No. 319,795, title, "electric furnaces and methods of operating the same." Interference No. 12,616, including the application of Faure, filed May 10, 1886, No. 201,688, and patent to Bradley and Crocker, granted February 2, 1886, No. 335,499, title, "reducing substances by means of electricity." Interference No. 12,618, including the application of Faure, filed May 10, 1886, No. 201,687, and patent to Cowles and Cowles, granted June 9, 1885, No. 319,795, title, "electric furnaces and methods of operating the same."

It is unnecessary to set out the issues.

In his preliminary statement, Faure, who is a foreigner and whose invention was made in a foreign country, sets up as his dates of invention patents issued to him in England in 1882 and 1883, and depends upon the dates of such patents under a well-settled rule of law.

March 9, 1888, Bradley and Crocker and Cowles and Cowles filed a motion to dissolve these interferences for the following reasons: *First*, that the foreign patents set forth by Faure in his preliminary statement are not patents for the invention in issue. *Second*, that the invention in issue is a broader invention than that patented to Faure in the foreign patents set forth in his preliminary statement, and that on the principle of reissues he is barred from making claims broader than those contained in his foreign patents.

This motion was sent to the Primary Examiner and denied by him, and now the parties moving have appealed to the Commissioner. Faure's attorneys have filed a motion to dismiss the appeal for the reason that no appeal lies from a decision of the Primary Examiner holding that he (Faure) has the right to make the claims. The question presented is whether such an appeal lies from the action of the examiner.

It is difficult if not impossible to see why the former decision of the Commissioner of June 10, 1887, is not conclusive of the present appeal. The Primary Examiner in considering the former motion held that the interference was properly declared and that Faure had the right to make the claims. Even though Faure took out foreign patents upon too limited claims, that fact would not bar his right to make broader claims here if he could maintain and substantiate them in an interference contest. Having held that Faure had the right to make the claims and was not barred by the state of the art or publications, he could not do otherwise than overrule the motion to dissolve, as the present interference in three counts is practically the same as the original interference. But Cowles and Cowles and Bradley and Crocker insist that they have a right to appeal to the Commissioner from such decision, because—

the decision to the effect that the invention covered by his (Faure's)

foreign patents is different from the inventions in issue is not a decision denying the right of Faure to make the claims. It is only a denial that his pending applications, when read, as they must be read, in the light of his foreign patents, describe and claim the inventions in interference. It leaves him absolutely free to make the claims, like other inventors, either on an invention made by him in the United States or on an invention made by him abroad and imported into the United States.

The difficulty with this view of the subject is that it confounds the duties of the examiner who declares the interference with those of the examiner who tries it. The Examiner of Interferences is a Primary Examiner; but under the organization of the Patent Office the examiner in charge of the interference possesses no jurisdiction over the question of the patentability of the inventions or the declaration of interference, but he has exclusive jurisdiction of the trial of the issues when declared. The Primary Examiner, when considering the merits of an application or declaring an interference, must look alone to the language of the applications. The application is the procedure to obtain a patent, and, strictly speaking, a motion to dissolve an interference cannot be predicated upon something found in a preliminary statement, or anything *dehors* the application.

Much is said in the argument in this case about reading Faure's application in the light of his foreign patents; but this is an inapt manner of stating the matter. His application cannot be read in any other light than its own for the purpose of declaring or dissolving an interference. The application is the absolute foundation of the applicant's rights. It would be strange, indeed, if the claims of an application could be modified or limited by some other document or statement. Such an idea seems controverted by the appellants, Bradley and Crocker and Cowles and Cowles, in the very proposition submitted, for they concede that Faure must be left absolutely—

free to make the claims, like other inventors, either on an invention made by him in the United States or on an invention made by him abroad and imported into the United States.

Then we must be bound by his application and nothing else in declaring an interference, and so, also, in considering a motion to dissolve. Faure's foreign patents cannot affect the phraseology of his specifications or broaden or limit the claims which are set forth in his application. The application comes into the Office alone, without luggage or companionship, and it must be so regarded at all stages until it is rejected or allowed.

What, then, is the proper course in view of the questions presented by Bradley and Crocker and Cowles and Cowles? They insist that the invention covered by Faure's foreign patent is not the same as that involved in the issues in interference, and that therefore Faure is not entitled to the dates shown by them in this contest. If this be true, no one will deny that Faure cannot avail himself of the dates of those foreign patents; but how are we to determine if it be true that the foreign patents do not cover the same invention? Appellants say we desire to establish the fact before the Primary Examiner on a motion to dissolve, and if he holds against us on the fact then we claim the right to appeal to the Commissioner and take his ultimate judgment. But the complete answer to this is that such a question relates to a consideration of the evidence adduced on the trial of the issue in interference, with which the Primary Examiner has nothing to do. The latter declares the issue in interference upon the statements of the application, which set forth only that the applicant claims to be the first original inventor, with a description of the invention. When this interference, declared upon the application alone, is made, the jurisdiction of the Primary Examiner ceases and the case goes to the Examiner of Interferences for more specific (preliminary) statements as to dates of invention and for evidence and trial—allegation, proof, and decision. If after a preliminary statement had been received or some of the proof had come in one of the parties should move to dissolve because something in the statement or proof showed that one party could not take as early a date as claimed in the preliminary statement and ask to have his motion referred to the Primary Examiner to decide, it would be an attempt to ask the Primary Examiner to exercise the jurisdiction of the Examiner of Interferences and decide a question of priority upon a part of the evidence only.

Now, Faure has pleaded the dates of his foreign patents as the dates of the invention involved in these issues. He has the right to bring in those patents as evidence in support of his allegation. They either will or will not support it. He also has a right to bring in with them the English law to show the legal effect and construction of those patents, so that the Office may know just what invention is covered by them, what is the meaning, breadth, scope, and extent of the claims, &c. This whole subject belongs to the Examiner of Interferences as a trial court and is entirely foreign to the jurisdiction of the Primary Examiner, who declares the interference. The Examiner of Interferences has the exclusive right to determine the competency, construction, scope, and legal meaning of the foreign patents or of any other evidence introduced, and to decide whether they cover the same invention as that involved in the interference. If he finds they do not, Faure is left to stand upon his record date, or such evidence as he may introduce as to disclosure, &c., in the United States, if he relies upon that in his preliminary statement. If Bradley and Crocker and Cowles and Cowles desire, they may submit the case upon the record of Faure's British patents and raise the question by a sort of demurrer to the evidence; but even then the case must go to and be tried by the Examiner of Interferences and not be determined by a motion to dissolve, which must be remanded to and be decided by the Primary Examiner declaring the interference.

The foreign patents of Faure are not yet in evidence. They have simply been set up in his preliminary statement as entitling him to their dates as his earliest dates of invention. In interference proceedings we do not have formal pleadings, demurrers, &c. No demurrer to this preliminary statement is recognized; and, more than this, the statements are not expected to be drawn with the same particularity as formal bills and answers in equity. Many things—such as the statutes and practice of foreign countries relating to patents issued thereby—may be shown in evidence, though not formally pleaded. Faure would be entitled to introduce this evidence if he desired, so that I see no way in which the questions presented by the present motion can be raised properly except upon the merits of the interference after all the evidence is in. If on such hearing the Examiner of Interferences should hold that the foreign patents do cover the same inventions as those involved in the issues, an appeal would bring the whole question before the Examiners-in-Chief and the Commissioner.

Much is said in argument about the question of *res adjudicata*. It must be apparent from what has been said above that no question of law or fact relating to priority of invention, or to whether the inventions covered by the foreign patents are identical with the subject-matter of the present issues, has as yet been decided. The Primary Examiner has had no proper jurisdiction of either of these questions, his jurisdiction being limited to the consideration of the sole question whether, upon the face of the applications and the patents of the respective parties, there is a legitimate interference. He has held that there was, and so the motion to dissolve the interference was overruled. Not having the right to decide upon the legal effect of the foreign patents as evidence and not having made a decision as to that, there can be no appeal from him upon such a question, so that no such matter has been passed upon or has become *res adjudicata*, and all questions as to the operation, construction, and effect of Faure's foreign patents are still open in all particulars, and will be disposed of in the regular order of trial when the cases shall be heard on their merits.

The appeal is dismissed.

THE
OFFICIAL GAZETTE
OF THE
United States Patent Office.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Fraudulent Practices by Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 18, 1888.

The attention of this Office having frequently been called to circulars and communications of persons pretending to have access to the records of this Bureau, and claiming to possess information of the pendency of applications for patents, notice is hereby given the public that all such persons in so advertising themselves are acting under false representations and are guilty of unprofessional conduct, and should not be entitled to credit.

The Office has also received information that certain attorneys disbarred from practice under section 487 of the Revised Statutes are continuing to prosecute applications for patents under the names of other persons.

Hereafter a list will be published in the OFFICIAL GAZETTE containing the names and addresses of all such persons, and the public warned against employing them or intrusting applications or interests to their charge.

BENTON J. HALL, *Commissioner.*

The Office has information that *Isaac S. McGiehan, No. 155 Broadway, New York*, a disbarred attorney, has been practicing under the name of *Alexander Melhado.*

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send their publications that not less than three copies should be forwarded in order that the subjects may be properly indexed, classified, and subclassified in the Scientific Library for convenient and ready reference.

Issue of August 28, 1888.

DESIGNS.

18,559.—CARPET.—*Morton F. Beale*, Boston, assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Application filed July 23, 1888. Serial No. 280,801. Term of patent 3½ years.

18,560.—FONT OF TYPE.—*Henry Brehmer*, New York, N. Y., assignor to *David Wolfe Bruce*, same place. Application filed July 12, 1888. Serial No. 279,985. Term of patent 14 years.

18,561.—CHECKREIN-HOOK.—*George S. Cascaden*, Phœnixville, Pa. Application filed March 14, 1888. Serial No. 267,186. Term of patent 14 years.

18,562.—SURFACE ORNAMENTATION OF WALLS.—*Louis Clémencet*, West Hoboken, N. J., assignor to *Warren, Lang & Co.*, New York, N. Y. Application filed August 3, 1888. Serial No. 281,891. Term of patent 3½ years.

18,563 to 18,565, inclusive.—CARPET.—*Edwin Fisher*, New York, N. Y., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Applications filed July 23, 1888. Serial Nos. 280,818, 280,819, and 280,824. Term of patents 3½ years.

18,566.—BASKET.—*William Haley*, Beaver Falls, Pa. Application filed August 3, 1888. Serial No. 281,914. Term of patent 14 years.

18,567 to 18,569, inclusive.—CARPET.—*Henry Horan*, East Orange, N. J., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Applications filed July 23, 1888. Serial Nos. 280,798 to 280,800, inclusive. Term of patents 3½ years.

18,570.—CARPET.—*Winthrop L. Jacobs*, East Orange, N. J., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Application filed July 23, 1888. Serial No. 280,797. Term of patent 3½ years.

18,571.—CAMPAIGN BUTTON.—*Joseph M. Jones*, Paris, Ky. Application filed July 27, 1888. Serial No. 281,140. Term of patent 3½ years.

18,572.—BOTTLE.—*Alfred Kohn*, Chicago, Ill., assignor to *Glaser, Kohn & Co.*, same place. Application filed July 18, 1888. Serial No. 280,337. Term of patent 3½ years.

18,573.—CORSET.—*Joseph Koon*, New Haven, Conn., assignor to *Lewis Schiele & Company*, New York, N. Y. Application filed July 16, 1888. Serial No. 280,100. Term of patent 14 years.

18,574.—CAMPAIGN BUTTON.—*Rudolph Liebmann*, New York, N. Y. Application filed July 26, 1888. Serial No. 281,131. Term of patent 3½ years.

18,575 to 18,578, inclusive.—CARPET.—*Edward Poole*, New York, N. Y., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Applications filed July 23, 1888. Serial Nos. 280,805 to 280,808, inclusive. Term of patents 3½ years.

18,579.—FAN, HANDKERCHIEF, &c.—*Daniel Rhodes*, Washington, D. C. Application filed July 25, 1888. Serial No. 281,021. Term of patent 3½ years.

18,580.—BISCUIT OR CRACKER.—*David F. Stauffer*, York, Pa. Application filed February 7, 1887. Serial No. 226,879. Term of patent 14 years.

18,581.—METAL PLATE—*Thomas Stone* and *George M. Stone*, Newark, N. J., assignors to *Hall & Carpenter*, Philadelphia, Pa. Application filed June 27, 1888. Serial No. 278,350. Term of patent 7 years.

18,582.—HANDKERCHIEF.—*Henry G. Worthington*, Washington, D. C. Application filed June 12, 1888. Serial No. 276,883. Term of patent 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

15,808.—ZEPHYR-FINISH GERMANTOWN WOOL.—*Isaac D. Allen & Co.*, Boston, Mass. Application filed June 30, 1888. Used since October 28, 1884.

"The word 'BERNHARDUS' and the representation of a ram's head."

15,809.—PULMONARY SIRUP FOR HUMAN USE.—*William Robert Ashurst*, Farningham, county of Kent, England. Application filed May 18, 1888. Used since February 1, 1888.

"The representation of a horse rampant."

15,810.—COMPOUND OF SULPHATE OF QUININE, SULPHURIC AND SALICYLIC ACIDS, ALCOHOL, AND COCHINEAL.—*Theodore Blank*, St. Louis, Mo. Application filed May 5, 1888. Used since August 17, 1880.

"The representation of a crown with four arches and one middle piece, of which each arch has ten shaded circles and the middle piece five shaded circles, which represent precious stones."

15,811.—GUNPOWDER, AMMUNITION, AND EXPLOSIVES.—*Charles W. Curtis*, London, England. Application filed July 11, 1888. Used since 1880.

"The word 'DIAMOND.'"

15,812.—CERTAIN NAMED MEDICAL REMEDIES.—*Frederick Eberlein*, Chicago, Ill. Application filed June 30, 1888. Used since January, 1888.

"The word 'KOENIG'S.'"

15,813.—PORTLAND CEMENT.—*John C. Gostling & Company*, (*Limited*,) London, England, and New York, N. Y. Application filed November 29, 1887. Used since August 13, 1875.

"The words 'PORTLAND CEMENT' and the representation of the globe with an equatorial band or belt."

15,814.—EMBOSSED SHEET-METAL STOVE-BOARDS.—*A. Irving Griggs*, New York, N. Y. Application filed July 13, 1888. Used since May, 1887.

"The word 'DAISY.'"

15,815.—MINERAL CEMENT.—*Kaw Valley Cement Company*, Kansas City, Mo. Application filed June 26, 1888. Used since June 13, 1888.

"A diamond or lozenge shaped figure inclosing the letter 'F.'"

15,816.—LAGER-BEER, FLUID MALT, EXTRACT OF MALT, AND A MALT PREPARATION.—*The G. Manz Brewing Company*, Philadelphia, Pa. Application filed June 21, 1888. Used since February 20, 1888.

"The representation of a flag with eleven alternate red and white stripes and thirteen stars on a blue field, and bearing the words 'UNCLE SAM,' and a diamond-shaped figure in the middle of the flag, inclosing the conventional representation of Uncle Sam."

15,817.—CURE FOR CERTAIN NAMED DISEASES.—*Paul John Muilberger*, Springfield, Mo. Application filed March 12, 1888. Used since January 15, 1888.

"The words 'RED LIGHT' and the representation of a railroad-lantern with a red globe."

15,818.—HEAVY SHOES FOR MEN.—*Puckard & Grover*, Brockton, Mass. Application filed June 23, 1888. Used since May 20, 1888.

"The figure of a man in the common uniform of a policeman, with a club in his hand."

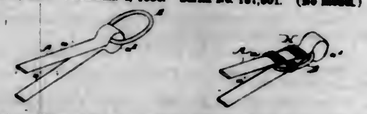
15,819.—OINTMENT OR SALVE.—*Samuel Richard Payne*, Athens, Pa. Application filed May 22, 1888. Used since April 30, 1888.

"The word 'MONARCH.'"

15,820.—NON-ALCOHOLIC BEVERAGE CONTAINING FRUIT PROPERTIES.—*Charles H. Sagar*, Auburn, N. Y. Application filed July 24, 1888. Used since January 8, 1888.

"The word 'FRUL.'"

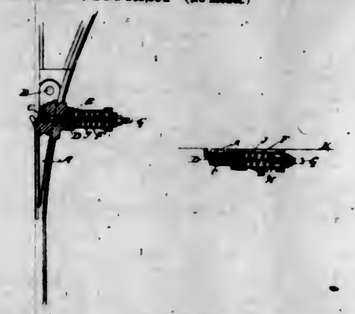
LABELS.



5,683.—Title: "THUJA SOAP."—*Charles F. Lord*, New York, N. Y. Application filed July 9, 1888.

5,684.—Title: "WADLEIGH'S LITTLE VEGETABLE PILLS."—*F. R. Wadleigh*, Alton, N. H. Application filed August 3, 1888.

PATENTS



GRANTED AUG. 28, 1888.

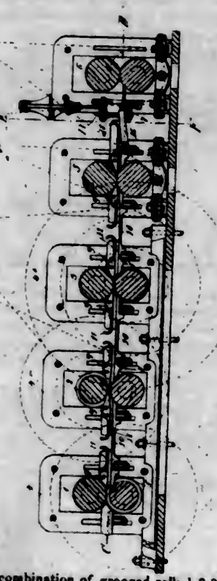
388,387. **HAIR-CRIMPER.** NATHANIEL ALLEN, Lowell, Mass., assignor, by mesne assignments, of one-half to Abbie R. York, trustee, same place. Filed Jan. 4, 1888. Serial No. 257,991. (No model.)

Claim.—The combination of the crimper formed of a strip having rounded edges and doubled upon itself and bent at its closed end into a circle or closed loop, and an elastic band looped into said circle or closed loop, as and for the purpose specified.

388,388. **TRAMWAY-SWITCH.** CHARLES R. ANDERSON, Denver, Colo., assignor to Augustus L. Perry, same place, Demmore H. Sanders, Salt Lake City, Utah, and William H. Johns, Sioux City, Iowa. Filed Feb. 27, 1888. Serial No. 265,334. (No model.)

Claim.—1. In a street-tramway switch, the combination of a movable tongue or point, a spiral spring, a mechanical connection from the spring to the tongue below the level of the latter, a closed box or casing containing the spring and secured directly to the frog, and a screw for adjusting the tension of the spring, substantially as set forth.

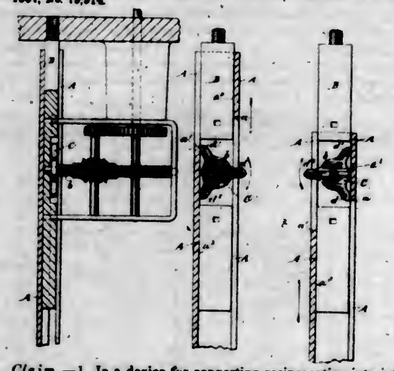
2. In a street-tramway switch, the combination of a movable tongue, A, a pin, C, a rod, D, with disk E, a closed box or casing, F, with lid and adjustable screw G, and disk H, together with a spiral spring, J, substantially as and for the purpose described.



388,389. **ROLLING-TRAIN.** WILHELM RAMSER, Kattowitz, Silesia, Prussia, Germany. Filed Jan. 24, 1888. Serial No. 261,771. (No model.) Patented in Germany June 18, 1887, No. 43,941; in England July 4, 1887, No. 9,647; in Belgium July 4, 1887, No. 78,056; in France July 4, 1887, No. 184,897, and in Luxemburg Jan. 12, 1888, No. 843.

Claim.—1. In a rolling-mill, the combination of grooved rolls 1, 2, and 3, with a dressing-roll, 5, and a polishing-roll, 6, all arranged one behind the other, the last-mentioned rolls 5 and 6 being movable in the direction of their axles, substantially as described and shown.

2. In a rolling-mill, the combination of the grooved rolls 1 2 3 and the dressing-roll 5 and the polishing-roll 6, with the guides 8 and 9, the lower, 8, being provided with a fixed bridge, 10, leading to the next roll, and the upper, 9, with hinge-like fastened guide levers or bars 11, opening upward, for the purpose as described.



3. In a rolling-mill, the combination of grooved rolls 1 2 3, dressing-rolls 5, polishing-rolls 6, guides 8 9, with cog-wheels 12 and 13 and conical-shaped pulley-drums 14 15, all substantially as described.

388,389.

4. In a rolling-mill, the combination of grooved rolls 1 2 3, cog-wheels 12 13, guides 8 9, dressing-rolls 5, polishing-rolls 6, and conical-shaped pulley-drums 14 15, with a scraper, 7, substantially as described and shown.

388,390. **MECHANICAL MOVEMENT.** CHARLES C. BARTON, Edinburgh, Scotland. Filed Oct. 19, 1887. Serial No. 252,862. (No model.) Patented in France Dec. 13, 1887, No. 187,572, and in Belgium Dec. 14, 1887, No. 79,914.

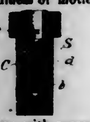
Claim.—1. In a device for converting reciprocating into intermittent rotary motion, a reciprocating bar provided with a shoulder and a bearing-face, in combination with an angular wheel arranged

to be turned by the contact of said shoulder and to be locked by the said face, substantially as described.

2. In a device for converting reciprocating into intermittent rotary motion, an angular wheel, in combination with a reciprocating bar provided with a shoulder and with a bearing-face on opposite sides of said wheel, the shoulders being arranged to alternately contact with and turn the wheel, and the bearing-faces to alternately lock the wheel against rotation after each movement by one of the shoulders, substantially as described.

3. In a device for converting reciprocating into intermittent rotary motion, an angular wheel, in combination with a reciprocating bar provided with bearing-faces a^3 a^3, having shoulders a a', arranged on opposite sides of the wheel and one in advance of the other, substantially as described.

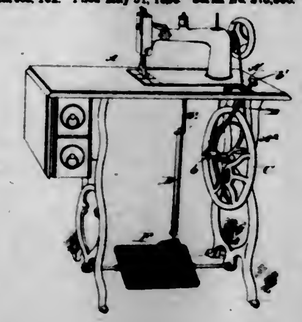
4. In a device for converting reciprocating into intermittent rotary motion, the combination of the frame-piece B, the angular wheel C, having its shaft journaled in piece B, and the reciprocating sheath partially surrounding and guided by the frame-piece B and provided with bearing-faces having shoulders a a' projecting into the paths of the angular portions of the wheel, substantially as described.



388,391. **SHIFTING SEAT FOR VEHICLES.** Ebony H. Bates, Washington, D. C. Filed Sept. 16, 1886. Serial No. 213,697. (No model.)

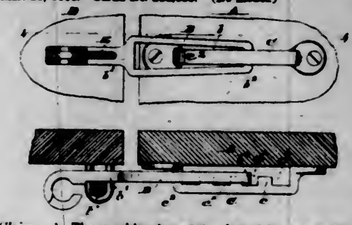
Claim.—The combination, with the bar a, pivoted to the rear seat and fulcrumed at b, and the bar d, pivoted at e to the extended end c, of the rear seat-bar, the bars f and i, pivoted to the front seat, crossing one another, as shown, the forward and lower end of the bar i being pivoted on the vehicle-body and the lower end of the bar f to the bar d, for the purpose set forth.

388,392. **STEP FOR SPINNING-SPINDLES.** John Booth, Central Falls, R. I. Filed Aug. 1, 1887. Serial No. 245,757. (No model.) Patented in England Mar. 15, 1887, No. 3,965.



Brief.—The object of the invention is to provide a spindle-step which shall be efficient, durable, and economic of manufacture, and shall obviate any undue unsteadiness of motion of the spindle, while allowing slight lateral play.

Claim.—1. The combination, with a case, of a step of hard or vulcanized rubber rigidly secured at substantially its lower end in the case, the point at which the foot of the spindle is seated in the step being an appreciable distance above that at which the step is rigidly secured in the case, as set forth.

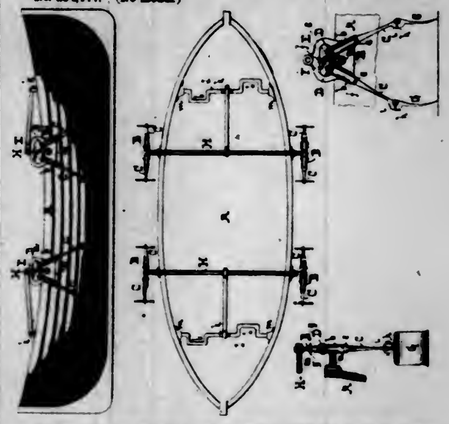


2. The combination, with a case, of a step of hard or vulcanized rubber rigidly secured at substantially its lower end in the case, the point at which the foot of the spindle is seated in the step being an appreciable distance above that at which the step is rigidly secured in the case, and the bore of the case above the point at which the step is secured therein being considerably larger than the diameter of the step, as set forth.

388,393. **MOTOR FOR SEWING-MACHINES.** Emma F. Burgess, San Marcos, Tex. Filed May 31, 1888. Serial No. 275,660. (No model.)

Claim.—In an attachment for the stand of a sewing-machine adapted for interchangeable motors, the depending hook designed to receive and support when out of use either the pitman or the inclined hand-rod, substantially as described.

388,394. **HASP-LOCK.** Lewis A. Brown, St. Louis, Mo. Filed Mar. 20, 1888. Serial No. 268,088. (No model.)



Claim.—1. The combination of the slotted hasp and the notched elongated staple C, substantially as described.

2. The combination of the door, the slotted hasp, the elongated notched staple C, the jamb D, the staple E, and fastening F, substantially as described.

3. The combination of the part A, the hasp B, having the slot b wider at one end than at the other, as described, and the notched elongated staple C, as described.

388,395. **PROPELLING APPARATUS FOR BOATS.** Alfred Buck and Augustus Burkhard, Baltimore, Md. Filed Nov. 3, 1887. Serial No. 254,177. (No model.)

Claim.—In combination with a boat, a stud projecting laterally from the side thereof, a frame resting on the said stud so as to vibrate on the same, the said frame having sockets which diverge in a downward direction, arms carrying independently-vibrating paddles, which arms pass loosely through the said sockets, a beveled cog-wheel at the upper end of each arm, a central beveled cog-wheel on a rotative stem in gear with the cog-wheels on the two arms, and a spring-handle attached to the said stem with its outer end adapted to lock with a part of the said frame, substantially as and for the purpose specified.

388,396. **CAR-COUPLING.** Howard H. Burden, Troy, N. Y. Filed Feb. 15, 1888. Serial No. 264,127. (No model.)

Claim.—1. In a car-coupling, the combination, with a frame and movable knuckle, of a lever or its equivalent arranged to operate upon the knuckle to throw it open, substantially as and for the purposes set forth.

2. In a car-coupling, the combination of a frame, movable knuckle and locking-pin, with a lever or its equivalent arranged to operate upon the knuckle to throw it open, as and for the purposes set forth.

3. In a car-coupling, the combination, with a frame, movable knuckle, and locking-pin, of a lever or its equivalent arranged to operate upon the knuckle to throw it open, and a device arranged to operate both locking-pin and lever, as and for the purposes set forth.

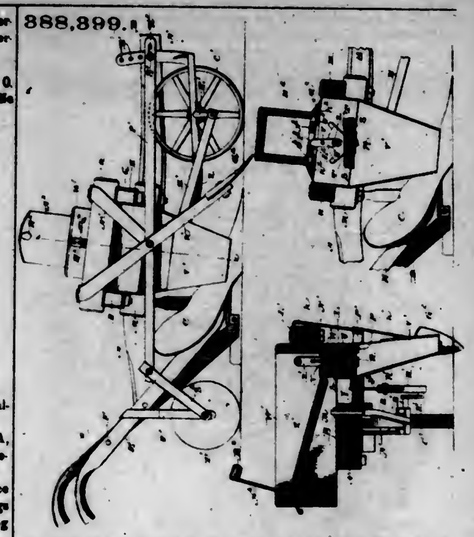
388,397. **PORTABLE FROG OR CAR-REPLACER.** William O. Cook, Chicago, Ill. Filed May 19, 1888. Serial No. 273,916. (No model.)

Claim.—1. A portable frog or car-replacer provided with a shoulder for raising blind-wheels, substantially as described.

2. In a portable frog or car-replacer, the combination of piece A, having shoulder E, with piece B secured thereto, substantially as described.

3. In a portable frog or car-replacer, the combination of piece A, having shoulder E and lug F, with piece B, having lug F', the lugs fitting into the grooves in the sides of the rail and preventing the frog from tilting or tipping, substantially as described.

388,398. **COTTON SCRAPER AND SWEEP.** William R. Crain, Columbia, Tenn. Filed May 26, 1888. Serial No. 275,099. (No model.)



Claim.—1. The combination of the beam A, the yokes C on opposite sides thereof, said yokes having the right-angled arms D and the oblique arms E, the latter being bolted at their outer ends to the beam, the beams N, pivoted to and laterally adjustable on the arms D of the yokes, and the extensible arms G, connecting said beams to the beam A, substantially as described.

2. The combination of the beam A, the yokes C on opposite sides thereof, said yokes having the right-angled arms D and the oblique arms E, the latter being bolted at their outer ends to the beam, the beams N, pivoted to and laterally adjustable on the arms D of the yokes, the arms G, secured to and laterally adjustable on the beam A and having the vertical curved standards H at their outer ends, provided with the adjusting-opening I, the bolts L, engaging said openings and the beams N, and thereby adjustably securing said beams to said standards, the handles having the front ends pivotally connected to beam A, and the brace-rods pivoted to said handles and to the beams N, as set forth.

388,399. **PLANTER.** John A. Cummins, Crawford, Nebr. Filed July 8, 1887. Serial No. 243,733. (No model.)

Claim.—1. The combination, with a plow, of the frame G, attached to the plow-beam and projecting laterally therefrom, the said frame having the hopper, the pivoted adjustable bottom board, Z', and the box L, the shaft R, journaled in the said box, the segmental block S, attached to the said shaft and arranged in the box or cups, the crank-arm P, attached to the inner end of the shaft, the arm Z, having its rear end pivotally attached to the frame G, the said arm carrying the wheel C and being provided at its front end with the upturned portion A', bolted to the front end of the plow-beam, the shaft of wheel C, having the crank-arm, and the pitman connecting the said crank-arm to the crank-arm P, substantially as described.

2. The combination, in a planter, of the frame G, adapted to be attached to the beam of the plow and having the planting mechanism, the standard K', attached to the outer end of frame G, laterally adjustable thereon, and adapted for the attachment of the furrow-opener, the plates N', connecting the said standard to the frame, and also laterally adjustable on the latter, the arm Z, having its rear end pivotally connected to the frame G, the wheel C, journaled in the said arm, and actuating-connections between said wheel and the planting mechanism, substantially as described.

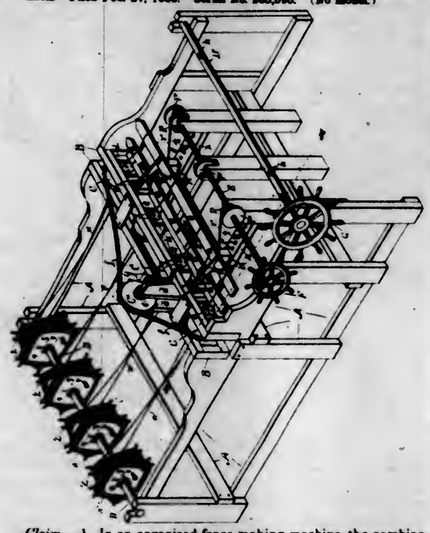
3. The combination, with a plow, of the frame G, attached to the beam and extending laterally therefrom, the said frame having the planting mechanism and the furrow-opener, the arm Z, having its rear end pivotally connected to the frame G and having its front end upturned, as at A', and secured to the plow-beam, the wheel C, journaled in arm Z and connected to the planting mechanism, the guard-arm P', attached to the front portion of arm Z and to the standard K' and extending rearwardly therefrom, the frame S^2, pivoted to the rear end of guard-arm, the wheel or roller journaled in the said frame, and the link or loop connecting the pivoted frame S^2 to one of the plow-handles, substantially as described.

4. In a planter, the frame G, having the parallel beams M and N, adapted to receive the plow-beam between them, and thereby attach the said frame to the said plow-beam, one of the said beams being adjustable in the frame G, so as to clamp the other beam throughout the length of the clamping-beam, substantially as described.

5. The combination of the hopper, the planting mechanism located at one end thereof, and the bottom board, Z', arranged longitudinally in the hopper and having its end adjacent to the planting mechanism pivoted, whereby the said board may be inclined and caused to feed the contents of the hopper to the planting mechanism, substantially as described.

6. The combination of the hopper having the reciprocating seed-slide N^1, the oscillating block S, arranged below the slide, and the fulcrumed arm W, having its lower end connected to the block S and its upper end engaging the slide, substantially as described.

7. The combination of the hopper having the reciprocating seed-slide N^1, provided with the opening P^3, the oscillating blocks S, arranged below the slide, and the fulcrumed arm W, having its upper end engaging the opening P^3 of the slide and its lower end slotted and engaging a pin projecting from the block S, substantially as described.



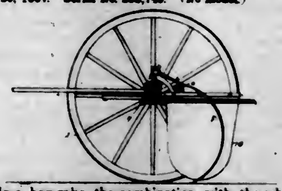
8. The combination, with the plow, of the frame G, projecting from one side of the beam and having the planting mechanism, the standard K', attached to the outer end of frame G and having the furrow-opener, the frame S^2, attached to the plow in rear of the frame G and having the roller T, and the guard-arm P', attached to the front of the plow-beam and to the standard K' and frame S^2, substantially as described.

9. In combination with the handles, the link U', depending from the handles, the wheel or roller T, the pivoted frame S^2, in which the roller is journaled and to which the link U' is attached, and the guard-arm P', connecting the frame S^2 to the frame of the machine, as set forth.

10. In combination with the hopper, the planting mechanism

located at one end thereof, the pivoted bottom board, Z, arranged longitudinally in the hopper, and the catch or projection for supporting the said board in the inclined position, as set forth.

388,400. **FENCE-MAKING MACHINE.** Lyman T. Curtis, Flint, Mich. Filed Feb. 27, 1888. Serial No. 265,380. (No model.)

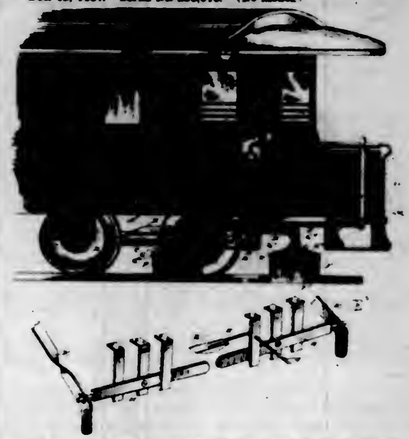


Claim.—1. In an organized fence-making machine, the combination of the main frame, the shaft journaled therein, said shaft having the series of reels journaled thereon, said reels having the U-shaped links pivoted thereto, and means for producing friction between said reels, the frame B, the series of twisting-heads attached thereto, and mechanism for driving said twisting-heads, as and for the purposes specified.

2. In a fence-weaving machine, the combination of the main frame, the frame B, having the series of twisting-heads, the mechanism for driving said twisting-heads, the carriage mounted on the main frame, the hooks A, made fast to said carriage, the engaging-arms n, adjustably pivoted at one end, the shaft and cords for advancing said carriage, and the cord and weight for returning said carriage, as and for the purposes specified.

3. In a fence-weaving machine, the reel having the U-shaped links pivoted thereon, as and for the purposes specified.

388,401. **HORSE HAY-RAKE.** Barney Dumaurier, Grafton, Dak. Filed Oct. 29, 1887. Serial No. 253,749. (No model.)



Claim.—In a hay-rake, the combination, with the wheels 2 and axle 4, of the tilting frame 6, pivoted upon said axle, the teeth 8, carried by said frame and moving therewith, and the end plates or guards, 10, secured to said frame 6, between the outer rake-teeth and the wheels and moving with said frame and teeth, substantially as described.

388,402. **BUTTON.** Ezra S. Dodge, Providence, R. I. Filed Aug. 20, 1887. Serial No. 248,221. (No model.)

Claim.—A cuff-fastener having a shoe, A, hollow post B, provided with a flaring base, *a*, and the perforated head C, the perforated disk *f*, the flaring perforated spring-plate D, provided with the perforation *d*, having the slits *e*, pin E, provided with the notch *e*, supplementary button G, and chain F, connecting the supplementary button to the head *g* of the pin, substantially as described.

388,403. **STREET-RAILWAY-TRACK CLEANER.** Charles R. Doty, Rock Falls, assignor to Edgar R. Andrews, Sterling, Ill. Filed Dec. 15, 1887. Serial No. 258,013. (No model.)

Claim.—1. In combination with the brush F, the holder G, provided with lugs G', and centrally-seated stem G^2, provided with the groove G^3, substantially as shown, and for the purpose described.

2. In combination with the axle C of a street-car, the arms E, pivotally seated at their inner ends on said axle, and the brush F, suitably seated on the depending end E^2 of said arm, substantially as shown, and for the purpose described.

3. In combination with the carrying-axle C of a street-car, the arms E, pivotally seated at their inner ends on said axle and provided with the slot E', the brush F, suitably attached to the outer ends of said arms, the lever H, suitably fulcrumed to the frame A, the rock-shaft J, provided with the arm K, adapted to engage the inner ends of the levers H, and means, substantially as shown, for operating and holding said shaft J, for the purpose described.

388,404. **SETTING MECHANISM FOR WATCHES.** August Fischer, Winchester, Ill. Filed Mar. 2, 1888. Serial No. 265,996. (No model.)

Claim.—1. In a watch such as described, the combination of the hands of the watch, an attachment for setting the hands independently, adapted to engage each separately when moved in opposite directions, and a bezel adapted to be rotated in both directions for moving the setting attachment, substantially as described.

2. In a watch such as described, the combination of the hands of the watch, two rings adapted to be moved in both directions and to move the hands in one direction only, and intermediate connections for causing the said rings to move in opposite directions, substantially as described.

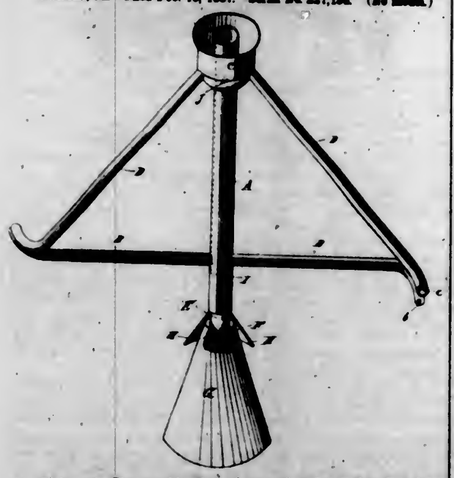
3. In a watch such as described, the combination of the hands of the watch, two rings provided with cogs upon the opposite edges and adapted to be moved in both directions and to move the hands in one direction only, and an interposed cog-wheel the cogs of which are geared with the cogs of the said rings to move them in opposite directions synchronously, substantially as described.

4. In a watch such as described, the combination of the hands of the watch, two crown ratchet-wheels provided with cogs upon the opposite edges and the teeth inclined in the same direction on both wheels and adapted to engage said hands only when moved in the direction of the inclination of the said spurs, and an interposed cog-wheel geared with said wheels to move them in opposite directions synchronously, substantially as described.

5. In a watch such as described, the combination of the hands of the watch, two rings provided with cogs upon the opposite edges and adapted to move in opposite directions, intermediate connections between the said hands and rings for causing the hands to be moved by the rings when moving in one direction only, an interposed cog-wheel geared with the said wheels to move them in opposite directions synchronously, and a bezel adapted to be rotated in both directions for moving the said rings, substantially as described.

6. In a watch such as described, the combination of the hands of the watch, a setting mechanism for setting the hands separately, a bezel adapted to be rotated in both directions for operating the setting mechanism, and a spring locking attachment for retaining the said dial in position, substantially as described.

7. In a watch such as described, the combination of the hands of the watch, a setting mechanism for setting the hands separately, a bezel adapted to be rotated in both directions for operating the setting mechanism and provided with a serrated edge, and a spring-actuated foot adapted to set in the said serrations and lock the said dial, substantially as described.

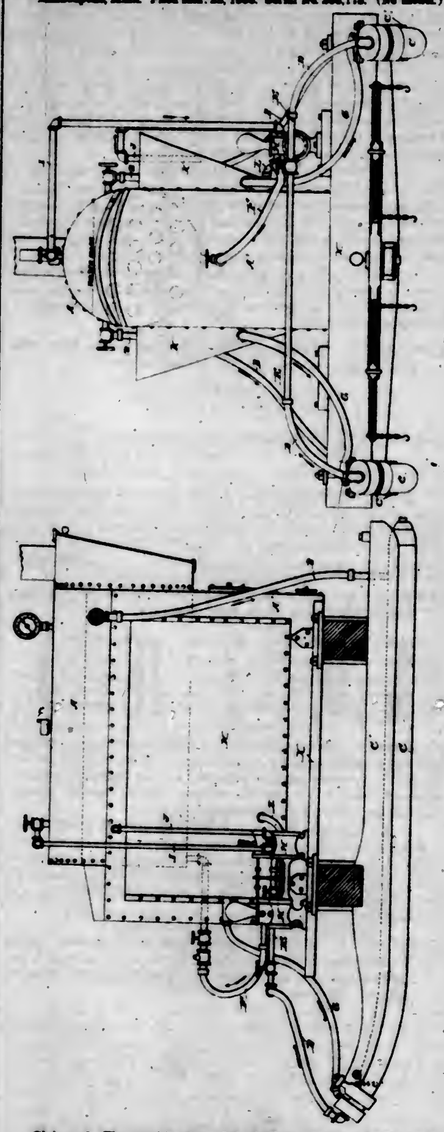


388,405. **BADGE-HOLDER.** Gerald B. Fraser, Peoria, Ill. Filed Apr. 4, 1888. Serial No. 269,632. (No model.)

Claim.—1. A badge-holder formed of a single plate of metal having tongues or points a^2 cut therefrom, the bases of said tongues or points being integral with the body A, and the outer ends of said points or tongues extending to approximately the edges of said body, said body being provided with a suitable attaching device, substantially as described.

2. A badge-holder formed of a single plate, A, of metal, having the folded edge *a*, and having the tongues or points a^2 formed integrally therewith near the outer edges, and provided with a suitable pin, B, substantially as described.

388,406. **SULPHURIC-ACID DISTRIBUTER.** Shuyler Fraser, Natrona, Pa. Filed Feb. 10, 1887. Serial No. 227,128. (No model.)



Claim.—1. The combination of a supply-tube, outlet-pipes from said supply-tube, and having a reduced opening, and overflow-pipes connected with the supply-tube and having a different-sized opening from the opening in said outlet-pipes, substantially as described.

2. The combination of a supply-tube having an overflow reservoir or basin, outlet-tubes connected with the supply-tube, and overflow-tubes connected with the reservoir, substantially as described.

3. The combination of a standard, G, a supply-pipe having a bearing in the standard G, acid-throwing arms in said supply-pipe, and a shield interposed between the arms and the step, substantially as described.

388,407. **DEVICE FOR MAKING SLED-ROADS.** Henry B. Frey, Minneapolis, Minn. Filed Mar. 22, 1888. Serial No. 268,173. (No model.)

Claim.—1. The combination of the hollow runners, a boiler, and the pipes connecting the runners at or near each end with the boiler, whereby there is maintained a circulation through the boiler and runners, substantially as described.

2. In a device for making sled-roads, the combination of the hollow runners, a boiler, the circulating-pipes between the boiler and the runners, and a pump for maintaining circulation, substantially as described.

3. In a device for making sled-roads, the combination of the hollow runners, and the circulating-pipes connecting the runners and the boiler, which they enter below the water-level, substantially as described.

4. In a device for making sled-roads, the combination, with a sled and a boiler mounted thereon, of a receptacle upon the outside of the boiler adapted to receive snow, which is melted therein, substantially as described.

5. In a device for making sled-roads, the combination, with a sled and a boiler mounted thereon having a fire-box, of the snow-receptacles converging toward their lower portions and supported upon the outside of the fire-box, substantially as described.

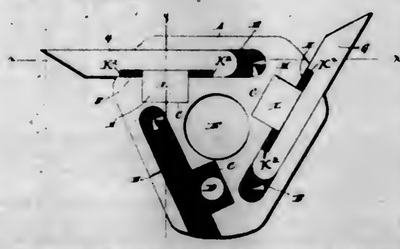
6. In a device for making sled-roads, the combination, with a sled having hollow runners and a boiler mounted thereon, of circulating-pipes between the boiler and runners, a pump to maintain the circulation in said pipes, a snow-receptacle in proximity to the boiler wherein the snow is melted, and a water-pipe, L, between the said receptacle and the pump, substantially as set forth.

7. In a device for making sled-roads, the combination, with a sled having hollow runners, and a boiler mounted thereon, of circulating-pipes between the boiler and the runners, a pump to maintain circulation in said pipes, a snow-receptacle, a steam-pipe, I, between the boiler and the pump, and an exhaust-pipe, J, delivering from the pump into the snow-receptacle, substantially as described.

8. In a device for making sled-roads, the herein-described hollow runner, consisting of the pipe C, bent at one end, in combination with the block or bar C', grooved on its under face to receive the pipe C, substantially as set forth.

388,408. VEHICLE. RICHARD F. GOODRICH, Jackson, Mich. Filed Apr. 21, 1888. Serial No. 271,499. (No model.)

Claim.—The combination of a rear axle bent between its ends so as to allow the body of the vehicle to swing below the centers of the rear wheels, a straight forward axle, and a body the floor of which is bent upward at the forward end to leave a space vertically over the forward axle, substantially as shown, and for the purpose described.

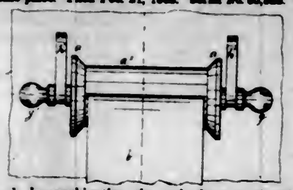


388,409. HINGE. JOHN M. GRAY, Fort Leavenworth, Kans. Filed Apr. 16, 1888. Serial No. 270,794. (No model.)

Claim.—1. The combination, in a hinge, of a fixed leaf, a sliding leaf, and a base-plate with a curved arm secured to the fixed leaf and adapted to pass through the sliding leaf and the base-plate when the parts are swung to, whereby the parts are locked together, substantially as and for the purpose described.

2. A hinge comprising a fixed leaf, a sliding leaf provided with a straight piece forming projections, a base-plate having retaining-strips which provide ways in which the projections of the sliding leaf slide, a spring secured to the base-plate and bearing against the straight piece of the sliding leaf, and a curved arm secured to the fixed leaf substantially as and for the purpose described.

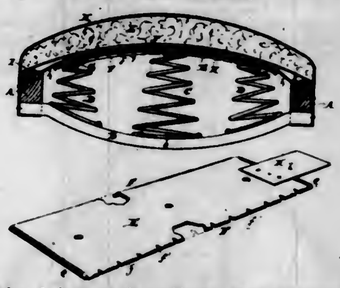
388,410. CUTTER-HEAD FOR GROOVING-MACHINES. JULIAN T. GRZYBOWSKI, Grand Rapids, Mich., assignor of one-half to R. R. Butterworth and James Lowe, same place. Filed Nov. 1, 1887. Serial No. 253,990. (No model.)



Claim.—1. The cutter-head having the grooves B, the cutters having their shanks fitted in the grooves, the clamping-bolts having their heads locking the shanks, and the limiting shoulders or stops K^2 on the shanks on each side of the bolt-heads, the distance between the shoulders or stops being greater than the size of the bolt-heads, so as to allow a limited longitudinal play of the shanks of the cutters, as set forth.

2. The combination of the cutter-head having the grooves B, the cutters having the shanks fitted in the said grooves and provided with the longitudinal recesses K, the stops or shoulders K^2 at the ends of the recesses, and the clamping-bolts having the heads bearing against the recessed portions of the sides of the cutters, the recesses being longer than the heads of the bolts, whereby the latter may be adjusted longitudinally, substantially as described.

3. The combination of the cutter-head having the grooves B, and the recesses C, communicating with the said grooves, the cutters having their shanks fitted in the grooves B and provided with the longitudinal recesses K, the sides of which are inclined, the stops or shoulders K^2 at the ends of the recesses, the clamping-bolts having their heads fitted in the grooves C and bearing against the sides of the recesses K, and the clamping-nuts screwed to the threaded ends of the bolts, substantially as described.



388,411. CALENDAR OR MEMORANDUM-ROLL. HENRY S. HACK, Taunton, Mass., assignor, by mesne assignments, to Emily F. Hack, same place. Filed Feb. 21, 1883. Serial No. 85,888. (No model.)

Claim.—1. In combination, the end pieces, *a a'*, each having a hole through it, the roll *b*, with its hollow spindle *f*, and the two finger-pieces *g g'*, each extending through one of the end pieces and into but only partly through the hollow spindle *f*, as and for the purpose specified.

2. In combination, the backing A, the metal devices A', and pieces *a a'*, roll *b*, with its hollow spindle *f*, and the two finger-pieces *g g'*, extending each through one of the metal devices A' and one of the end pieces, *a a'*, and into but only partially through the hollow spindle *f*, as and for the purpose specified.

388,412. CAR-SEAT. HENRY S. HALE, Philadelphia, Pa. Filed Jan. 7, 1887. Serial No. 223,662. (No model.)

Claim.—1. In a seat, the combination of the box-frame, a series of bow-shaped cross-bars secured to the under side of said frame and having the middle curvature downward, a series of springs supported on each cross-bar, flexible strips secured to the upper parts of said springs, flexible connections between said strips and seat-frame, by which the said strips are caused to curve upward in the middle, and a seat-cushion or upholstering supported above said strips and with its curvature in the opposite direction to that of the cross-bars.

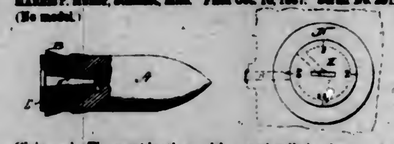
2. In a seat, the combination of the box-frame, a series of bow-shaped cross-bars secured to the under side of said frame and having the middle curvature downward, a series of springs supported on each cross-bar, wide flexible strips of sheet metal secured to the upper parts of said springs, flexible textile connections between said strips and seat-frame, by which the said strips are caused to curve upward in the middle, and a seat-cushion or upholstering supported above said strips and with its curvature in the opposite direction to that of the cross-bars.

3. In a seat, the combination of the box-frame, a series of bow-shaped cross-bars secured to the under side of said frame and having the middle curvature downward, a series of springs supported on each cross-bar, flexible strips of sheet metal made wide and having their lateral edges curved downward secured to the upper parts of said springs, flexible textile coverings secured to and connecting said strips,

and seat-frame by which the said strips are caused to curve upward in the middle, and a seat-cushion or upholstering supported above said strips and with its curvature in the opposite direction to that of the cross-bars.

4. In a seat, the combination of the main or box frame, cross-bars secured to the bottom of said frame, springs supported on said cross-bars, wide flexible sheet-metal supporting-strips secured to the tops of said springs, and narrow textile bands extending over said metallic strips and secured on its ends to the box-frame, and upholstery directly supported upon said wide sheet-metal strips.

5. In a seat, the combination of the main or box frame, cross-bars secured to the bottom of said frame, springs supported on said cross-bars, wide flexible sheet-metal supporting-strips secured to the tops of said springs, and narrow textile bands extending over said metallic strips and secured on its ends to the box-frame, and rivets uniting said fabric to the sheet-metal strips, and upholstery directly supported upon said wide sheet-metal strips.



6. In a seat, the combination of the main or box frame, cross-bars secured to the bottom of said frame, springs supported on said cross-bars, wide flexible sheet-metal supporting-strips having their lateral edges curved downward secured to the tops of said springs, and narrow textile bands extending over said metallic strips and secured on its ends to the box-frame; and upholstery directly upon said wide sheet-metal strips.

7. In a seat, the combination of the main or box frame, cross-bars secured to the bottom of said frame, springs supported on said cross-bars, wide flexible sheet-metal supporting-strips having their lateral edges curved downward and notched secured to the tops of said springs, and narrow textile bands extending over said metallic strips and secured on the ends to the box-frame.

8. A flexible supporting-strip for a car-seat cushion, consisting of a flexible sheet-metal strip having its edges curved downward and notched to make it extremely flexible and prevent injury to the textile covering when in use, substantially as and for the purpose specified.

9. In a seat, the frame A, in combination with downward-curved cross-bars secured to it at the bottom, upwardly-curved cushion-supporting strips and a series of springs interposed between them, supported upon said bars and of different sizes, the largest or highest being in the middle, whereby the vertical capacity of the seat gradually increases from the edges to the center.

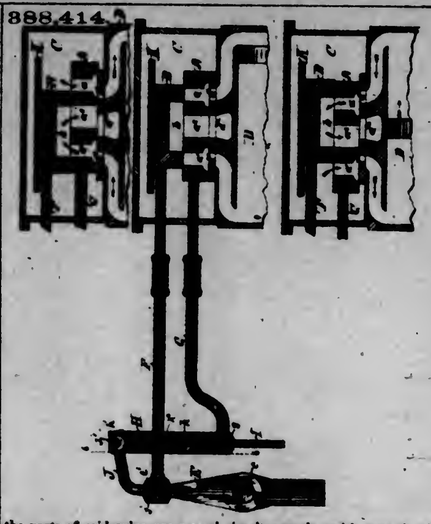
388,413. PROJECTILE. JOSEPH R. HAWLEY, Hartford, Conn., and HARRIS P. HUNT, Summit, Minn. Filed Oct. 10, 1887. Serial No. 251,986. (No model.)

Claim.—1. The combination, with a projectile having a movable sabot, of a cap in front of the sabot and a time-fuse having a revoluble plug between the cap and bursting charge, said plug having a time-charge in a groove in front of the cap, substantially as described.

2. The combination, with the projectile, of the movable sabot consisting of a central core surrounded by rings, a pin connecting the core and body of the projectile, a cap in front of the core-piece, and a time-fuse having a revoluble plug provided with a burning charge connecting the cap and bursting charge of the shell, substantially as described.

3. The combination, with a projectile, ring-sabot, and core-piece on which the rings are mounted, of a pin connecting the core and sabot in such manner that the pin is sheared off in firing the gun, substantially as described.

4. The combination, with a projectile, of a sabot consisting, essentially, of rings or washers, the rings gradually increasing in diameter from front to rear, substantially as shown.



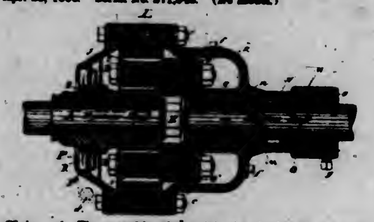
5. The combination, with a projectile, of a series of leather washers gradually increasing in diameter toward the rear and surrounding a core-piece, said core-piece being attached to the projectile, substantially as described, so as to compel the rotation of the projectile.

388,414. STEAM-ENGINE VALVE. JOHN HEATH, Janesville, Wis. Filed Feb. 14, 1888. Serial No. 263,964. (No model.)

Claim.—1. The combination of the two-part valve, the lower valve having two steam-inlet ports and an exhaust-port, and the upper valve having an exhaust port or passage therein, in combination with the cylinder having two entrance-ports and an exhaust-port and operating-connections to move said valves simultaneously and in opposite directions with respect to each other in admitting and exhausting steam, substantially as described.

2. The combination of the two-part valve, the single rocker-arm, and the intermediate connections, substantially as described, whereby

388,414



the parts of said valve are moved simultaneously and in opposite directions with respect to each other.

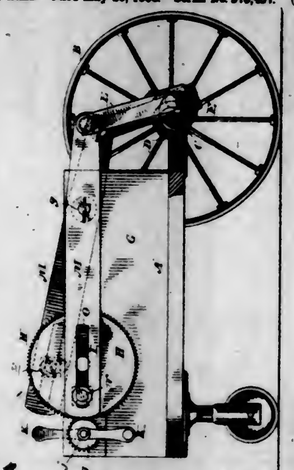
3. The combination, in a two-part valve-gear, of the main rocker-arm, a second rocking arm or beam connected to and actuated by said first-mentioned rocker-arm, and the valve-rods, whereby the movement of the main rocker-arm, which moves one of said valve-rods, also moves the other valve-rod in the opposite direction, substantially as described.

4. In a two-part valve-gear, the combination of two rocker-arms, two valve-rods pivotally connected one with each of said rocking arms, and a link-connection between said rocking arms, substantially as described.

5. The combination, with the valve and steam-chest in which it is mounted, of a steam-plate rigidly supported above said valve, the side supporting-plates of said steam-plate, and the fastening-bolts securing said steam-plate and side plates together around the valve and passing through said steam-plate outside said side supporting-plates and into the cylinder-face, substantially as described.

388,415. DEVICE FOR GEARING ENGINE-SHAFTS DIRECTLY TO THE DRIVEN MACHINE. EDWARD H. HEWINS, Boston, Mass. Filed Apr. 28, 1888. Serial No. 271,840. (No model.)

Claim.—1. The combination, with the shafts of a motor and a dynamo-electric machine, of a set of gears connecting the same and consisting of a gear on the dynamo-shaft, a stationary internal gear surrounding it, and intermediate loosely-mounted pinions carried by the engine-shaft, as herein set forth, whereby the two shafts are maintained in alignment and the dynamo driven at a higher speed than the engine.

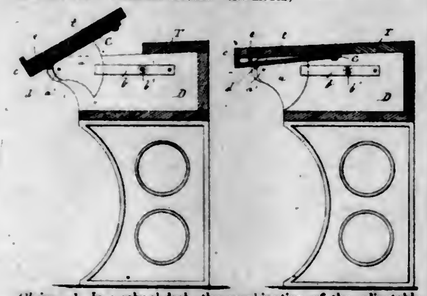


2. The combination, with a dynamo-shaft having a gear, C, an engine-shaft carrying the loosely-mounted pinions I I, engaging therewith, and a stationary surrounding casing or box forming an oil-chamber and provided with an internal gear, L, with which the pinions engage, as set forth.

3. The combination, with the shaft of a dynamo-machine, and the hub B, secured thereto and provided with a gear, C, of an engine-shaft in alignment therewith, a hub, G, secured thereon, pinion-gears I, carried by the hub and engaging with the gear C, and an inclosing stationary box or casing forming an oil-chamber and provided with the internal gear, L, with which the pinions engage, as set forth.

4. The combination, with the driving-shaft of an engine and the

shaft of a dynamo-electric machine in alignment therewith, of a system of multiplying gears mounted concentrically with the said shafts and connected to them so as to drive the dynamo-shaft at a higher speed than the engine-shaft, as herein set forth.

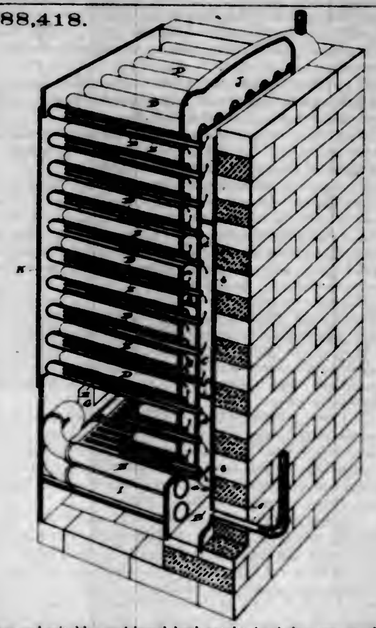


388,416. MECHANICAL MOTOR. Pleasant Hoskett, Stafford County, Kans. Filed May 29, 1888. Serial No. 275,437. (No model.)

Claim.—1. The combination of the driving-wheels, the driving-levers, the pitman-rods hinged to the shorter ends of the driving-levers, and the wrist-pins secured to the driving-wheels and adapted to slide in slots in the ends of the longer arms of the driving-levers, substantially as set forth.

2. The combination of the vehicle-body, the wheels, the axle rigidly secured to the wheels, the cranks on the axle, the standard on the vehicle-body, the driving-wheels mounted thereon, the driving-levers, the pitman-connections between the driving-levers and the cranks on the axle, and the wrist-pins extending through slots in the longer arms of the driving-levers for connecting the levers to the driving-wheels, substantially as set forth.

388,417. SCHOOL-DESK. Moses W. Kidder, Lincoln, Mass. Filed Feb. 14, 1888. Serial No. 264,010. (No model.)



Claim.—1. In a school-desk, the combination of the adjustable top, the sector-shaped hinge-plates secured to the under side of said top and turning upon a pin at the center, the friction-clamp consisting of a bar secured at one end to the side of the desk and bearing at its other end upon the hinge-plates, and the adjusting-screw passing through the clamp-bar and engaging the side of the desk, as and for the purpose set forth.

2. In a school-desk, the combination, with a hinged desk-top, of one or more levers secured to the under side of the desk-top, a ledge normally supported by said levers in position flush with the desk-top, and a stud on the desk eccentric to the pivot and adapted to engage the levers to throw the ledge upward when the desk-top is raised, substantially as set forth.

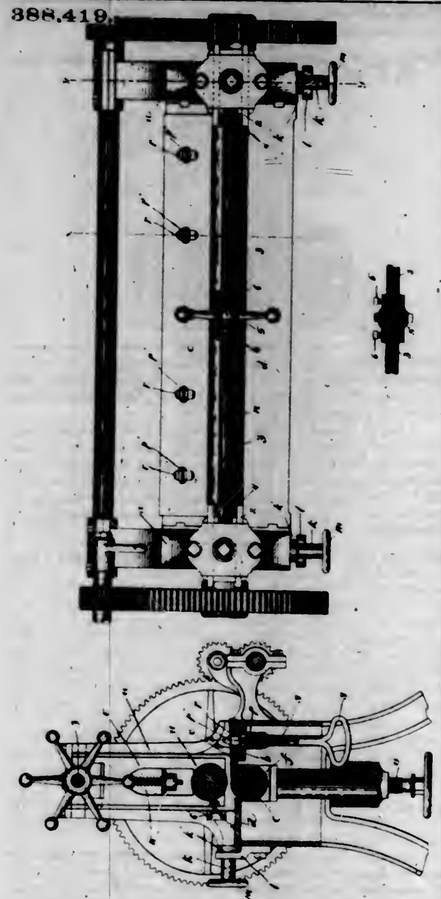
388,418. SECTIONAL WATER-HEATER. William Kirkwood, Guelph, Ontario, Canada. Filed Dec. 15, 1887. Serial No. 257,257. (No model.)

Claim.—1. Two vertical chambers arranged parallel with each other and suitably partitioned, horizontal tubes being connected to the walls of and arranged in groups, as described, to connect with the interior of one chamber, which is bridged by horizontal tubes of a smaller diameter connected to the walls of and communicating with the interior of the other chamber, the said tubes extending into the tubes connected to the wall of the former chamber, so that fluid entering the latter will flow through the larger tubes and find its way through the smaller tubes into the other chamber in one group and vice versa in the next group, substantially as and for the purpose specified.

388,418.

2. Two vertical chambers arranged parallel with each other and suitably partitioned, horizontal tubes being connected to the walls of and arranged in groups, as described, to connect with the interior of one chamber, which is bridged by horizontal tubes of a smaller diameter connected to the walls of and communicating with the interior of the other chamber, the said tubes extending into the tubes connected to the wall of the former chamber, so that fluid entering the latter will flow through the larger tubes and find its way through the smaller tubes into the other chamber in one group and vice versa in the next group, in combination with the dome J, into which the said chambers communicate, substantially as and for the purposes specified.

3. The tubes D, closed at one end and connected at their opposite open end to the wall *a*, and containing smaller tubes, E, open at both ends, but connected to the walls *d* at one end, so that the chambers B C will be connected through the tubes specified, in combination with horizontal partitions formed across the chambers B C, and alternating, as shown, and the pipes H I, arranged beneath the lower partition around the furnace, substantially as and for the purpose specified.



388,419. LEATHER-SPLITTING MACHINE. David Knox, Lynn, Mass. Filed Jan. 7, 1888. Serial No. 260,042. (No model.)

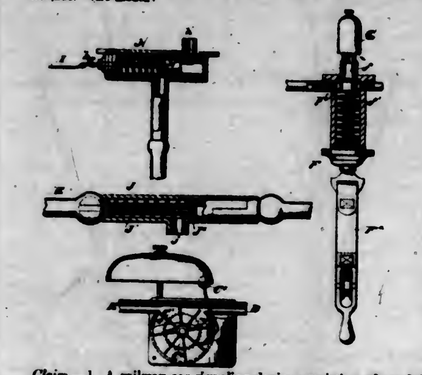
Claim.—1. In a leather-splitting machine, the combination of the supporting-frame, the splitting-knife thereon, the adjustable upper roll, *a*, the lower roll mounted in spring-supported boxes, and the independently adjustable wedge-bars arranged above the boxes and supporting the same against the upward pressure of their springs, whereby said boxes may be adjusted independently.

2. The combination, with the knife and the lower roll and its boxes, of the springs *g g*, whereby said boxes are pressed upwardly, the wedge-bars *h h*, located above said boxes in slots extending across the end pieces of the frame and terminating in threaded bolts, and the adjusting-nuts *k k*, engaged with said bolts and with the frame of the machine, said wedge-bars supporting the boxes against the upward pressure of their springs and enabling the boxes to be independently adjusted, as set forth.

3. The combination, with the knife and the lower roll and its boxes, of the springs *g g*, whereby said boxes are pressed upwardly,

388,419.

the wedge-bars *h h*, located above said boxes in slots extending across the end pieces of the frame and terminating in threaded bolts, the adjusting-nuts *k k*, engaged with said bolts and with the frame of the machine, said wedge-bars supporting the boxes against the upward pressure of their springs and enabling the boxes to be independently adjusted, and the screws *o*, whereby the tension of the springs *g* may be adjusted to correspond with adjustments of the wedge-bars, as set forth.

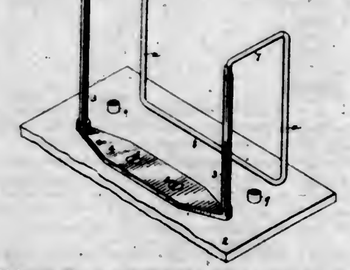


4. The combination of the knife-bed having slots or apertures b^3, the knife having slots *r*, made longer than the slots b^3, the bolts *p*, having oblong heads formed to enter said slots *r*, but of greater length than the slots b^3, whereby, when said heads are in the slots *r*, they will be supported by the bed, and the nuts *s*, engaged with said bolts and adapted to bear on the under side of the bed, as set forth.

5. The combination of the knife-bed, the knife having oblong slots, the bolts having oblong heads adapted to fit said slots, and the square portions which prevent the bolt from turning in the slots, and the nuts adapted to engage said bolts and having handles, all arranged and operating substantially as described.

6. In a leather-splitting machine, the combination, with the knife, the lower roll, and the adjustable upper roll, of a pointer or index movable with the upper roll, and a fixed scale or graduated plate on the frame of the machine, as set forth.

7. In a leather-splitting machine, the combination, with the knife, the upper roll, and the wedges whereby the upper roll is adjusted, of the two-part screw-threaded rod engaged, as described, with said wedges, and the connecting device or hub to which the parts or sections of the screw-threaded rod are detachably secured, whereby the said wedges may be independently adjusted, as set forth.



388,420. RAILWAY-CAR SIGNAL. Charles P. Lauren and Richard V. R. Gill, Detroit, Mich. Filed Mar. 15, 1888. Serial No. 267,219. (No model.)

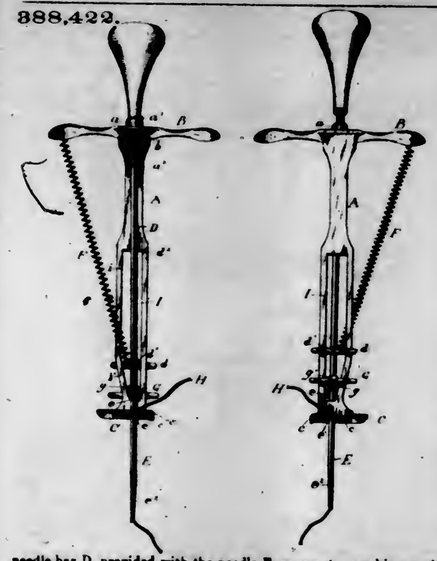
Claim.—1. A railway-car signaling device consisting of conduits D E, connecting the brake mechanism or other source of air-pressure with the cars, a signaling device, C, located in the locomotive at the juncture of said conduits, said signaling device consisting of a wheel, C', located in chamber *c*, ratchet-wheel C^2, and escapement C^3, connected with the bell-clapper C^4, and points in the conduit E for permitting the escape of the compressed air, thereby creating a draft and operating the signal, substantially as described.

2. A railway-car signaling device consisting of conduits D E, connecting a source of air-supply with the cars, and a signaling device, C, located in the locomotive at the juncture of said conduits and adapted to be operated by the passage of air along said conduits, and an escape, F, in the conduit E, consisting of an orifice having a whistle, G, mounted thereon, a valve, F', in the line of the conduit, having an annular passage around it for the circulation of air through said conduit, a spring, *f'*, normally closing said valve, and a strap, F^2, for opening said valve, substantially as described.

388,421. LETTER FILE AND BINDER. Benjamin Lawrence, New York, N. Y., assignor to Louisa Lawrence, same place. Filed June 5, 1888. Serial No. 276,096. (No model.)

Claim.—1. The combination of tubular upright impaling-wires and a transfer-frame composed of downwardly-projecting legs, rearwardly-extending portions, and a cross-connection, substantially as set forth.

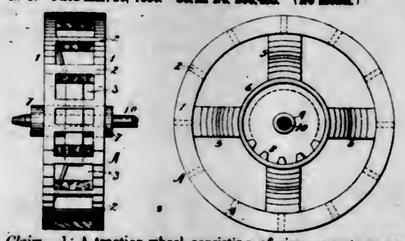
2. The combination of a board or tablet having tubular upright impaling-wires and holes or sockets 9 9 in rear thereof, with a transfer-frame composed, essentially, of the parts 6 6, 7 7, and 8, substantially as set forth.



3. A transfer-frame for use in connection with receiving-wires, as 3 3, composed of the parts 6 6, 7 7, and 8, substantially as set forth.

4. A transfer-frame for use in connection with receiving-wires, as 3 3, composed of the parts 6 6, 7 7, *a a*, and 8, substantially as set forth.

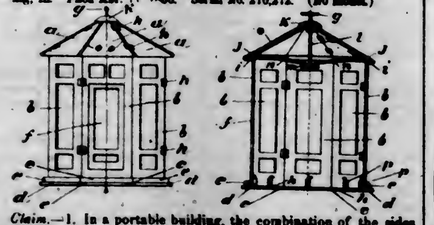
388,422. FABRIC-TURFING IMPLEMENT. Dio Lewis, Prescott, Ark. Filed June 1, 1888. Serial No. 275,704. (No model.)



Claim.—The combination of the plate A, provided with the fixed sleeve a^2, and slot 1, having the incline *i'*, foot C, provided with the slot *c*, cross-head bar B, provided with the elongated perforation *b*,

388,422.

needle-bar D, provided with the needle E, gage-nut *a*, working on the threaded part of said needle-bar, bolt *d''*, secured in said needle-bar, acting as the lower stop, bar G and sleeve *g*, regulating the length of the stitch, spring F, its lower end attached to said needle-bar near its lower end and its upper end to the extreme end of said cross-head bar, substantially as shown and described, and for the purposes set forth.



388,423. TRACTION-WHEEL. George R. Lewis, Seneca Falls, N. Y. Filed Mar. 26, 1888. Serial No. 268,488. (No model.)

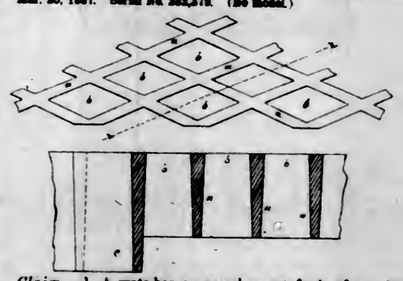
Claim.—1. A traction-wheel consisting of rims, cross-bars connecting the rims, and spokes carrying upon their inner ends a ratchet-case and hub all cast in one piece, substantially as described.

2. A traction-wheel consisting of a hub, a ratchet-case surrounding and integral with the hub, spokes extending outward from the ratchet-case and integral therewith, and the outer periphery of the wheel integral with the outer ends of the spokes and provided with openings through the periphery, substantially as described.

388,424. PORTABLE HOUSE. Andrew Lindblad, Grand Crossing, Ill. Filed Apr. 11, 1888. Serial No. 270,372. (No model.)

Claim.—1. In a portable building, the combination of the sides *b* and roof-division *a*, provided with cleats *i* and *j* on their lower sides, in combination with the collar *k*, rod *l*, disk *m*, and rods *n*, substantially as and for the purpose specified.

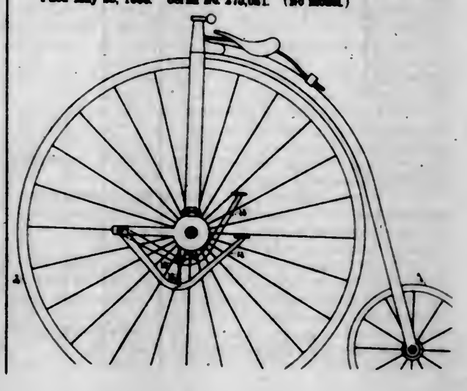
2. In a portable house, the floor made of divisions *c d*, the sides secured to the floor by bolts *p*, and roof made of divisions *a*, in combination with the connecting-rods *n*, disk *m*, collar *o*, and tightening-rod *l*, substantially as and for the purposes specified.



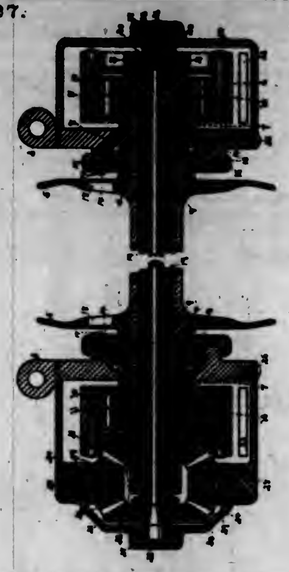
388,425. BASKET. Elizabeth H. Little, Boston, Mass. Filed Apr. 21, 1888. Serial No. 271,412. (Model.)

Claim.—1. As an improved article of manufacture, the herein-described basket, made of rope or cord and consisting of the coil A, forming the bottom, and the Turk's-head knot B, forming the side, said bottom and side consisting of a single rope or cord, substantially as and for the purpose set forth.

2. As an improved article of manufacture, the herein-described basket, made of rope or cord and consisting of the coil A, forming the bottom, the Turk's-head knot B, forming the side, laid handle C, and the rosette D, produced by forming the ends C' of the handle and the end A''' of the rope or cord which forms the bottom and sides into a wall and crown knot, said ends being frayed out or unraveled at D', substantially as and for the purpose described.



388,426. GRATE-BAR. James Marsh, New York, N. Y. Filed Mar. 25, 1887. Serial No. 232,579. (No model.)



Claim.—1. A grate-bar composed, as set forth, of a series of shallow diagonal ribs, forming diamond-shaped air-spaces, and a pair of extra deep zigzag stiffening-ribs formed by the downward extension of the outside zigzag portions of the shallow diagonal ribs.

2. A grate-bar composed, as set forth, of the diagonal ribs *a*, forming diamond-shaped air-spaces *b b*, and a pair of extra deep stiffening-ribs, *c c*, formed by the downward extension of the outside zigzag portions of the shallow diagonal ribs extending only along the longitudinal sides of said grate-bars.

388,427. VELOCIPEDE. John M. Marlin, New Haven, Conn. Filed May 25, 1888. Serial No. 275,021. (No model.)

388,427.

Claim.—1. The combination of the wheel having hub projections 4 4 extending horizontally outward beyond its flanges 5 5, the steering-fork pivotally attached to the disks 3 3 at its lower end on each side of the wheel, the disks 3 3, supported upon the wheel-hub extensions by running-bearings, and the clutch-drums 11 11, supported on said wheel-hub extensions by running-bearings outside of the fork-bearings 3 3, and having clutches adapted to alternately connect them to and release them from the wheel-hub, substantially as described.

2. The combination of the wheel having hub projections 4 4 extending horizontally outward beyond its flanges 5 5, the steering-fork pivotally attached to its bearing-disks 3 3 at its lower ends, the disks 3 3, supported upon the wheel-hub projections by running-bearings, the clutch-drums 11 11, supported by running-bearings outside of the fork-bearings 3 3, and having clutches adapted to alternately connect them to and release them from the wheel-hub, and the central tie-rod or shaft, 26, connecting the opposite bearing-disks 3 3 together by frame-supports extending from its ends around and outside of the clutch-drums, substantially as described.

3. The combination of the wheel 2, having lateral hub-extensions 4 4, the fork-bearings 3 3, supported upon said hub-extensions, the clutch-drums 11 11, provided with clutches arranged to alternately connect and disconnect them from said hub-extensions as they reciprocally rotate, the shaft 19, connected directly to one clutch-drum and extending thence through and beyond the opposite end of the wheel-hub, and the intermediate gears, 21 30 32, connecting said shaft to the other clutch-drum, substantially as described.

4. The combination of the fork-bearings 3 3, taking a running-bearing upon wheel-hub extensions 4 4, the clutch-drums 11 11, provided with clutches arranged to alternately connect and disconnect them from the hub-extensions, the tubular shaft 19, extending beyond the ends of the wheel-hub and connected to one drum 11 directly at one end, and to the other drum 11 by intermediate gears, 21 30 32, at the other end, and the tie-rod 26, extending through the center of tubular shaft 19, and sustained at the ends by frame-supports extending from bearings 3 3 around outside of said clutch-drums and gears, substantially as described.

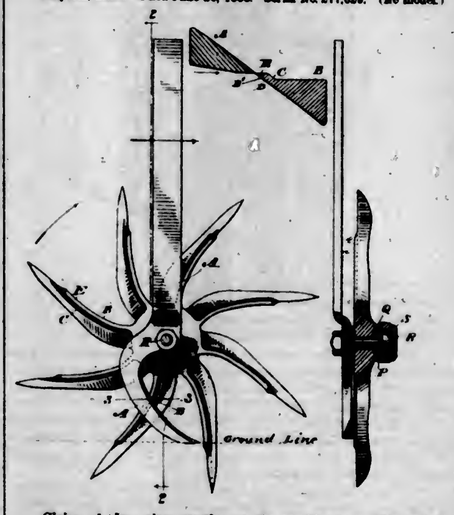
5. The combination of the tubular wheel-hub, the fork-bearings 3 3, the clutch-drums 11 11, their connecting tubular shaft 19, extending through the wheel-hub, and the central tie-rod, 26, extending through the tubular shaft, provided with adjustable cone-bearings 22 22 for shaft 19, and sustained by frame-supports upon the fork-bearings, substantially as described.

6. The combination of the tubular wheel-hub, the tubular revolving shaft 19, extending through the same, and the central tie-rod sustained at its ends by frame-supports and provided with cone-bearings 22 22 for shaft 19, and itself made adjustable in its frame-supports by the nuts 27 27, substantially as described.

7. The combination of the disk 3, the gage-ring 15, the collar 16, secured by screws to disk 3, and the separable grooved sleeve 7, surrounding the wheel-hub extension and clamped thereto and forming the ball-bearing, substantially as described.

8. The combination of the wheel-bearings 3 3, attached to the lower end of the steering-fork and formed in disk shape, the cup-shaped frame-supports 24 24, having their open ends fitting around said disks and attached thereto, and the central tie-rod, 26, supported in said cup-shaped pieces and passing through the wheel-hub, substantially as described.

9. The combination, with the frame-support 24, of the stud 28, carrying pinion 30, and also the end of tie-rod 26, which passes through the wheel-hub, substantially as described.



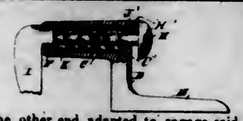
10. In combination with the fork-bearing 3, the cup-shaped frame-support 24, attached thereto and passing around and inclosing clutch-drum 11 and supporting one end of tie-rod 26, whereby the same becomes both part of the supporting-frame and an inclosing dust cap or guard, substantially as described.

11. The combination, in the inclosing cup-shaped frame-piece 24, of the bevel-gear 21, attached to shaft 19, centrally located in said cup, and the pinions 30 30, mounted upon studs 28, one or both of which studs are arranged to be inserted radially through the outer wall of said cup from the outside, whereby the said pinions are enabled to be mounted on said studs after gear 21 is introduced into place in said cup-shaped support, substantially as described.

12. The combination of the wheel-hub having the spoke-flange 5 around it and supported by a shoulder of the tube upon its inside face, and also having the extension 4, the ball-bearing sleeve 7, taking a bearing against said spoke-flange, and the collar 6, screwed onto said extension and bearing against and clamping sleeve 7 against flange 5, substantially as described.

13. In a velocipede having the large wheel forward of the small one, and a seat for the rider over the same, the combination of the wheel-hub, clutch-drums arranged to simultaneously lock themselves to the hub when the latter turns backward, and the shaft 19, and reversing-gears connecting said drums positively together and preventing them from simultaneously turning backward, substantially as described.

388,428. ATTACHMENT FOR PLOWS. Charles W. McCormick, Emporia, Kans. Filed June 30, 1888. Serial No. 277,699. (No model.)



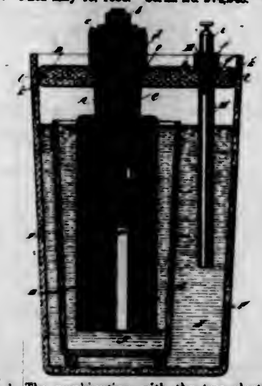
Claim.—1. In a plow attachment, the combination, with a colter having a shear-blade, of a walking wheel provided with earth-penetrating points arranged on lines forward of the axis of the wheel, so as to penetrate the earth substantially in a direct line, as set forth.

2. A walking wheel for a plow attachment, having its arms provided with a ledge or shear part, B, having parallel sides, substantially as set forth.

388,429. TRACE-FASTENER. Charles H. McDonald, Springfield, Ohio, assignor of one-half to William A. Hance, same place. Filed Apr. 28, 1888. Serial No. 271,703. (No model.)

Claim.—1. In a trace-fastener, the combination, with a barre having a standard and a foot-piece open at one end and provided with a hole and a notch at the other end, the hole being smaller than the interior of the barrel, of a bolt slidingly and rotatably fitted within the barrel, having a head at the one end of the barrel which slides therein

388,429.



and an arm at the other end adapted to engage said notch, and a spiral spring within the barrel and around the bolt and arranged to force the bolt longitudinally.

2. In a trace-fastener, the combination, with a barrel having one end thereof notched and provided with an interior shoulder, and the other end open, of a bolt slidingly and rotatably mounted in said barrel and having an arm at one end and a shoulder near said end, and a head at the other end which engages said notch, and a spring which forces the bolt longitudinally by pressing against the shoulder of the bolt and the shoulder in the barrel.

3. In a trace-fastener, the combination, with a barrel open at one end and provided at the other end with a hole and a notch, the hole being smaller than the interior of the barrel, of a bolt slidingly and rotatably mounted in said barrel and provided at one end with an arm adapted to engage said notch and at the other end with a head having a projection, whereby the bolt may be moved longitudinally and rotated by manipulating the head and its projection, and a spiral spring within the barrel and around the bolt and arranged to force the bolt longitudinally.

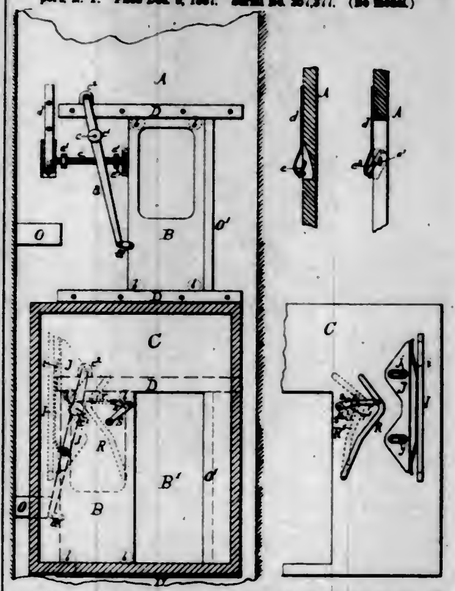
4. In a trace-fastener, the combination, with a barrel having a standard and a foot-piece open at one end and provided with a hole and a notch at the other end, the hole being smaller than the interior of the barrel, of a bolt bent at one end to form an arch and provided at the other with a head which occupies the bent end of said barrel, and a spiral spring arranged within the barrel and around the bolt and adapted to urge the bolt longitudinally.

388,430. GALVANIC BATTERY. Abraham V. Middleton, New York, N. Y. Filed May 18, 1888. Serial No. 274,242. (No model.)

Claim.—1. The combination, with the two electrodes, of two electrolytes for said electrodes, composed, respectively, of sulphate of mercury in dilute sulphuric acid and nitrate of mercury in dilute nitric acid, substantially as described.

2. The combination, with the two electrodes separated by a porous wall, of two electrolytes for said electrodes, composed, respectively, of sulphate of mercury in dilute sulphuric acid and nitrate of mercury in dilute nitric acid, substantially as described.

3. The combination, with a carbon electrode and a zinc electrode, of two electrolytes for said electrodes, composed, respectively, of sulphate of mercury in dilute sulphuric acid and nitrate of mercury in dilute nitric acid, substantially as described.



4. The combination, with the electrode B, having a flaring recess in its upper end, of the tapering conducting-plug A, entering said recess and secured therein, substantially as described.

5. The combination, with the electrode B, having a flaring recess in its upper end, of the tapering conducting-plug A, entering said recess, and the vertical rod C, passing through and securing the two together, substantially as described.

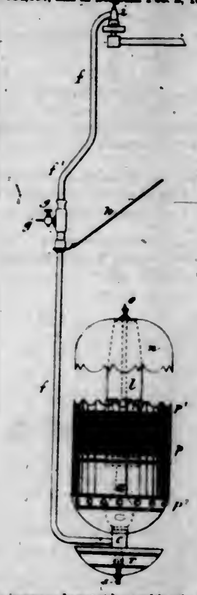
6. The combination, with the electrode B, having a flaring recess in its upper end, of the conducting-plug A, entering said recess, the disk *c*, located at the upper end of the plug A, and the rod C, passing through and securing the three together, substantially as described.

7. The combination, with the electrode E, of the cap *f*, of insulating material, seated in a recess formed in the upper side of the cover D and covering the upper end of the electrode, and the rod H, passing through the cap and secured to the electrode, substantially as described.

388,431. AUTOMATIC ELEVATOR-GATE. Aaron Miller, Brockport, N. Y. Filed Dec. 9, 1887. Serial No. 257,377. (No model.)

Claim.—1. In combination, the door, the cab, two separate and distinct cams located thereon, a lever articulating upon a fixed pin in or attached to the side of the elevator-casing and arranged to be actuated by such cams and to operate the door, such cams so formed and positioned on such cab and in relation to such lever that one of them shall serve only to open the doors and the other to close the doors, and means for causing either one of such cams to assume an operative position or not, as desired, and that, too, from the inside of the cab and without disturbing the other cam.

2. In combination, the door, the cab, two separate and distinct cams located thereon, a lever articulating upon a fixed pin in or attached to the side of the elevator-casing and arranged to be actuated by such cams and to operate the door, one of such cams consisting in a yielding or spring cam so formed and positioned on such cab and also in relation to the lever engaged thereby that such door shall be closed only thereby as the cab leaves the floor on which such door is located, such cam yielding so as to cushion the force with which such door is closed, the other one of such cams consisting in a pivotal cam located on the outside of the cab, and means for swinging or operating such pivotal cam from the inside of the car or cab, so that such pivotal cam may be caused to engage such lever or not, as may be desired, and such pivotal cam so formed and arranged, as shown and described, on such cab, and also in relation to such lever, that such door may be opened only by such cam or not, as may be desired.



3. In combination, the door, the cab, a yielding or spring cam, and a lever, such cam located on such cab and arranged to operate such lever and to yield or give somewhat under the pressure produced by such lever thereon, such lever articulating upon a fixed point in or attached to the side of the elevator-casing, such lever arranged to operate such door and to receive at its fulcrum the vertical thrust of such cam.

4. In combination, the door, the cab, a pivotal cam, and a lever, such cam located on such cab and arranged to operate such lever, such lever articulating upon a fixed stud in or attached to the side of the elevator-casing, such lever arranged to operate such door and to receive at its fulcrum the vertical thrust of such cam, and means for swinging or operating such pivotal cam from the inside of the car or cab, so that such pivotal cam may be caused to engage such lever or not, as may be desired.

5. In combination, the door, the cab, a yielding or spring cam, and a lever, such cam located on such cab and arranged to operate such lever and to yield or give somewhat under the pressure produced by such lever thereon, such lever articulating upon a fixed stud in or attached to the side of the elevator-casing, such lever arranged to operate such door and to receive at its fulcrum the vertical thrust of such cam, such yielding or spring cam provided with bearing-surfaces extending over the entire course traversed by the stud on such lever engaged thereby, so that such lever shall be engaged by such cam in any position that such door may occupy, whereby the level of the floor onto which such door opens can neither be approached nor left without closing such door.

6. In combination, the door, the cab, a cam thereon, and a spring-actuated swinging latch passing by and bearing against the edge of such door in locking the same.

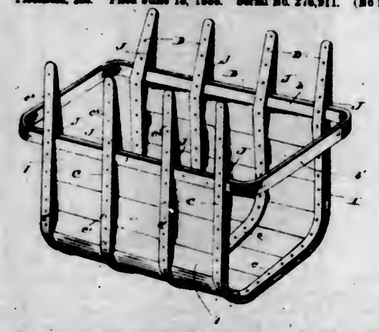
388,432. PORTABLE COMBINATION GAS HEATING, COOKING, AND VAPORIZING APPARATUS. Herbert P. Miller, London, County of Middlesex, England. Filed Jan. 17, 1888. Serial No. 261,012. (No model.) Patented in England Aug. 8, 1888, No. 9,264; in France June 8, 1887, No. 184,697, and in Belgium Feb. 2, 1888, No. 80,492.

Claim.—An improved portable combination gas heating, cooking, and vaporizing apparatus, consisting of atmospheric burner *a*, with spindle *k*, threaded collar *b*, nipple *b'*, plain collar *c*, tail-piece *d*, screw-spindle *e*, supply-pipe *f*, tap *g*, jet *g'*, screen-plate *h*, nozzle *i*, socket-rod, *k'*, with base-plate k^2, terra-cotta tube *l*, cap-plate *m*, dome *n*, nut *o*, cage *p*, crown or rim *p'*, tripod base *q*, and vaporizer *r*, with screw-pin *s*, all respectively constructed, combined, arranged, and fitted substantially in the manner and for the purposes hereinbefore described and shown.

388,433. FISHING-ROD HOLDER. Absolom F. Meisselbach and William Meisselbach, Newark, N. J. Filed May 5, 1888. Serial No. 273,003. (No model.)

Claim.—1. In a fishing-rod holder, the combination, with the standard provided with a fastening device at its lower end and a ball at its upper end formed integral therewith, of a carrier provided with arms for supporting the fishing-rod, and a split socket at the junction of such arms, one half of the said socket being formed integral with the carrier, and the other half consisting of a removable cap secured thereto by means of ears *r* upon both halves of the split socket, and screws *b'* and b^3, substantially as shown and described.

2. In a fishing-rod holder, the combination, with a standard forked at its lower end and provided with a seat, *o*, of a clamp-yoke pivoted thereto and provided with a clamp-screw, as and for the purpose set forth.



3. In a fishing-rod holder, the combination, with the standard *c*, forked at its lower end and having seats *o o'* thereon, of the clamp-yoke *e*, pivoted thereto and provided with the clamp-screw *e'*, substantially as and for the purpose set forth.

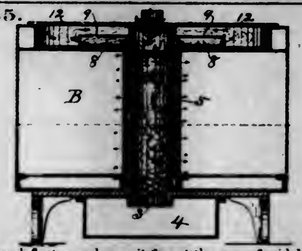
4. In a fishing-rod holder, the combination, with the carrier having arms a a^2, provided, respectively, with forks a' a^3, of a standard connected to such carrier by means of a ball-and-socket joint constructed as described, and a fastening device upon the base of the standard, as and for the purpose set forth.

5. In a fishing-rod holder, the combination, with the carrier having arms a a^2, provided, respectively, with forks a' a^3, having a covering, a^4, as described, of a standard connected to such carrier by means of a ball-and-socket joint constructed as described, and a fastening device upon the base of the standard, as and for the purpose set forth.

6. In a fishing-rod holder, the combination, with the carrier having arms a a^2, provided, respectively, with forks a' a^3, of a leaf-spring, *s*, pivoted at one end upon the fork a^3, and having a fork, *s'*, secured to its other end, as and for the purpose set forth.

388,434. WOOD RACK AND CARRIER. William H. Moody, Pittsfield, Me. Filed June 13, 1888. Serial No. 276,911. (No model.)

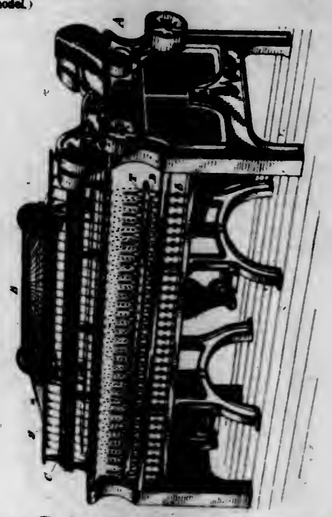
Claim.—1. A wood rack and carrier composed of the horizontal bar B, forming handles *b'* at the ends, the transverse bars connecting the side rails of the frame B, and strips I, secured to the transverse bars, forming the bottom and sides of the device, substantially as described.



2. A wood rack and carrier composed of the horizontal frame B, having the integral handles *b'* thereon, the transverse equidistant bars C, secured to and having the projections D above the said frame, and the strips I, secured to said transverse bars and forming a bottom to the device, and sides thereto up to the frame B, substantially as specified.

3. The herein-described wood rack and carrier composed of the horizontal frame B, having the integral handles *b'*, the inner and outer transverse bars C, having the upstanding ends D, and the wooden strips I, secured between the said transverse bars, substantially as specified.

388,435. CHARCOAL-BURNING COOKING-STOVE. Charles Mosher, Syracuse, N. Y. Filed Aug. 4, 1887. Serial No. 246,099. (No model.)



Claim.—The combination, in a stove, of an oven provided with an oval fire-pot passing vertically through the center thereof and formed tapering at its upper portion and provided at its lower portion with a suitable grate and an ash-pan below said grate, an oval perforated wall surrounding the fire-pot and extending upward the height of the oven and sufficiently separated from the fire-pot to form a radiating-chamber, a convex deflector-cover situated at the top of the fire-pot, horizontally-mounted deflecting flues arranged at opposite sides of the fire-pot and connecting therewith a short distance be-

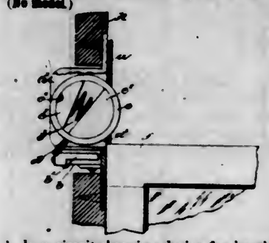
388,435.

low the convex deflector, and an exit-flue at the rear of said deflector-cover, all constructed and operating substantially as described.

388,436. ART OF PREPARING YARN FOR FILLING, &c. Roscius C. Newell, Palmer, Mass. Filed June 24, 1886. Serial No. 206,175. (No model.)

Claim.—1. The improvement in the art of preparing yarn for filling or other purposes, which consists in winding the yarn from beams onto shuttle-bobbins while simultaneously therewith increasing or diminishing the twist therein, substantially as described.

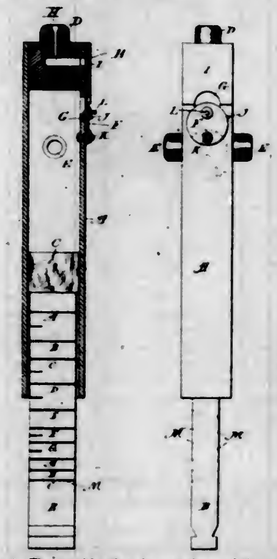
2. The improvement in the art of preparing yarn for filling or other purposes, which consists in winding the yarn upon beams and re-winding it therefrom upon bobbins while simultaneously therewith increasing or diminishing the twist therein to regulate the amount of said twist, substantially as described.



388,437. HAND-STAMP. Henry H. Norrington, West Bay City, Mich. Filed June 29, 1887. Serial No. 242,924. (No model.)

Claim.—1. In an organized hand-stamp, the combination of the case, the printing-base attached thereto having central opening, the yoke passing over said case, the handle and spring for operating said yoke, and the spool located in said case on the revolving shaft, said shaft journaled in the vertical end portion of said yoke and having a thumb-wheel at one end, the spool having mounted on its periphery a series of printing characters and an interposed series of reading characters, the spool adapted to be plunged into and withdrawn from the opening in the printing-base, as and for the purposes specified.

2. In combination with the case having the opening D', the detachable base having the opening D, the yoke encircling the case, the spool located in said case on the shaft *f*, said shaft journaled in the depending ends of said yoke, the printing and reading characters mounted alternately on the periphery of the spool, the handle and coiled spring for lowering and raising the spool within the case, substantially as specified.



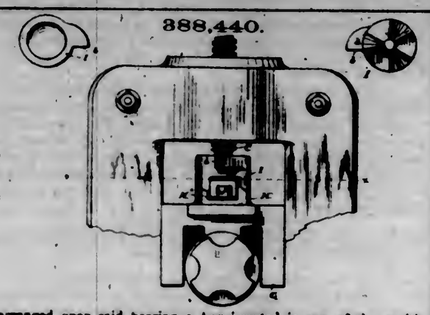
388,438. CIRCUIT-CHANGING DEVICE FOR BURGLAR-ALARMS. Frank H. Nutter, Malden, Mass. Filed June 20, 1888. Serial No. 278,174. (No model.)

Claim.—1. In a circuit-changing device for burglar-alarms, the fixed contact-spring and its support, combined with the open ring or ferrule, having within it two independently-movable spring-controlled blocks, c' c^2, and the pin c^4, upon which the said ring or ferrule moves, substantially as described.

2. The ring or ferrule c and the blocks c' and c^2, placed therein and normally held separated by the spring c^3, combined with the pin c^4, upon which the ring or ferrule moves eccentrically on the main frame, substantially as described.

388,439. CUCKOO. George R. Olney, St. Louis, Mo. Filed Mar. 24, 1887. Serial No. 232,813. (Model.)

Claim.—1. The combination, in a cuckoo, of the mouth-piece D, having the air-passage H, the air-exit G, and the pivoted cap F, substantially as described.



2. In a cuckoo, the main air-chamber having, in addition to the mouth-piece D, the air-passage H, and the main air-exit G, the major third and the minor-third openings E E, substantially as and for the purpose described.

3. The combination, in a cuckoo, of the mouth-piece having the air-passage H, the main air-exit G, capable of being enlarged and diminished, and the major-third and minor-third openings, substantially as described.

388,440. PROTECTING DEVICE FOR ROLLING-MILLS. James Paton, Cleveland, Ohio. Filed June 20, 1888. Serial No. 278,427. (No model.)

Claim.—1. In combination with a set of rolls, the face of the upper bearing provided with cams, a cap with corresponding cams

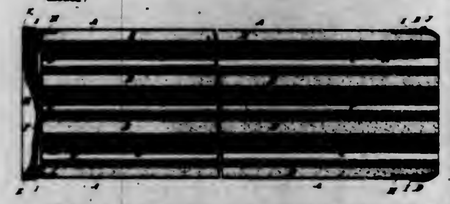
388,440.

arranged upon said bearing, a key inserted in one of the cavities formed by the notches thereof, and means for holding said key, with the cams bearing one upon the other and subjected to the action of the screw in the housing, substantially as and for the purpose set forth.

2. In combination with a set of rolls, the bearing G, provided with cams, the cap I, having corresponding cams, of the loop L, supported by said bearing and surrounding the cams thereof, the key J, guided in said loop, the wedge M and set-screw N, for retaining said key within the cavities formed by said cams, substantially as and for the purpose set forth.

3. The loop L, terminating in a sleeve having a horizontal slot extending through said sleeve for the displacement of a wedge, M, said wedge acting upon the key J and the set-screw N upon the wedge, in combination with the cap I, interposed between the bearing G and the screw C, substantially as described, and for the purpose specified.

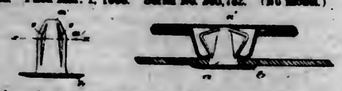
388,441. VEHICLE-SEAT. John M. Perkins, South Bend, Ind. Filed Nov. 9, 1887. Serial No. 254,697. (No model.)



Claim.—1. In a vehicle-seat, a base provided with a double groove composed of an inclined groove to receive the back and a groove back of the former one to receive a fillet, substantially as described.

2. In a vehicle-seat, in combination with the back, the base provided with the inclined groove to receive the back, and a slot above said groove to receive a filling, whereby the access of dirt or moisture to the lower groove is prevented, substantially as described.

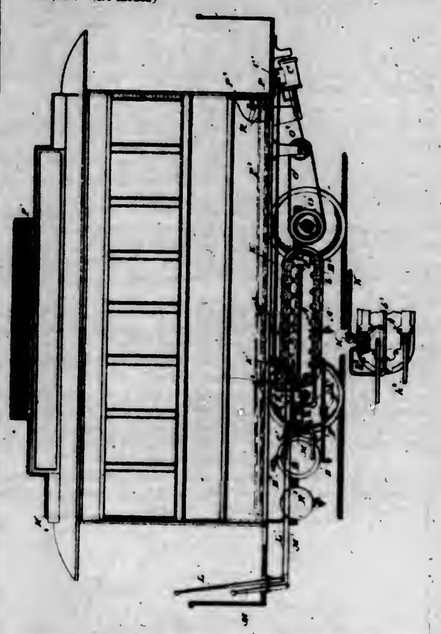
3. In a vehicle-seat, in combination with the back made of any suitable material, the base of the seat-frame provided with an inclined groove, C, to receive the back, a deeper inclined groove, D, set back of the groove C, to receive a fillet, said fillet, and suitable means for securing said fillet in place against the back, and a slot above the inclined groove C, to also receive a fillet, substantially as described.



388,442. UNDERGROUND ELECTRIC CONDUIT. Edward H. Phipps, New Haven, Conn. Filed Apr. 4, 1888. Serial No. 269,609. (No model.)

Claim.—1. A combined ring and perforated diaphragm for the ends of multitubular conduit-sections, the ring and diaphragm being made in one piece and, the ring having a sleeve, a hollow shoulder, and one member of a universal joint, and the diaphragm having perforations and being located within and between the two ends of the ring, substantially as set forth.

2. A conduit-section having a metal shell, a cement or composition filling therefor provided with two or more parallel passages and two rigid metallic rings respectively located in opposite ends of the shell and adapted to form the opposite members of a universal joint, one of such rings having a diaphragm made integral with it and adapted to inclose the end of the section, and having openings respectively arranged in alignment with the passages of the filling, substantially as set forth.



388,443. BUTTON-FASTENER. Clark M. Platt, Waterbury, Conn. Filed Mar. 1, 1888. Serial No. 265,782. (No model.)

Claim.—1. A rivet having a head and a shank having variably-reduced grooves extended longitudinally for a portion of the distance between its head and its entering end or point, as and for the purpose described.

2. A tubular rivet having a head and shank grooved longitudinally part way between its head and its entering end or point to weaken it, substantially as described.

388,444. PROPELLING AND HEATING STREET-CARS. William B. Prall, Washington, D. C., assignor to the National Tramway Motor Company, New York, N. Y. Filed Mar. 31, 1888. Serial No. 269,087. (No model.)

Claim.—1. In an apparatus for propelling street-cars, the combination of a superheated-water tank, a heat-storage tank provided with evaporating and expanding tubes surrounding the same, and said pipes provided with valves connecting the superheated-water tank with said tubes, substantially as shown and described.

2. The combination, with a superheated-water tank, a heat-storage tank provided with evaporating-tubes surrounding the same, and an evaporating tube or coil within the same, of pipes provided with controlling cocks or valves forming communications between the superheated-water tank and the said tubes, substantially as shown and described.

3. The combination of the superheated-water tanks, the heat-storage tank, the evaporating-tubes, the pipes connecting the superheated-water tank and the evaporating-tubes, and the back-pressure pipe provided with the back-acting valve F, substantially as shown and described.

4. The combination of the superheated-water tank and the heat-storage tank provided with evaporating-tubes, said tanks being connected by means of pipes communicating with the upper and lower portion of the water-tank, said pipes being controlled by a valve or valves in such a manner as to cause the flow of either superheated water from the bottom or saturated steam from the top of the superheated-water tank into the evaporating-tubes.

5. The combination of the superheated-water tank and the heat-storage tank provided with evaporating-tubes, pipes connecting the water-tank with the evaporating-tubes, pipes connecting the evaporating-tubes with the engine, and valves controlling said pipes operated by one common lever in such a manner as to admit water or steam to the evaporating-tubes at the same time that steam is admitted from the tubes to the engine, and to shut off the supply of water or steam to the evaporating-tubes simultaneously with cutting off the supply of steam to the engine.

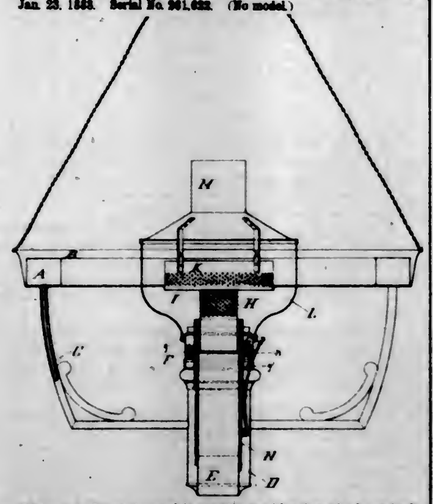
6. The combination, with the superheated-water tank, the heat-storage tank provided with the evaporating-tubes within and around the same, and pipes connecting the water-tank with the evaporating-tubes, of a three-way valve placed in said pipes, so arranged that the water or steam from the superheated-water tank may be admitted either through the evaporating-pipe within the storage-tank or be shut off therefrom and caused to enter the evaporating-tubes around the storage-tank, substantially as shown and described.

7. The combination of the superheated-water tank, the heat-storage tank provided with evaporating-tubes, the pipes connecting the water-tank with the evaporating-tubes, the engine, and a condenser connected with the exhaust of the engine, substantially as shown and described.

8. The combination of the superheated-water tank, the storage-tank provided with the evaporating-tubes, pipes connecting the water-tank with the evaporating-tubes, the engine, the condenser, the radiating pipes or coils within the car, and pipes connecting the condenser, the radiating-coils, and the exhaust of the engine, substantially as shown and described.

9. A heat-storage tank provided with evaporating-tubes on the outside thereof, said tubes being covered with non-heat-conducting material, substantially as shown and described.

10. A heat-storage tank provided with evaporating-tubes within and outside of the same and non-heat-conducting material over the other tubes, substantially as shown and described.

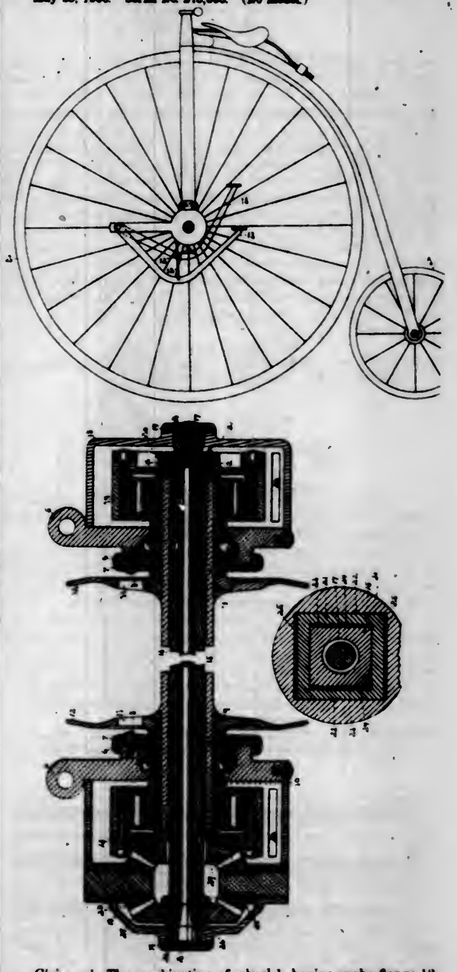


11. A heat-storage tank provided with an evaporating-chamber, b^3, evaporating-tubes b, and non-heat-conducting material on the outside of said tubes, substantially as shown and described.

12. A heat-storage tank provided with an evaporating-chamber, b^3, and evaporating-tubes b and b^2, substantially as shown and described.

13. The combination of the tank B, the tank A, provided with the evaporating-tubes, the pipes connecting tank B with said tubes, the three-way valves H and H', and the steam-valves K', the said valves H and K' being operated together, and the pressure-reducing valve h', substantially as shown and described.

14. The combination of the tanks B and A, the tank A being provided with evaporating-tubes, the pipes c and c', connecting the tank B with said tubes, provided with valves H, H', and h', and the pipe F, provided with valve F', substantially as shown and described.



388,445. CENTRAL-DRAFT LAMP. Frank Reino, Meriden, Conn., assignor of one-half to Edward Miller & Company, same place. Filed Jan. 23, 1883. Serial No. 361,632. (No model.)

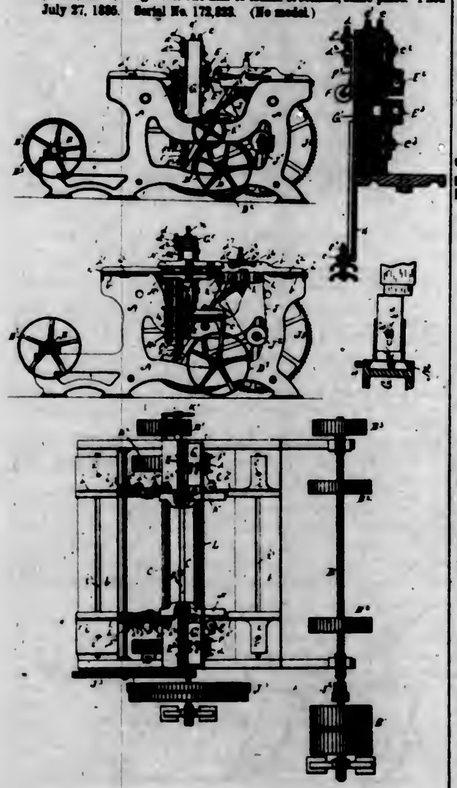
Claim.—1. In an Argand lamp, the combination of a lamp-body, an annular opening or collar in the top of said lamp-body, a detachable burner portion adapted to engage in said opening, a notch or recess in the periphery of said detachable portion, and a wick-adjusting draw-bar or handle adapted to move in said notch or recess, substantially as described.

2. In an Argand lamp, the combination of a lamp-body, a central air-supply tube passing through said lamp-body, an annular opening or collar in the top of said lamp-body, a detachable burner portion adapted to engage in said annular opening, a notch or recess in the periphery of said detachable portion, a wick-adjusting sleeve surrounding said central air-supply tube, and a draw-bar or handle attached to said sleeve and adapted to move in said notch or recess, substantially as described.

388,446. VELOCIPEDE. David H. Rice, Brookline, Mass. Filed May 25, 1883. Serial No. 375,060. (No model.)

Claim.—1. The combination of wheel 1, having spoke-flange 12, with an opening, 11, through the same, and the ball-bearing on which it runs, having the part thereof on one side of the balls formed of two rings or collars embracing the balls, and secured to each other by screws 8 on the side next to said spoke-flange and in position to be brought opposite the opening therein, substantially as described.

2. The combination of the wheel-hub having extensions 9 9, and supported by bearings thereon in the machine-frame, the clutch-drums supported and revolving upon said extensions, the shaft 15, passing through the wheel-hub, supported upon a running-bearing independently of the latter, and provided with mechanism connecting it with one clutch-drum and reversing its motion with relation thereto, and



a universal joint connecting said shaft to the other clutch-drum, arranged to allow said shaft to adapt itself to the variations between its running-bearing and that of the drum while being driven by the latter, substantially as described.

3. The combination of the drum 14, having the axial hole through the same provided with two opposite flat parallel faces, the sleeve 21, provided with corresponding exterior flat parallel faces, 22, fitting against the same and free to move laterally parallel thereto in the hub of the drum, and also provided with two internal flat parallel faces substantially at right angles to said external ones, and the shaft 15, provided with two flat parallel external faces fitted against the said internal ones of the hub and free to move laterally parallel thereto in the sleeve, the whole forming a universal-joint mechanism arranged to drive the shaft by the drum, or vice versa, substantially as described.

4. The combination of the wheel-hub having extensions 9 9, and supported by bearings thereon in the machine-frame, the clutch-drums supported and revolving entirely upon said extensions, the shaft 15, passing through the wheel-hub, supported upon a running-bearing independently of the latter and connected to one clutch-drum and revolving therewith, the gear-wheel 27, attached to the other end of said shaft, the gear-wheel 29, attached to the other clutch-drum and carried by it, and the pinion 28, connecting said gear-wheels and having its axis placed vertically in the machine-frame, whereby the gear 29 is free to adjust itself thereto, substantially as described.

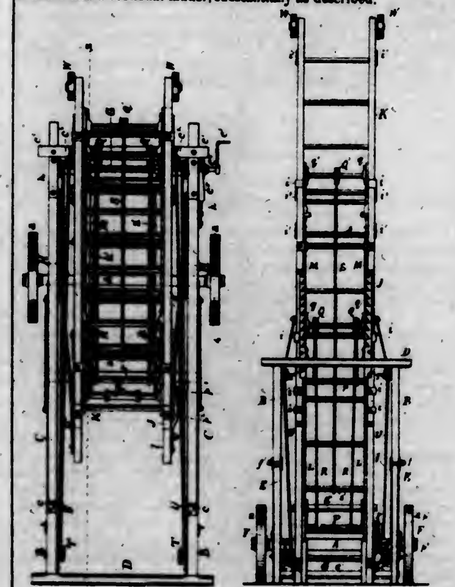
5. The combination of the wheel-hub having extensions 9 9, and supported by bearings thereon in the machine-frame, the clutch-drums supported and revolving entirely upon said extensions, the shaft 15, passing through the wheel-hub, supported upon a running-bearing independently of the latter and connected to one clutch-drum and revolving therewith, the gear-wheel 27, attached to the other end of said shaft, the gear-wheel 29, attached to the other clutch-drum and carried by it, and the two pinions 28 28, connecting said gear-wheels and having their axes placed vertically in the machine-frame, whereby the gear 29 is free to adjust itself thereto, substantially as described.

388,447. BLIND-FINISHING MACHINE. Lewis Rivers, Worcester, Mass., assignor of one-half to Adam Cruikshank, same place. Filed July 27, 1886. Serial No. 172,223. (No model.)

Claim.—1. The combination, with the movable heads G, carrying a series of revolving cutters, and an endless chain by which the work is fed to said cutters, said chain being moved in a fixed way, of the side guides, j' and j'', attached to plates i, said plates i being laterally adjustable to correspond with the position of said movable heads, substantially as described.

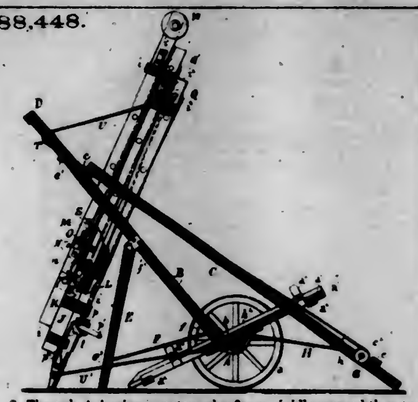
2. The combination, with the movable heads G, carrying a series of revolving cutters, and an endless chain moved in a fixed way between said heads, of the side guides, $j'j''$, laterally adjustable to correspond with the position of the movable heads, side friction-rolls, j^3, journaled in arms j^4, top friction-rolls, j^5, journaled in arms j^6, said arms j^4 j^6 being attached to the side guides, as described.

3. The combination of a fixed chainway, an endless chain moving in said way, by which the work is fed, a series of revolving cutters supported by a pair of movable heads, and a pair of movable heads laterally adjustable with reference to said fixed chainway, substantially as described.



4. The combination of a fixed chainway and an endless chain moving in said way, by which the work is fed, a series of revolving cutters supported by a pair of movable heads, a pair of movable heads laterally adjustable with reference to said chainway, and an actuating-screw provided with a right and left hand screw-thread, whereby the movable heads are conjointly adjusted, substantially as described.

5. The combination, with a pair of horizontal cutters, of the plates M', sliding vertically in ways, the upper and lower pressure-bars, N and N', attached to said sliding plates, and the adjusting-screws n and n', substantially as described.



6. The combination, with a pair of movable heads, G, each carrying revolving cutters and each laterally adjustable, of a graduated brace-rod, m, as and for the purpose described.

388,448. EXTENSION FIRE-LADDER. Thomas W. Russell, Union Bridge, Md. Filed Nov. 19, 1887. Serial No. 255,670. (No model.)

Claim.—1. The axle A, having a rectangular frame rigidly secured thereto, said frame having a rabbet formed on its side pieces and being provided with posts secured to said pieces, combined with the beams B and C and a sectional ladder, substantially as described.

388,448.

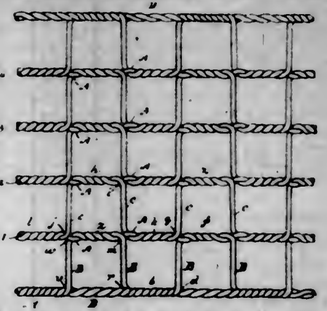
2. The axle A, having a rectangular frame rigidly secured thereto, said frame having a rabbet formed on its side pieces and being provided with posts secured to said pieces, combined with the beams B and C, braces E, rods F and H, and a sectional ladder, substantially as described.

3. The beams C C, having the shaft G mounted in suitable bearings thereon and provided with a ratchet-and-pawl mechanism, the beams B B, provided with pulleys at their free ends, the braces E, rods F and H, and the axle A, combined with a sectional ladder and ropes attached to the upper ends of the stiles of one of the sections and leading over the said pulleys to the shaft G, to be wound thereon substantially as set forth.

4. The ladder-sections I J K, having the guides *i*, and a system of ropes and pulleys operated by a revolving shaft having a ratchet-and-pawl mechanism for extending said ladder-section, combined with a truck, rods connecting the foot of the section I with the axle of said truck, beams B and C, suitably connected and braced to said truck, and ropes leading from the top of the section I over pulleys at the upper end of the beams B to a shaft mounted in the beams C near their lower ends, substantially as and for the purpose specified.

5. The ladder-sections I J K, having the guides *i* and stops *i'*, and a system of ropes and pulleys for operating said sections, the sections I and J being also provided with ratchet-plates L and M, combined with the spring-pawls N, mounted on the stiles of the sections J K and adapted to engage with the teeth of said ratchet-plates, and a catch consisting of a spring-actuated hook, substantially as described, for holding the pawl out of engagement with the ratchet-teeth, as specified.

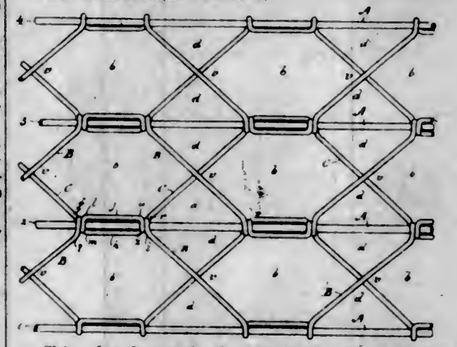
388,449. METALLIC LATHING. Benjamin Scarlis, Clinton, Mass., assignor to the Clinton Wire Cloth Company, same place. Filed June 2, 1887. Serial No. 240,040. (No model.)



Claim.—1. As a new article of manufacture, a metallic lathing having a body composed of wire-cloth and provided at intervals with furrings formed integral therewith and extending across the same, said furrings being closed or nearly closed on the side adjoining the body of the cloth, substantially as described.

2. As a new article of manufacture, a metallic lathing having a body composed of wire-cloth A of lateral and longitudinal strands and provided at intervals with furrings B, formed integral therewith and extending laterally across the same, said furrings being closed or nearly closed on the face of the cloth, in combination with small staples *s*, embracing a lateral strand at the extreme rear of the furring and extending into the wall, substantially as described.

3. As a new article of manufacture, a metallic lathing having a body composed of wire-cloth A of lateral and longitudinal strands and provided at intervals with furrings B, formed integral therewith and extending laterally across the same, said furrings being closed or nearly closed on the face of the cloth, in combination with small staples *s*, embracing a lateral strand at the extreme rear of the furring and extending into the wall, and a larger staple, *m*, embracing a number of lateral strands in the body of the cloth and furring and also extending into the wall, substantially as described.

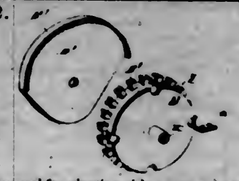


388,450. WIRE FENCE. Benjamin Scarlis, Clinton, Mass., assignor to the Clinton Wire Cloth Company, same place. Filed Aug. 24, 1887. Serial No. 247,702. (No model.)

Claim.—1. In a fence of the character described, the combination of the body-wire A and filling-wires B C, said body-wire being alternately twisted with said filling-wires to form the connecting-joints *e k f*, substantially as described.

2. The improved fence herein described, the same consisting of the body-wires A, filling-wires B C, and selvage-wires D, the body-wires being alternately twisted with the filling-wires B C to form the joints *e k f*, and the exterior filling-wires, B, along each edge of the fabric, with the selvage D to form the joints *t b*, the whole being combined and arranged substantially as described.

388,451. WIRE FENCE. Benjamin Scarlis, Clinton, Mass., assignor to the Clinton Wire Cloth Company, same place. Filed Aug. 27, 1887. Serial No. 248,096. (No model.)



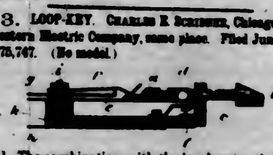
Claim.—In a fence of the character described, the combination of the body-wire 2 and filling-wires B C, the wire B being coiled around said body-wire, as shown at *i i*, and provided with the loop A between its said coils, and the wire C coiled around said body-wire, as shown at *l u*, and provided with the loop *j* between its said coils, the coils *i i* of the wire B and the coils *l u* of the wire C respectively engaging each other in addition to passing around the body-wire, substantially as described.

388,452. COMBINED CORN AND COTTON PLANTER. James D. Schofield, Rodgers, Tex., assignor to James P. Reed, same place. Filed Mar. 29, 1888. Serial No. 268,818. (No model.)

Claim.—1. The combination, in a planter, of the hopper, the seed-wheel extending into the bottom of the hopper and having the peripheral seed cups or depressions and the peripheral projecting teeth, means, substantially as set forth, to rotate the said seed-wheel, and the plate D', having the curved flange E', adapted to cover or uncover the peripheral teeth on the upper side of the seed-wheel, whereby the

388,452.

machine may be used for planting either corn or cotton, substantially as described.



2. The combination, in a planter, of a hopper, the revolving shaft K' therein, having the stirring-arms L', the revolving shaft X, arranged under the bottom of the hopper, the seed-wheel secured to said shaft, having the seed cups or depressions and the peripheral projecting teeth, the upper side of said seed-wheel extending through an opening in the bottom of the hopper, and the cut-off plate D', having the flange E', adapted to cover or uncover the peripheral teeth of the seed-wheel, for the purpose set forth, substantially as described.

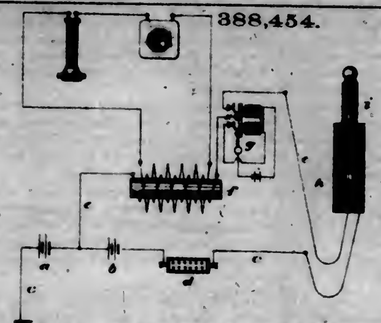
3. The combination, in planter, of the hopper, the revolving seed-wheel extending into the bottom of the same and having the peripheral seed cups or depressions and the peripheral projecting teeth, and the plate D' on the axis of the seed-wheel and having the curved segmental flange E', extending over the seed-wheel, substantially as described.

4. The combination, in a planter, of the standard P, the boot inclosing the lower end of said standard and having the slots T, the bolt extending through the said standard engaging the said slots and having the clamping-nuts to secure the boot at any desired vertical adjustment on the standard, said boot having the furrow-opener, substantially as described.

5. The combination, in a planter, of a hopper having the bottom provided with the lower flat portion, N, and the curved portion O, and provided with the bottom opening, C, the shaft K', revolving in the hopper over the flat portion thereof and having the radial stirring-arms, the revolving shaft X, having the seed-wheel provided with the peripheral seed cups or depressions and with the peripheral teeth, said seed-wheel having its upper side extending through the opening C, and the plate D', having the curved flange E', adapted to cover or uncover the peripheral teeth of the upper side of the seed-wheel, substantially as described.

388,453. LOOP-KEY. Charles R. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed June 1, 1888. Serial No. 275,747. (No model.)

Claim.—1. The combination, with the insulated spring or contact piece *c*, rigidly mounted at one end, of contacts *h* and *l* on opposite sides of one end or portion of said spring *c*, a guide, *d*, mounted upon said spring *c* and serving to support wedge *a* and its handle *b*, said handle extending through an opening in the facing *e*, said opening being somewhat larger than the shank of the handle, whereby on depressing said handle the spring *c* is separated from contact *h* and closed upon contact *l*, substantially as described.



2. The combination, with the handle *b*, of the wedge of insulating material *a*, carried thereby, said handle being mounted upon spring *c* in the guide *d*, and the spring *f*, adjusted to close upon its contact *g*, whereby on inserting the wedge under spring *f* spring *f* may be lifted from its normal contact, while on depressing the handle the position of spring *c* with respect to its contacts may be changed, substantially as described.

3. The combination of two or more listening-in and calling keys mounted upon the same strip, each of said keys consisting of the following elements: a wedge, *a*, and a handle, *b*, mounted upon a spring, *c*, a contact, *h*, with which contact-spring *c* is normally connected, a contact-spring, *f*, adjusted to close upon its normal contact, said spring being lifted therefrom on the insertion of the wedge, and the contact-strip *l*, common to the different keys, substantially as described.

4. The facing *e*, provided with openings for the handles of several keys, said opening being larger than the handles inserted through the same, respectively, in combination with springs *c*, one for each handle, each spring *c* being provided with a guide for its said handle, and a common contact-strip, *l*, whereby on depressing any handle the spring *c* thereof will be closed upon contact-strip *l*, substantially as described.

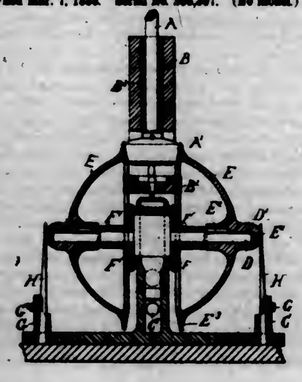
388,454. ELECTRIC RESISTANCE-MEASURING APPARATUS. Charles R. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed June 1, 1888. Serial No. 275,751. (No model.)

388,454.

Claim.—1. A resistance-measuring apparatus consisting, essentially, in a circuit including two batteries of substantially equal electro-motive force and a rheostat, a shunt-wire, including a current-indicating apparatus connected between said batteries at one end and at a point of the circuit beyond the rheostat at the other end, and a connecting device for closing said circuit with the circuit to be tested, substantially as described.

2. A resistance-measuring apparatus consisting, essentially, in the circuit *e*, including batteries *a b* and rheostat *d*, the shunt-circuit *c*, branched from point between said batteries *a b*, said branch or shunt *c* including the primary of an induction-coil, and a rheotome, a telephone included in the secondary coil of said induction-coil, and a switching device for connecting the terminals of circuits *c c* together while connection is made with the circuit to be tested, substantially as described.

388,455. METAL WHEEL. Eli Shaboneau, Toledo, Ohio. Filed Apr. 26, 1888. Serial No. 271,897. (No model.)

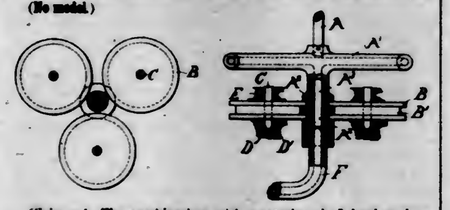


Claim.—1. In a metal wheel, a hub, a collar thereon having transverse perforations through the right-angled portion, in combination with return-spokes passed through the perforations and embracing the intermediate metal, as and for the purpose set forth.

2. In a metal wheel, a hub, a collar having an annular portion formed with an integral key or lug in parallel relation, a flange having perforations, spokes passed through the perforations, and a cap formed with grooves coincident with the keys or lugs, as and for the purpose set forth.

3. In a metal wheel, a hub, collars upon each end thereof having radial flanges formed with an annular depression, perforations through the flanges opening into the annular depression, and radial grooves from the perforations to the periphery thereof, in combination with caps secured upon the end of the collars and having radial grooves corresponding with the grooves in the flange, as and for the purpose set forth.

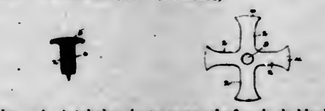
388,456. DRIVING DEVICE. Philip M. Sharples, West Chester, Pa. Filed Mar. 7, 1888. Serial No. 266,207. (No model.)



Claim.—1. The combination, with a shaft provided with a bevel-pinion, of wheels secured to separate shafts at right angles thereto and adapted to gear with said bevel-pinion at obliquely-opposite points, said shafts being out of line and adapted to be revolved in opposite directions, substantially as set forth.

2. The combination, with a shaft provided with a pinion, A', of a rotating shaft at right angles thereto, a wheel, E, feathered to the free end of said shaft and adapted to engage said pinion, and a spring, H, attached to a fixed point and in contact with the projecting hub of said wheel, substantially as and for the purpose set forth.

3. The combination, with a shaft provided with a pinion, A', of separate shafts at right angles thereto and rotated in opposite directions, wheels feathered to the outer ends of said shafts and adapted to engage said pinion, and springs attached to fixed points and adapted to press directly against the projecting hubs of said wheels, substantially as and for the purpose set forth.



388,457. ANTI-FRICTION STEP FOR SHAFTS. Philip M. Sharples, West Chester, Pa. Filed Mar. 10, 1888. Serial No. 266,894. (No model.)

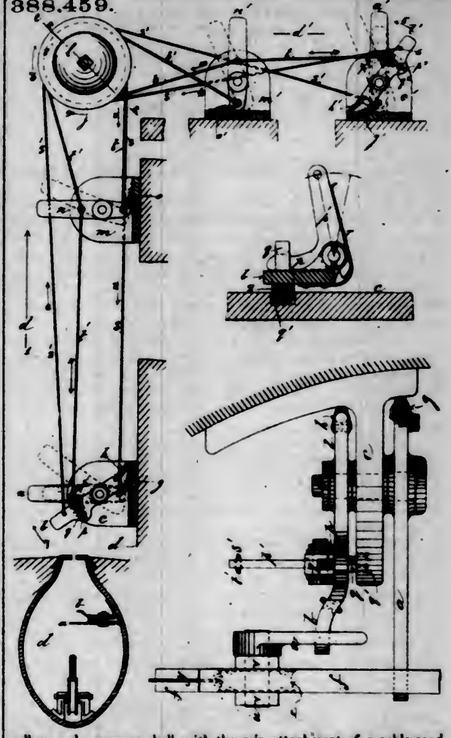
Claim.—1. The combination, with a rotating shaft having circular grooves A^1, of a disk of larger diameter than said shaft, with grooved face engaging said circular grooves, substantially as and for the purpose set forth.

2. The combination, with a rotating hollow shaft having intermediate circular groove or grooves and communicating with a fixed pipe, F, of one or more disks adapted to engage said grooves and to revolve in a plane at right angles to said shaft, substantially as set forth.

388,458. RIVET. Samuel W. Sherry, Boston, Mass. Filed Feb. 21, 1888. Serial No. 264,760. (No model.)

Claim.—1. A tubular rivet composed of a single blank having several independent adjacent upturned portions, 2, broadened upper ends, 4, the independent cap 5, and headed tack 6, substantially as described.

2. A tubular rivet strengthened by a detached independent tack or core placed loosely within it, the end of the said tack or core protruding from the bottom of the rivet, substantially as described.

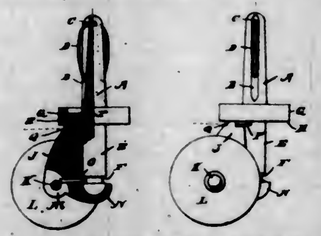


388,459. SIGNALING APPARATUS FOR CABLE STREET-RAILROADS. Henry W. Smith, St. Louis, Mo. Filed Jan. 19, 1888. Serial No. 261,271. (No model.)

Claim.—1. The combination of an arm or lever having a spring and pivoted to a bracket secured within the tunnel of a cable street-railroad, a chain or cord attached to said lever and to a sheave or pulley, and a spring located between the pulley and a gong or bell, with the grip attachment of a cable-road car, substantially as and for the purpose set forth.

2. The combination of two outermost arms or levers having springs and pivoted to a bracket within the tunnel of a cable street-railroad, one of said levers being provided with a locking device, a chain or cord attached to each of said levers and to a sheave or pulley, a spring located between the pulley and a gong or bell, an arm or lever intermediate to the outermost levers and the pulley, and a chain or cord attached to the intermediate lever and to the locking device of one of the outermost levers and attached to a sheave or pulley, with the grip attachment of a cable-road car and with a lever and spindle mounted thereon, said spindle having a drum or sheave from which a cord or wire extends to the spring mechanism of a gong or bell on the dummy, substantially as and for the purpose set forth.

3. In two cross-tracks of a cable street-railroad, the combination of the outermost arms or levers and intermediate lever and their appendages of one track and the corresponding parts of the other track, chains or cords extending, respectively, between the levers and locking device of one track to those of the other track and secured to intermediate sheaves or pulleys, and a spring located between one of said



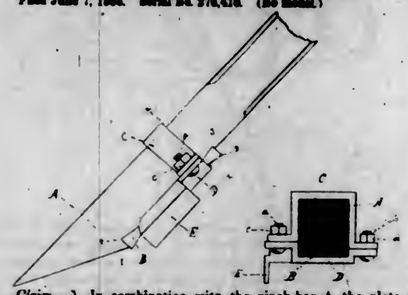
388,459.

pulleys and a gong or bell, with the grip attachment of a cable-road car and with a lever and spindle mounted thereon, said spindle having a drum or sheave from which a cord or wire extends to the spring mechanism of a gong or bell on the dummy, substantially as and for the purpose set forth.

4. The combination of a lever and spindle mounted on the grip attachment of a cable-road car, said spindle having a drum or sheave from which a cord or wire extends to the spring mechanism of a gong or bell on the car, with a pivoted lever or other intercepting device within the tunnel, substantially as and for the purpose set forth.

388,460. CASTER. Charles Stroud, Hamilton, Ohio. Filed Feb 27, 1888. Serial No. 265,445. (Model.)

Claim.—1. In a furniture-caster, the combination, substantially as set forth, of a foot-stem provided at its lower end with a bearing of oscillation, and at its upper end with a circular flange having a peripheral curtain, a wheel-housing united to said foot-stem and engaging said bearing of oscillation, and provided with an upward projection within said curtain, an axle carried by said housing, and a pair of floor-wheels on said axle.

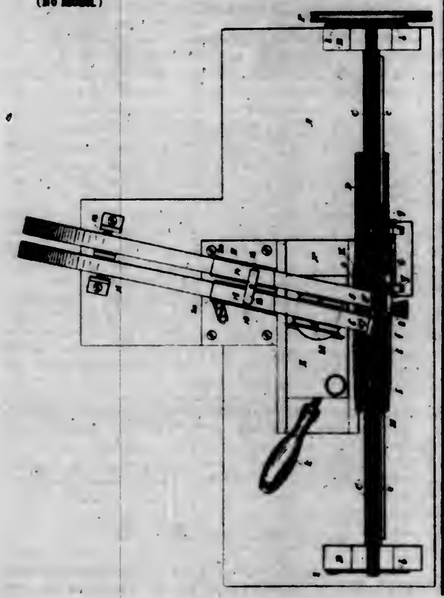


2. In a furniture-caster, the combination, substantially as set forth, of a foot-stem fitted for attachment to furniture, and having a rounded lower end provided with a circumferential groove, a wheel-housing provided with a stem-bearing engaging the lower end of the foot-stem, a wheel-axle carried by said housing, and a pin also carried by said

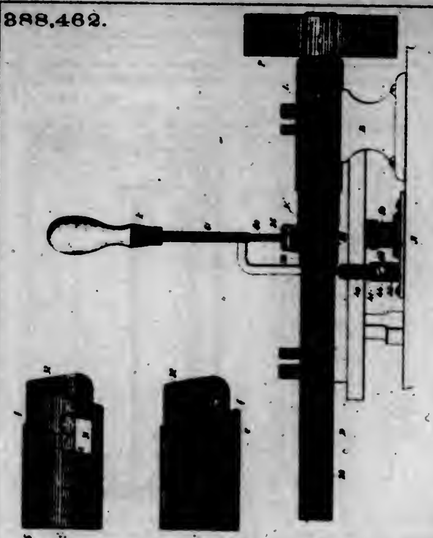
housing with its forward end engaging said circumferential groove and with its rear engaging said wheel-axle.

3. In a furniture-caster, the combination, substantially as set forth, of a foot-stem provided at its top with a circular flat flange having a peripheral curtain, and at its bottom with a bearing of oscillation and a circumferential groove, a journal-box engaging the stem just below said flange, a housing provided with a stem-bearing and with an upward projection engaging said journal-box within said curtain, and having a rearwardly-open notch in rear of the foot-stem, a wheel-axle carried by said housing and crossing said notch, a pair of floor-wheels upon said axle, and a pin carried by the housing at its notch and engaging its forward end with the circumferential groove of the foot-stem and its rear end with the wheel-axle.

4. In a furniture-caster, the combination, substantially as set forth, of a stem adapted for insertion into a leg-socket in furniture and to be held against rotation therein, and provided with one or more vertical longitudinal grooves or spring-spaces in its peripheral surfaces, and a spring secured to said stem and lying in each groove or spring-space and presenting a convexly-curved side located partly within the circumference of the stem and partly beyond such circumference.



388,461. PINCH-BAR. Alexander Stonedale, Walcott, Iowa. Filed June 7, 1888. Serial No. 276,410. (No model.)



Claim.—1. In combination with the pinch-bar A, the plate B, with its sharpened corners 1, 2, 3, and 4, secured to said pinch-bar by the stirrup C D, bolts *a* and *b*, and nuts *c* and *d*, substantially as described.

2. In combination with the pinch-bar A and plate B, the stirrup C D, with vertical plate E, secured upon said pinch-bar by the bolts *a* and *b* and nuts *c* and *d*, substantially as described.

388,462. MACHINE FOR MAKING PAPER TUBES. Charles S. Talmyr, Washington, D. C. Filed Dec. 6, 1887. Serial No. 257,120. (No model.)

388,462.

Claim.—1. In a machine for making tubes from strips of paper or other material, the combination, with the rotatory core, of the stationary feed-cams having oblique or helical faces for acting against the edges of the strips as they are wound upon said core, substantially as described.

2. The combination, with the rotatory core, of the stationary feed-cams having oblique or helical acting faces, said cams being in different positions relative to the length of said core, so that the strips will break joints, substantially as described.

3. The combination of the rotatory core, the feed-cams for acting on the edge of the strips as they are wound, the reels, the vessel for glue or other adhesive substance between said reel and core, and the roller for applying a coating of glue to one of said strips, substantially as described.

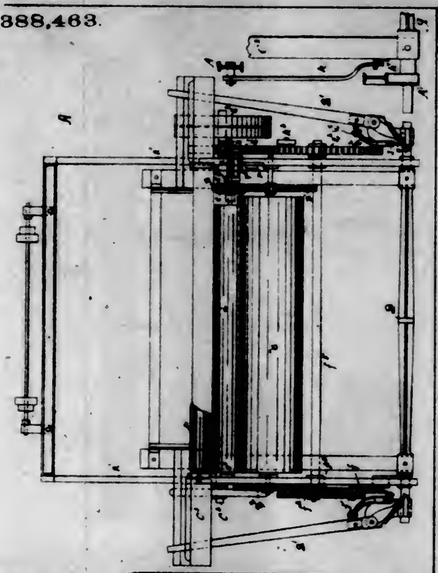
4. The combination of the rotatory core, the feed-cams having helical edges for acting on the strips as they are wound upon said core, and the guide and tension for said strips, substantially as described.

5. The combination of the core supported in bearings at one end only and the feed-cams for acting on the edges of the strips as they are wound upon said core and pushing the tube as formed off the free end of said core, substantially as described.

6. The combination, with the rotating core for winding strips of paper into the form of a tube, of the feed-cams comprising a sleeve or cylinder having helical acting edges formed therein, one for each strip composing the tube, substantially as described.

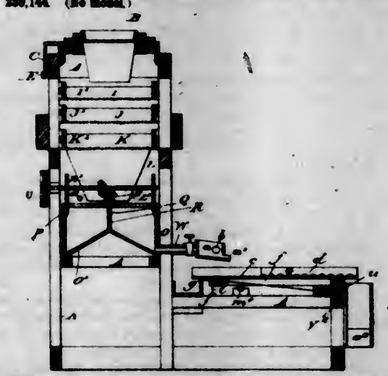
7. The combination of the rotatory core, the feed-cams having helical acting edges, and the spring-finger, substantially as described.

8. The combination of the rotating core, the feed-cams, the roller bearing against the meeting edges of the outer strip, and the spring for pressing said roller against the paper tube, substantially as described.



9. In a machine for forming tubes from strips of paper or other material, the combination, with feeding devices for advancing the strips as they are wound, of the core or mandrel circular in cross-section where the tube is formed and changing gradually to the form of a polygon, substantially as described.

388,463. LOOM. Henry Talbe, Paterson, N. J. Filed Mar. 21, 1887. Serial No. 231,937. (No model.)



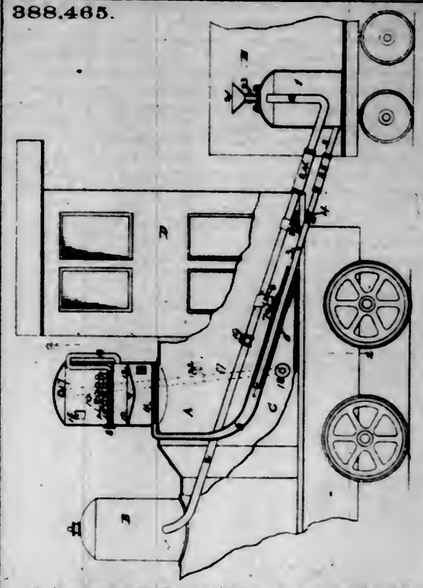
Claim.—1. The combination, with spindle D and spring thereon, and the bracket for supporting the spindle, of the flanges C C, adapted to impinge on the opposite sides of gear B, the gear B, the roller *d*, supported by the spindle, the roller *b*, gear B', nut M, and means for actuating roller *b* and its gear B', substantially as and for the purpose set forth.

2. The combination, with bar J, and screw H, arranged in said bar, by which the lever K^9 is raised or lowered to make the action of the cam thereon more or less forcible, of the lever K^9, bracket K, and bolt K', picker-stick *g'*, loop g^3, shaft *g*, the cam K^4, shaft J^9, and gear thereon, shaft O, the gear on said shaft, and the spring g^4, substantially as and for the purpose set forth.

388,463.

388,464. ORE-SEPARATOR. James Talley, Denver, Colo., assignor to Sarah B. Talley, same place. Filed May 23, 1887. Serial No. 239,144. (No model.)

Claim.—1. In an ore-separator, the combination of the double or twofold hopper, consisting of two separate divisions, each provided with an outlet, a frame supporting both divisions and provided with two pivotal pins on each of two opposite sides, bearings for such pins, and mechanism for lifting the frame and the pins alternately from and returning them to their bearings, substantially as set forth.



2. In an ore-separator, the combination of a series of amalgamating-pans having removable corrugated bottoms *d*, and the caps *e*, secured to the pans, substantially as set forth.

3. In an ore-separator, the combination of the longitudinal amalgamating-pans having removable corrugated bottoms with caps *e*, a pan table or carrier, and mechanism, as described, for giving the pan table and the pans thereon movements in two directions at a right angle to each other, substantially as set forth.

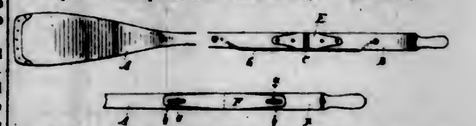
388,465. APPARATUS FOR THE MANUFACTURE OF GASEOUS FUEL. Andrew Tregroot, Pittsburg, Pa., assignor of two-thirds to John T. Mears, same place. Filed Apr. 6, 1887. Serial No. 233,895. (No model.)

Claim.—1. In apparatus for the manufacture of a gaseous fuel and illuminant, the combination of an oil-reservoir, a steam-pipe leading thereto and delivering thereinto above the oil-level, an oil-feed pipe leading therefrom, an incasing superheater-pipe into which the oil-feed pipe delivers, a branch pipe which connects the steam-pipe and the pipe which incases the oil-feed pipe, and suitable valves for controlling the several pipes, substantially as and for the purposes specified.

388,465.

2. In apparatus for the manufacture of gaseous fuel and illuminants, the combination of an oil-reservoir, a steam-pipe leading thereto and delivering thereinto above the oil-level, an oil-feed pipe leading therefrom, a superheater-pipe which incases the oil-feed pipe and into which the feed-pipe delivers, said latter pipe delivering into a carbureting-chamber, a carburetor having a lower deposit and an upper purifying-chamber, a branch pipe which connects the pipe that incloses the oil-feed pipe with the main steam-pipe, and suitable valves for controlling the several pipes, substantially as and for the purposes specified.

388,466. HOLDBACK FOR VEHICLES. James P. Van Duser, Boston Harbor, Mich. Filed Jan. 16, 1888. Serial No. 260,647. (No model.)

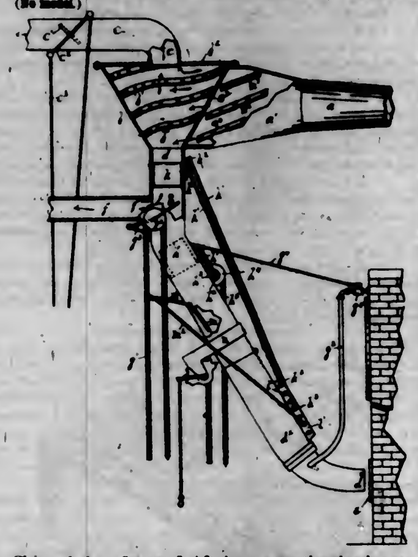


Claim.—1. A holdback attachment for vehicles, consisting of the holder A, provided with the tongue A', the spring A^3, with its beveled leg *a*, secured to the under side of a thill of a vehicle, in combination with the hook B, comprising the beveled leg B', the lug B^2, and the socket *b*, as and for the purposes specified.

2. In a holdback attachment for vehicles, the holder A, provided with the spring A^3, with its beveled leg *a*, the tongue A', and the side A^2, separated from said tongue and spring a distance equal to the thickness of a side of the hook B, secured to a thill of a vehicle, in combination with the hook B, as and for the purposes specified.

3. In holdback attachment for vehicles, the hook B, composed of the leg B', beveled at each end on the same side, the lug B^2, extending downward at an obtuse angle, the socket *b*, and the two sides embracing said elements and extending outward a short distance beyond the lug B', in combination with the holder A and the breeching of the harness, as and for the purposes specified.

388,467. SPRING-JOINTED BOAT-OAR. Charles S. Van Fleet, Troy, Pa. Filed Apr. 13, 1888. Serial No. 270,513. (No model.)



Claim.—1. A boat-oar consisting of two hinged sections having a spring uniting the said sections and serving to overcome the yield due to the hinge when the oar is in use, substantially as and for the purpose specified.

2. In a boat-oar, the combination of the blade-section, the handle-section, the hinge connecting the same together, and a leaf-spring, F, applied to the side opposite the hinge and connected at or near its end to both sections, substantially as described.

3. The combination, in a spring-jointed boat-oar, of the sections A B, the hinge E, connecting said sections, the spring F, applied to the side opposite the hinge, and the rail G on said oar and adapted to receive the oar-lock, all arranged to operate substantially as described.

388,468. FURNACE FUEL-FEEDER. Andrew Warne, Buffalo, N. Y. Filed Feb. 17, 1887. Renewed Nov. 28, 1887. Serial No. 256,126. (No model.)

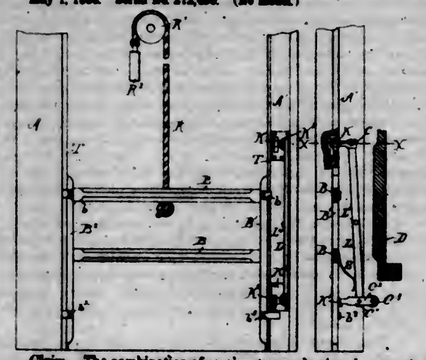
Claim.—1. In a furnace fuel-feeder, a separating-chamber consisting of an inverted-cone-shaped receptacle having a conduit for surplus air, and the conduit leading to the mill, provided at its entrance to said cone-shaped receptacle with inclined diverting-flanges, substantially as shown and described.

2. In a furnace fuel-feeder, the combination, with the fuel-conduit, of the steam-pipe for injecting steam into the conduit and having a valve the movement of which is controlled by a valve in said conduit, substantially as and for the purpose stated.

3. In a furnace fuel-feeder, a separator consisting of an inverted-cone-shaped receptacle provided upon its interior inclined surface with a helical or worm flange, substantially as and for the purpose stated.

4. In a furnace fuel-feeder, the combination, with a separator consisting of an inverted-cone-shaped receptacle provided upon its interior inclined surface with a helical or worm-shaped flange, of a conduit, *c*, leading to the mill, provided at its entrance to the cone-shaped receptacle with inclined diverting-flanges c^2, substantially as and for the purpose stated.

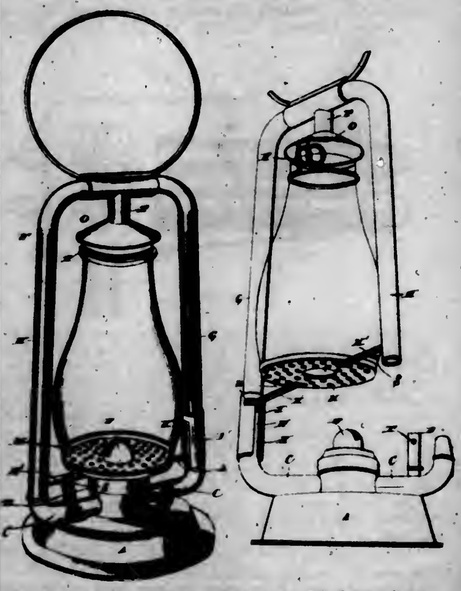
5. In a furnace fuel-feeder, the combination, with the inverted-cone-shaped receptacle provided with the helical or worm flange, of the conduit *c*, for surplus air, leading therefrom, provided with a valve for regulating the quantity of surplus air to be discharged, substantially as shown and described.



6. In a furnace fuel-feeder, the combination, with the cone-shaped receptacle having a helical or worm flange and the conduit *d*, together with its branches, of the hinged deflectors *h h*, for regulating the even distribution of the fuel to the said branches, substantially as shown and described.

7. In a furnace fuel-feeder, the combination, with the main conduit *d* and the auxiliary conduit *f*, leading to the shavings-room, of the pivoted valve *g*, adapted to close either one of said conduits, as desired, substantially as shown and described.

8. In a furnace fuel-feeder, the combination, with the main conduit and its branches, of the pivoted dividing-valve *h*, operated by the segmental gear h^1, worm h^2, pulley h^3, and the chain or belt, substantially as shown, and for the purpose stated.



9. In a furnace-fuel-feeder, the combination, with the valve *g*, operating to close either of the two conduits *d* and *f*, of the steam-valve, its steam-pipe leading into one of the branch conduits d^1, and connections from the said steam-valve to the said valve *g*, whereby the injected steam is automatically cut off when the said latter valve closes one of the said conduits *d f*, substantially as and for the purpose stated.

388,469. ELEVATOR. George A. Weld, Winchester, Mass. Filed May 1, 1888. Serial No. 272,469. (No model.)

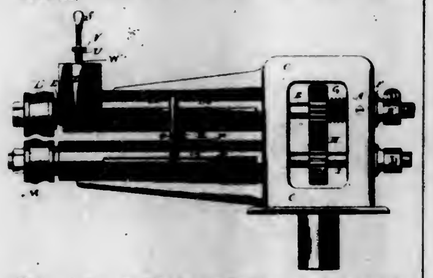
Claim.—The combination of an elevator-car having the cam-piece D, the lever L, having an arm, C, and the arm C', having an extension, C^2, the pivoted latches or stops, and the hatchway-gate having the arm b^2, all substantially as described, and for the purpose set forth.

388,470. TUBULAR LANTERN. William C. Whitney, Newport, Vt. Filed Nov. 14, 1887. Serial No. 255,126. (No model.)

Claim.—1. The combination, in a lantern, of the lower tube communicating with the burner and having the vertical ends D E of the upper tube having the devices to secure the globe, and having one of its arms connected to the end E and adapted to be swung horizontally and moved vertically thereon, the other arm of the upper tube being adapted to connect and disconnect with the end D, substantially as described.

2. The combination of the bowl having the tube C communicating with the burner and provided with the vertical ends D E, the tube F, having the depending arms G H, said arm G being secured on the end E, adapted to slide vertically and to turn thereon, and said arm H being adapted to connect with and disconnect from the end D, the sleeve I, secured to end E and having the vertical slot K and the horizontal

slot L communicating with the upper end thereof, the base-plate M, secured between the arms G H, and the bracket or arm N, projecting from the arm G and adapted to work in the slots K L, substantially as described.



3. The combination, in a lantern, of the tube C, communicating with the burner and having the vertical ends D E, the upper tube, F, having the depending arms G H, the former being connected to end E and movable vertically and revolubly thereon, and the latter being adapted to connect with end D, the base-plate or diaphragm M, secured between the said arms of the upper tube, and the spring-catch T, to lock the said upper tube to the lower tube, substantially as described.

4. The combination, in a tubular lantern, of the lower tube, C, attached to the bowl thereof and having the vertical ends D E, the upper tube, F, having the depending arms G H, said arm G being fitted on end E and adapted to move vertically and rotate thereon, the sleeve I, attached to end E and having the vertical slot K and the horizontal slot L communicating therewith, the base-plate or diaphragm M, the arm N, connecting the same to the arm G and adapted to engage the slots K L, the arm N', connecting said diaphragm with the arm H and having the stud S, and the spring-catch T, to engage said stud S when the upper tube is lowered, substantially as described.

5. In a lantern, the bowl having the burner and the lower tube, C, communicating therewith and provided with the upturned ends D E, in combination with the upper tube, F, having arm G, movable vertically and revolubly on the end E, and having the arm H, adapted to fit on the end D, a catch or locking device for holding the parts when in this position, and the globe-cone fitted to the upper tube, substantially as described.

6. In a tubular lantern, the bowl or base, the burner, and the lower tube, C, having ends D E, in combination with the upper tube F, having one arm, G, movable vertically and revolubly on the end, the other arm, H, of the upper tube fitting over the end D when the parts are in their normal position, a catch or locking device for holding the parts in this position, and the globe-supporting cone fitted to the upper tube, as set forth.

388,471. MACHINE FOR BEADING SHEET METAL. William J. Bayer, Southington, Conn. Filed Dec. 3, 1887. Serial No. 256,806. (No model.)

Claim.—1. In a machine for beading sheet metal, the combination, with a box cast in one piece and having at its rear end a continuous or solid wall provided with two openings and furnished at its forward end with two horns, of two shafts respectively located in such horns and each extending into such box and carrying a bead-roller, a coupler secured to the opposite faces of the horns and adjustable upon them, an operating-head for working the upper shaft, and an operating-screw flexibly connected with such head, substantially as set forth.

2. In a machine for beading sheet metal, the combination, with two parallel horns, each inclosing a shaft carrying a bead-roller, of a coupler binding such horns together and composed of two parts respectively secured to the opposite faces of the horns, substantially as set forth.

3. In a machine for beading sheet metal, the combination, with two parallel horns, each inclosing a shaft carrying a bead-roller, of a coupler binding such horns together, the horns being provided with ribs and the coupler with recesses to receive the same, the coupler being arranged to slide horizontally upon the horns, substantially as set forth.

4. In a machine for beading sheet metal, the combination, with two shafts, each carrying a bead-roller, of two rigid horns respectively inclosing each shaft, whereby each shaft is supported virtually throughout its length, and a coupler consisting of two parts applied to the opposite faces of such horns and united between the horns, substantially as set forth.

5. A machine for beading sheet metal, having two parallel horns, each provided with two ribs respectively located upon its opposite sides, and a coupler engaging with each rib and binding the horns together against pressure tending to spread them apart, substantially as set forth.

6. A machine for beading sheet metal, having two parallel horns, each provided with two ribs respectively located upon its opposite sides, and a coupler consisting of two slotted blocks, and a screw uniting them and applied to the horns to couple them together against pressure tending to spread them apart, substantially as set forth.

7. A machine for beading sheet metal, having two horns, a rocking driving-shaft extending through the upper horn, a yoke located upon such horn, an operating-head secured to the adjacent end of the shaft, an operating-screw mounted in the yoke, a rocking block pivoted to such head, and connection between such block and the screw, substantially as set forth.

388,472. WALL-PAPER. Frederick Dick, New York, N. Y. Filed May 31, 1887. Serial No. 239,572. (No specimens.)

Claim.—1. As a new manufacture, the herein-described compound waterproofed paper, composed of a base-sheet of paper treated with a waterproofing material and having a thinner sheet for the reception of the paste secured thereto, substantially as set forth.

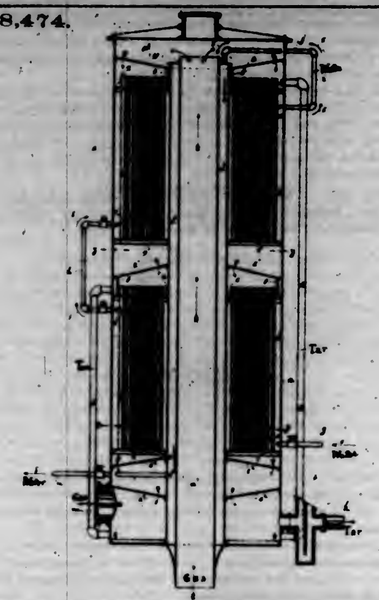
2. As a new manufacture, the herein-described compound waterproofed paper, composed of a base-sheet of paper treated with a waterproofing material and having a thinner sheet of paper for the reception of the paste secured thereto on one side and another decorated surfacing-sheet attached to the other side thereof, substantially as set forth.

3. As a new manufacture, the described compound waterproofed and embossed paper, composed of an embossed base-sheet of paper treated with a waterproofing material and having a surfacing-sheet of thinner paper for the reception of the paste secured thereto, substantially as set forth.

4. As a new manufacture, wall-paper comprising an interior waterproofed base-sheet of paper and a thinner backing-sheet, and another sheet attached to the opposite side of the waterproofed base-sheet, substantially as set forth.

388,473. GRATE. Frank S. Bussell, Pittsburg, Pa. Filed Oct 29, 1886. Serial No. 217,502. (No model.)

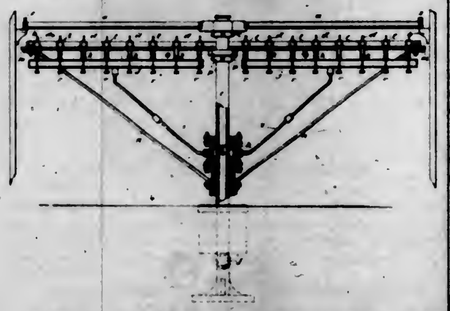
Claim.—1. The combination, with a grate having a vertical fire-front, F, of end plates or pieces, G, secured to the said front by pins and slots at the ends of the front, whereby said end pieces are adjustable longitudinally of the front to vary the length thereof, substantially as and for the purposes described.



2. The superposed and adjustable grate-frames A and B, the frame A having an opening, *e*, extending from its back toward the front thereof, and the frame B having a similar opening, *f*, registering with the hole *e*, substantially as and for the purposes described.

3. A grate for fire-places having a gas-burner space, *e*, open at the back of the grate and extending toward the front thereof, and a removable grating for covering said space, substantially as and for the purposes described.

388,474. GAS-CONDENSER AND TAR-SEPARATOR. Frederick Bessel, New York, N. Y. Filed Apr. 4, 1888. Serial No. 269,615. (No model.)



Claim.—1. In a gas-condenser and tar-separator, the combination of an upright outer casing, a gas-exit pipe, annular tiers of surrounding tubes, horizontal annular plates forming or inclosing water and gas tight chambers through which the tubes pass, conical perforated shields above each tier, alternate shields being inverted, tar-pipes extending from above each horizontal annular plate to the bottom of the apparatus, water-pipes connecting the several spaces between the tiers of tubes with a water-inlet, and a gas-exit pipe near the bottom of the casing, substantially as specified.

388,474.

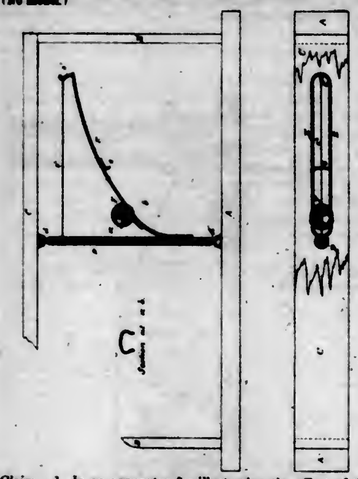
2. In a gas-condenser and tar-separator, the combination of an upright outer casing, a central vertical gas-exit tube extending from the bottom of the purifier nearly to the top thereof, tiers of annular series of vertical tubes surrounding said central tube, perforated plates over each end of the latter tubes and forming in each tier a water-space around the tubes thereof, and forming between the several tiers and above and below them annular chambers connected with said tubes, a truncated conical perforated shield in each of said chambers, alternate shields being inverted, a pipe extending from the bottom of each of the upper annular chambers to the bottom of the lower one, and water-connections for each tier of tubes, and a gas-exit provided near the bottom of the casing, substantially as specified.

388,475. APPARATUS FOR THE MANUFACTURE OF LAMP-BLACK. Samuel Cabot, Jr., Boston, Mass., assignor to Godfrey L. Cabot, Worthington, Pa. Filed Mar. 16, 1884. Serial No. 124,627. (No model.)

Claim.—1. The combination, in a multiburner-lamp, of a central supporting-standard with adjustable collars thereon, an external ring with the burner-tubes supported on said ring, and braces extending from said collars to the same, substantially as described.

2. A central vertical standard provided with adjustable clamping-collars and connecting-rods, a multiburner-lamp supported thereon, and a collection-plate having adjustable bearing on said vertical standard, substantially as described.

3. The combination, with a central vertical standard, of a multiburner-lamp supported thereby, an adjustable collar having a gas-chamber surrounding the standard, said collar provided with packing-borne at each end, and the standard having apertures to permit gas-escape into the collar, and connecting-pipes leading from the collar to the burners, substantially as described.



4. A revolving multiburner-lamp provided with an external ring of angle-iron braced to a central standard, with burner-tubes supported thereby, substantially as described, and an endless driving-chain resting in the angle of said external ring and encircling the same and the pulley of a suitable motor.

5. The multiburner-lamp composed of parallel tubes *l l*, external ring, *m*, supporting-bars *o o*, extending across the ring from side to side under the tubes *l*, an adjustable support under the center of said bars, and a suitable gas-supply device, all arranged and combined substantially as set forth.

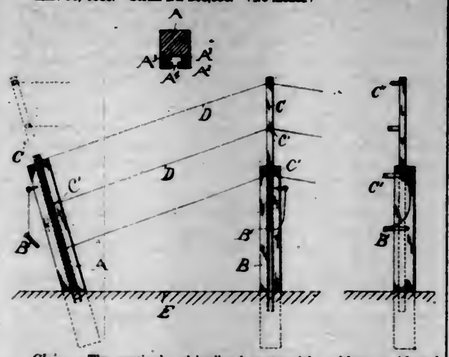
6. In a multiburner-lamp, the combination of a supporting-standard, provided with clamping-collars and stay-rods, with a revolving hopper, a revolving scraper, and an air-blast, substantially as described.

7. The combination, with a collection-plate, of rotating scrapers to operate thereon, an inclined hopper beneath the scrapers and rotating with them, and a circular stationary deposit-chamber, with which said hopper communicates by a chute, substantially as described.

388,476. APPARATUS TO ILLUSTRATE CENTRIFUGAL FORCE. John Coffin, Johnstown, Pa. Filed Apr. 12, 1888. Serial No. 270,492. (No model.)

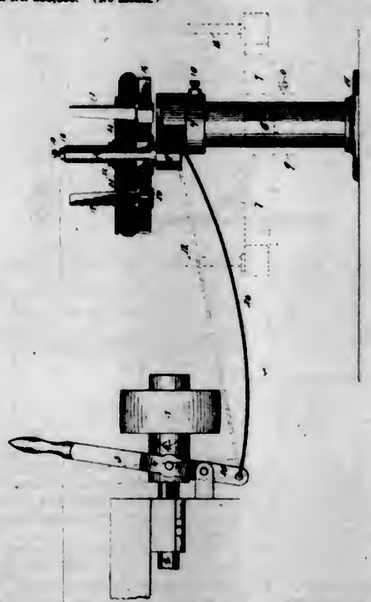
Claim.—1. In an apparatus for illustrating the effect of the central forces on heavenly bodies, the combination of a main frame, a vertical spindle pivotally supported by the main frame, a tramway convexly curved toward the vertical spindle, and a ball resting on the tramway, substantially as specified and shown.

2. In an apparatus for illustrating the effect of the central forces on the heavenly bodies, the combination of a pivotally-supported vertical spindle and a radial tramway attached to the said vertical spindle and being convexly curved toward it, substantially as specified and described.



3. In an apparatus for illustrating the effect of central forces, the combination of a vertical pivoted revolving spindle, a radial tramway firmly attached thereto, and a ball free to roll on the said tramway, substantially as specified and described.

388,477. ELECTRICAL CONDUCTOR. William A. Conner, Pittsburg, Pa. Filed Feb. 21, 1888. Serial No. 264,746. (No model.)



Claim.—An electric cable having a central conductor or core and a number of insulated conductors arranged spirally around the central conductor, and each having a cross-section greater in breadth than thickness, and composed of a number of wires, substantially as described.

388,478. CLOTHES-DRIER. George Cox, Reading, Pa. Filed Mar. 30, 1888. Serial No. 268,994. (No model.)

Claim.—The vertical and inclined posts with guideways A^3 and A^4, in combination with the sliding bars having clothes-lines secured thereto, substantially as set forth.

388,479. REEL-STAND AND STOP FOR WIRE-WORKING MACHINES. Louis J. Crecelius, St. Louis, Mo. Filed Nov. 21, 1887. Serial No. 255,809. (No model.)

Claim.—1. In combination with the driving clutch or stop of a wire-machine, a reel mechanism consisting of a supporting-post, an arm swiveled to the post, a reel supported on the arm, and a connection between the arm and clutch or stop, substantially as and for the purpose set forth.

2. In combination with the driving clutch or stop of a barb-wire machine, the reel mechanism consisting of a supporting-post, arms swiveled to the post, reels supported on the arms, and ropes connecting the arms to the clutch or stop, substantially as and for the purpose set forth.

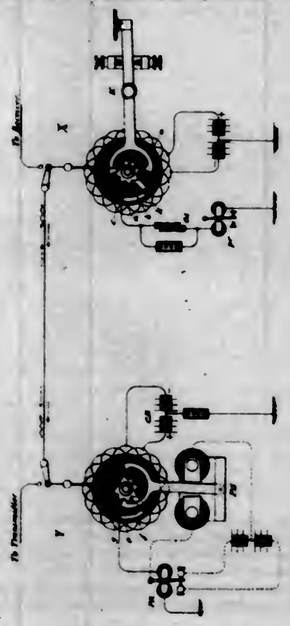
3. In a wire-working machine, the combination, with a driving-clutch, of a feed-reel mechanism consisting of a post, arms swiveled on the post, spindles on the outer ends of said arms, and reels on said spindles consisting of sleeves fitting over the spindles, horizontal arms secured to the spindles, and vertical arms secured to the horizontal arms, and a connection, 25, between the swiveled arm and the driving-clutch, substantially as and for the purpose set forth.

4. In a feed-reel mechanism for wire-machines, the combination of the post, arms swiveled on the post, spindles on the outer end of the arms, sleeves fitting over the spindles, screws in the upper ends of the sleeves, having conical points fitting in conical holes in the upper ends of the spindles, and horizontal arms on the sleeves, substantially as and for the purpose set forth.

5. In a feed-reel mechanism for barb-wire machines, the combination of the post, arms swiveled on the post, spindles on the arms, sleeves fitting over the spindles, horizontal arms secured to the sleeves, vertical arms secured to the horizontal arms, collars 22, fitting over the sleeves, and arms 23 on the collars, substantially as and for the purpose set forth.

388,480. STEP FOR VELOCIPEDES. George H. Day, Hartford, Conn., assignor to the Pope Manufacturing Company, Portland, Me. Filed Dec. 21, 1887. Serial No. 258,593. (No model.)

Claim.—1. An improved adjustable step and attachment, consisting in a spring-loop and extended supporting arms and braces, a bolt and nut, and a shoe-piece resting upon the arms and secured by the bolt.



2. An improved adjustable step and attachment, consisting in a spring-loop and supporting-arms, a bolt and nut, and a shoe-piece resting upon the arms and secured by the bolt, and further secured by a lug and pin-trip between the arms.

3. An improved shoe-piece for a bicycle-step, constructed with a roughened upper surface, a bolt, lug, and a trip part, and side edge rests.

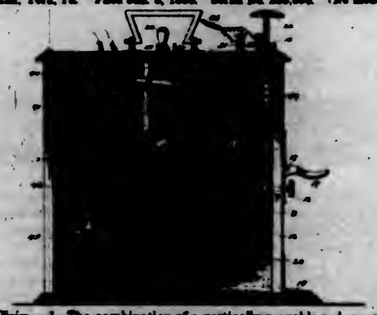
4. An improved adjusting and a supporting device for a velocipede-step, constructed with a spring-loop and extended arms and downward braces, as *b b*, and a bolt and nut.

5. The combination, with a portion of a velocipede-frame, as A, of a step attachment, as B, a shoe-piece, as C, a bolt and nut, as D D', and a pin-trip, as E E C', constructed to operate essentially as set forth.

388,481. TELEGRAPHY. Patrick B. Delany, New York, N. Y. Filed Dec. 3, 1887. Serial No. 256,867. (No model.)

Claim.—1. The combination of a main line, transmitting mechanism for sending alternating currents over the line, a receiving polarized relay; a moving contact-maker connected with the line, its actuating mechanism controlled by the relay, and contacts *e f* respectively connected with sources of energy of opposite polarity, over one of which contacts the trailer passes at each movement of the relay-armature, whereby a counter-current is sent into the line after each received impulse.

2. The combination, with a main line and current-transmitting devices, of a receiver having a receiving-relay, contacts connected with sources of electricity of opposite polarity, and a contact-maker connected with the line and controlled by the relay, which contact-maker successively crosses said contacts as the relay is successively actuated.



3. The combination, with the main line and transmitting devices for sending currents of alternating polarity, of a receiver having a trailer connected with the line, a table of contacts traversed by the trailer, and the alternate contacts *e f* of which are respectively connected with opposite poles of a source of electric energy and the intermediate contacts on which the trailer normally rests connected to earth through the polarized relay, and the trailer-actuating devices controlled by the relay-armature.

4. The combination at a receiving-station of the receiving-relay actuated by impulses received from the distant transmitting-station, the contact-maker, which moves in response to said received impulses, contact-maker-actuating devices controlled by the relay, a line connected with the contact-maker, the contacts *e f*, traversed by the contact-maker, and a source of electric energy with which said contacts are respectively connected and from which counter or neutralizing impulses are sent into said line, as set forth.

5. The combination of a line, a relay located at a receiving-station and responding to impulses received from the distant transmitting-station with which relay the line is normally connected, a contact-maker connected with the line and moving in response to said received impulses, contacts traversed by said contact-maker, the contact-maker-actuating devices controlled by the relay, and a source of electric energy with which said contacts are respectively connected, whereby upon the reception of an electrical impulse upon the relay the line is briefly connected with one of said battery-connected contacts, substantially as set forth.

6. The combination at a receiving-station of a receiving-relay actuating by impulses received from the distant transmitting-station, a contact-maker moving in response to said impulses, contact-maker-actuating devices controlled by the relay, a line connected to the contact-maker, alternate contacts traversed by the contact-maker, and sources of electric energy of opposite polarity with which said alternate contacts are respectively connected, whereby impulses are sent into the line connected to the contact-maker as it passes over each electrically-connected contact.

388,482. DENTAL ELECTRIC APPARATUS. Charles A. Brasham, York, Pa. Filed Jan. 3, 1888. Serial No. 259,696. (No model.)

Claim.—1. The combination of a vertically-movable rod, a spring for normally holding said rod elevated, a lever acted upon by the rod, an induction-coil provided with a regulator controlled by the lever, a circuit-closer in the primary circuit in operative relation to the lever, and a lock for engaging the rod and holding it at any degree of depression.

2. The combination of a sliding rod, an adjustable collar for regulating the degree of thrust of said rod, an induction-coil, and regulating devices therefor controlled by said rod.

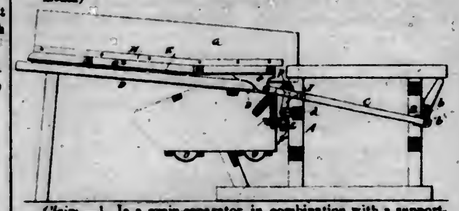
3. The combination of a sliding rod, battery-elements carried thereby and frictionally secured thereto, and a locking device for maintaining the elements in a fixed position, whereby the rod may be reciprocated independently of the elements.

4. The combination of a sliding rod, battery-elements carried by said rod, an electric lamp, circuit-connections between the elements and lamp, a second circuit, a circuit-closer therein actuated by a movement of the rod, an induction-coil in said second circuit, a regulator for the induced current controlled by the rod, and means for locking the rod when shifted.

5. In a dental apparatus, the combination of a battery induction-coil and rheostome, distributing-electrodes outside the instrument in the secondary circuit, a circuit-closer in the primary circuit, a lamp-circuit electric lamp connected therewith by flexible connections, and a circuit-closer for controlling the lamp-circuit.

6. The combination of metallic spring 30, provided with an insulated spot on one face thereof, metallic spring 31, co-operating with spring 30 and normally bearing on the insulated spot, and a push-piece for forcing the springs together, whereby a scraping contact may be made with the metal adjacent to the spot.

7. The combination of a source of electricity, a distributing-electrode in circuit with one pole thereof, a pair of dental forceps, and a clip in circuit with the other pole, said clip being provided with gripping-jaws to engage the handle of the forceps, and means for locking the jaws in engagement with the handle.



8. In a dental electric apparatus, the combination of an electric conductor provided at its terminals with distributing-electrodes adapted to convey the current to a patient to be operated upon, a resistance-coil in circuit with said conductor near one of the terminals to moderate the effect of the current on the part of the body to which the said terminal is applied, and a connector for connecting and disconnecting one of the electrodes to said conductor.

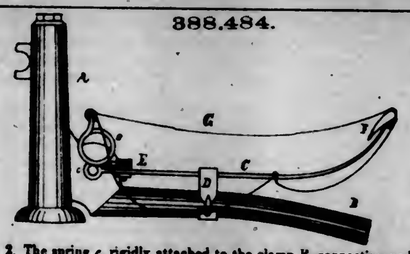
9. In a dental electric apparatus, the combination of a generator of electricity, an electric circuit, a distributing-electrode at one circuit-terminal, a pair of dental forceps at the other circuit-terminal, and an adjustable rheostat in the forceps branch, as and for the purpose set forth.

10. In a dental electric apparatus, the combination of a generator of electricity, an induction-coil, primary and secondary circuits, a distributing-electrode at one secondary terminal, a pair of dental forceps at the other secondary terminal, and an adjustable resistance-coil in the secondary circuit, as and for the purpose set forth.

11. In a dental electric apparatus, the combination of an electric circuit, a distributing-electrode in said circuit for conveying the current to the patient to be operated upon, and a resistance-coil in juxtaposition with said electrode to moderate the effect of the current on the portion of the patient's body to which said electrode is applied, for the purpose set forth.

388,483. GRAIN-SEPARATOR FOR THRASHERS. Joseph T. Fenton, Hopetown, Pa. Filed May 13, 1887. Serial No. 238,069. (No model.)

Claim.—1. In a grain-separator, in combination with a supporting-frame, a shaking screen suspended therefrom, a shaking-shoe suspended from said frame, a pitman connected with said screen and with driving mechanism, and a pivoted rocking lever fulcrumed on the frame, one end of which is loosely connected with the pitman and the other end loosely connected with the said shoe, substantially as and for the purposes described.

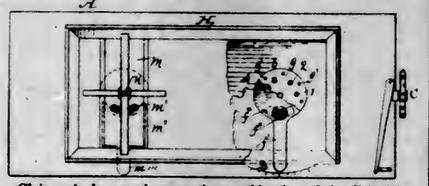


2. In combination with a shaking screen, a pitman provided with a perforated pivot, substantially as shown, a shaking-shoe provided with a perforated pivot, and a lever, J, fulcrumed to the frame and with each of its extremities extending into a perforation in one of said pivots, substantially as described, for the purposes set forth.

3. In combination with a supporting-frame, a shaking screen, E, shaking-shoe M, shaking floor D, connected with said shoe, a pitman, C, connected with the screen and with driving mechanism, and a rocking lever, J, fulcrumed to the frame and having its upper end loosely connected with the pitman and its lower end loosely connected with said shoe, substantially as set forth and described.

388,484. SADDLE FOR VELOCIPEDES. Arthur L. Garford, Elyria, Ohio. Filed Sept. 12, 1887. Serial No. 249,081. (No model.)

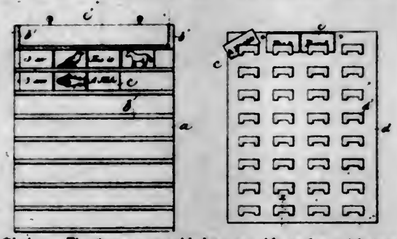
Claim.—1. In a saddle for a bicycle or tricycle, the combination of the movable fulcrum *d*, with the spring C, supported near its middle by said fulcrum, and its front end attached to the front end of the porch or backbone, and rear end to the frame of back end of seat, all as above set forth, and substantially as described.



388,484.

2. The spring *c*, rigidly attached to the clamp E, connecting and in combination with the front ends of the spring C and seat to the saddle, all as above set forth, and substantially as described.

3. The combination of the flat spring C, fulcrum *d*, clamp E, coil-spring *e*, frame F, and cover or seat G, for the purposes above set forth, and all substantially as described.



388,485. BROADCAST SEED-SOWER. THOMAS GREEN, Bancroft, Iowa. Filed Nov. 4, 1887. Serial No. 254,362. (No model.)

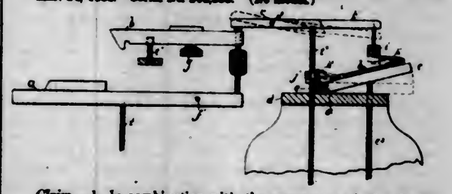
Claim.—1. In a seed-sower, the combination of the disk *f*, having a handle, *f'*, a hole, *f''*, and a pin, *f'''*, and a disk, *g*, having a series of pin-holes, *g'*, and a graduated series of seed-vents, 1 2 3 4, to operate in the manner set forth, for the purpose of regulating the quantity of seed sown and also the throw or cast of the seed.

2. The hopper H, having circular openings in its bottom, and covers *m*, having curved slots *m'* fixed over said circular openings, the disks *f*, having perforations *f''* and pins *f'''*, and the disks *g*, having pin-holes *g'*, and a graduated series of seed-vents, 1 2 3 4, constructed and combined to operate in the manner set forth, for the purpose of regulating the quantity of seed sown and also the throw or cast of the seed.

388,486. EDUCATIONAL APPARATUS. ISAAC F. HALL, Leominster, Mass. Filed Feb. 23, 1888. Serial No. 265,381. (No model.)

Claim.—The frame *a*, provided on one side or face with transverse guides and on its other side with holding-pieces *f*, combined with the card-holder *d*, adapted to be connected with the frame by the said holding-pieces, substantially as described.

388,487. SUSPENDING OVERHEAD ELECTRIC WIRES. ALFRED R. HARRIS, London, England. Filed Mar. 4, 1887. Serial No. 229,731. (No model.) Patented in England Dec. 29, 1886, No. 17,022.



Claim.—The combination, with a series of telegraph or telephone poles for suspending or connecting the line-wire, of a pair of movable bars normally held to place by springs and applied to the opposite sides of the pole near its top, as set forth, and adapted to recede from each other and relieve the strain on the wire under stress of weather, all substantially as set forth.

388,488. FRUIT-JAR. GEORGE H. HARVEY, Pittsburg, Pa., assignor to Albert C. Hills, same place. Filed June 28, 1887. Serial No. 242,857. (No model.)

Claim.—A jar having spiral lugs, a lid having a recess below which is a vent, a gasket having a vent, said gasket being fitted in the recess, and a clamp having a portion of its lower face enlarged, all combined, arranged, and operating with relation to each other substantially as herein described, and for the purpose set forth.

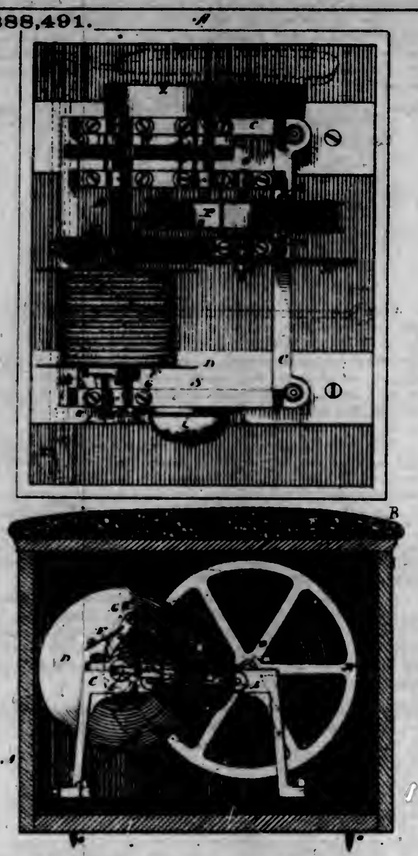
388,489. MANUAL COUPLER FOR ORGANS. JAMES HUEBLER, Chicago, Ill., assignor to The W. W. Kimball Company, same place. Filed Mar. 24, 1888. Serial No. 268,230. (No model.)

Claim.—1. In combination with the upper manual of a double-bank organ and the extended lovers *c'*, fulcrumed at *f*, the regulators *i*, two-armed couplers *h*, and collared tracker-pins i^3, substantially as specified.

2. In combination with the connected upper and lower manuals of a double-bank organ and the extended lovers *c'*, fulcrumed at *f*, the regulators *i*, two-armed couplers *h*, and collared tracker-pins i^3, substantially as specified.

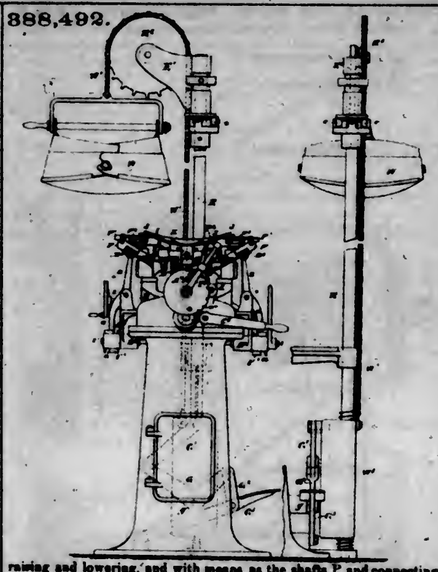
3. In combination with the lower manual of an organ and extended lovers *c'*, fulcrumed at *f* and connected with said manual, the regulators *i*, two-armed couplers *h*, and collared tracker-pins i^3, substantially as specified.

388,490. REED-ORGAN. JAMES HUEBLER, Chicago, Ill., assignor to The W. W. Kimball Company, same place. Filed Mar. 24, 1888. Serial No. 268,236. (No model.)



Claim.—1. In a reed-organ, a thin sounding-board, *a*, provided with a board, *m*, on its inner or under and valve-seat side, deepened-valve air-chamber, and an enlarged wind-chest under said thin board *a* and discharging end, substantially as specified.

2. In a reed-organ, a thin sounding-board, *a*, provided with a board, *m*, on its inner or under and valve-seat side, deepened-valve air-chamber, enlarged wind-chest under said thin board *a*, and discharging end and rigid and enlarged walls *b k l*, substantially as specified.



388,491. FIRE-ESCAPE. LOVI HILL, Muney, Pa. Filed May 8, 1888. Serial No. 273,194. (No model.)

Claim.—The combination of the box A, the frame C, adapted to be secured to the floor of a building, the winding-drum and lowering-cord secured thereto, the drum-shaft E, connected with the drum by ratchet-and-pawl mechanism, the pinion I loose upon the shaft E, but fixed to the winding-drum, the wheel N, geared to the pinion *I* and fixed upon the shaft O, the coiled spring, also secured at one end to the shaft O, a centrifugal governing mechanism upon one end of the frame and geared with the shafts E and O, and an alarm mechanism upon the opposite end of the frame connected by a crank and link with the shaft E, whereby safety lowering may be accomplished and a fire-alarm sounded and the lower cord automatically taken out, all substantially as set forth.

388,491.

388,492.

raising and lowering, and with means, as the shafts F' and connecting-sleeve, and obliquely-grooved bosses F^3 F^4, for moving them apart and together, all arranged for joint operation, substantially as herein specified.

7. In a hat-brim shaper, the shaping-pieces J at the front and back of the brim, each formed in two separate pieces knuckled together, with liberty to shift their centers, as shown, in combination with the cheeks F^5, engaging with the exteriors of the knuckles, as shown, and with the screw F^6, for moving their centers into and out of coincidence, arranged for joint operation, so as to change the contours of the outer edge of the brim by widening or narrowing the quarters, as herein specified.

8. In a hat-brim-shaping apparatus, the sand-pan W, in combination with the pulley E^3, chain W', link G', bell-crank lever G, and means for operating the latter by the foot, so as to raise and depress the sand-pan by a toggle action, as herein specified.

388,493. FEED-TROUGH. JOSEPH M. HUGHES and ARTHUR P. W. WARE, Cedar City, Mo. Filed Apr. 11, 1888. Serial No. 270,333. (No model.)

Claim.—1. The combination of the trough having a cleat, l, secured to one side, the panel arranged over the trough, and the bail pivoted to the panel and adapted to contact with the trough and rest upon the cleat, as set forth.

2. The combination of the trough, the panel arranged over the same, the cross-bars M, pivoted to the panel and resting on the trough, and the bar N, connecting the free ends of said cross-bars, as set forth.

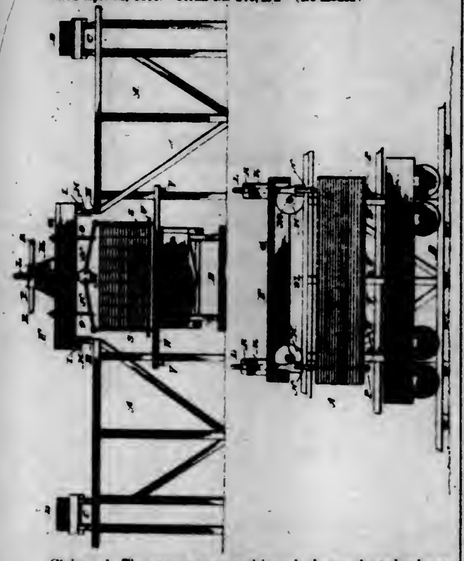
3. The combination of the trough having recesses in its rear edge, the panel arranged over the trough, the cross-bars hinged to the panel and passing through the recess in the trough, and the bar secured to the trough and passing over the cross-bars pivoted to the panel, as set forth.

4. The combination, with the feed-trough, of the oscillating panel arranged over the same, the cover or frame hinged to the panel and composed of a longitudinal bar and a series of cross-bars, and a series of offsets or blocks secured to the panel between the inner ends of the cross-bars, as set forth.

388,492. MACHINE FOR SHAPING HAT-BRIMS. LOUIS H. HOTZ, Danbury, Conn. Filed Feb. 28, 1888. Serial No. 265,604. (No model.)

Claim.—1. In a hat-brim shaper, the detachable and exchangeable head composed of pieces I J K M, capable of sliding one upon another and engaging with the adjustable pieces D^4 of a machine to allow of treating a wide range of sizes and widths of brim, as herein specified.

2. In a hat-brim shaper, the filling-piece O, hook-slides O^2, and holding means O^3, arranged to serve with a detachable head composed of parts overlapping and sliding one upon another, equipped for attaching to suitable mechanism for moving and holding them when not in use, as herein specified.

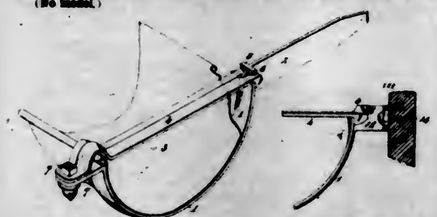


3. In a hat-brim shaper, the levers Z and operating-shaft U, with their right and left grooves *u*, in combination with the parts I J, adapted for varying the conditions simultaneously at the front and rear portions of the brim, substantially as herein specified.

4. In a hat-brim shaper, the side-shaping pieces M, in combination with the levers L^2 and connecting means, as the pinions L' and racks N', arranged to smooth and vary the form of the roll of the brim, as herein specified.

5. In a hat-brim shaper, the parts I J K M, overlapping one upon another, with provisions for varying their position, as specified, and the wheel or segment A^4, having notches, as shown, in combination with each other and with the lever F^8, dog F^9, and with the stop A^5, arranged to prevent the motion from being carried too far, as herein specified.

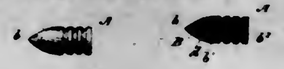
6. In a hat-brim-shaping apparatus, the side pieces, M, each with two wings, M^2, pivoted thereto, with liberty to turn to a limited extent, in combination with means, as the rack N' and pinion L', for



388,494. CAR-LOADER. William H. Jennings, Roberts, Fla. Filed Apr. 12, 1888. Serial No. 270,494. (No model.)

Claim.—1. The apparatus comprising a jack-car adapted to be run on an elevated track above the railroad-track, the elevating-screws depending from the platform of the jack-car, the nuts or hubs engaging said screws, the arms N, connected to the said screws, the links S, pivotally connected to the outer ends of said arms, and the cross-bars U, adapted to connect the lower ends of the said links, substantially as described.

2. The apparatus comprising the jack-car adapted to be run on an elevated track, the hooks O, depending from said car, the elevating-screws L, the nuts or hubs engaging said screws and supported on the jack-car platform, the arms N, pivoted to the lower ends of the elevating-screws, the links S, pivoted to said arms, the latter being adapted to be engaged by the hooks O, and the cross-bars U, adapted to connect the lower ends of the links, substantially as described.



388,495. EAVES-GUTTER HANGER. Moritz Koch, St. Louis, Mo. Filed June 17, 1887. Renewed Feb. 2, 1888. Serial No. 262,825. (No model.)

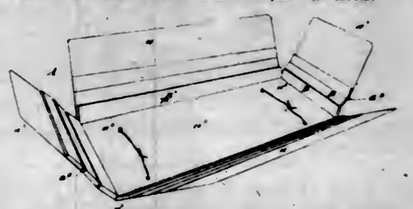
Claim.—1. In an eaves-gutter hanger, the combination of the trough-bed 1, the spike 2, the cross-T attachment 5, with pendent bevel edges 6, under which the heel of the tie-strap 4 engages, said tie-strap having a catch-lug, 8, at its heel and fastened by the screw locking-bolt 9, that couples the tie-strap and trough-bed in front, substantially as described, and for the purpose set forth.

2. In an eaves-gutter hanger, the combination of the trough-bed, its attachment-bracket, the cross-T attachment 5, with its pendent bevel edges, which with the catch-lug on end of the tie-strap lock the heel of said strap and the projecting lugs of the trough-bed and tie-strap that are coupled by the locking-bolt 9, arranged to secure open unbridged troughs in the hanger, substantially as described, and for the purpose set forth.

388,496. BULLET. Frazier P. Lamotte, Pittsburg, Pa. Filed Apr. 7, 1888. Serial No. 269,909. (No model.)

Claim.—A needle-pointed bullet having the steel-pointed core B, with a shoulder or offset, *d*, and a leaden body, the said body extending over the shoulder or offset and covering a portion of the conical end of the core, whereby said core is prevented from coming in contact with the barrel of the fire-arm, substantially as specified.

388,497. ADJUSTABLE BLOCK FOR STRETCHING HATS. John R. McLoughlin, Utica, N. Y. Filed Apr. 10, 1888. Serial No. 270,297. (No model.)



Claim.—1. In an adjustable hat-block, the combination, with a rigid section secured to a platform or table, of a movable section pivoted at its base by means of a horizontal rock-shaft, to which it is rigidly fixed, mounted in bearings upon the table or platform, whereby the upper end of the movable section may be moved inward toward the rigid section for the purpose of contracting the crown of the block, or outward for the purpose of expanding it, substantially as and for the purpose described.

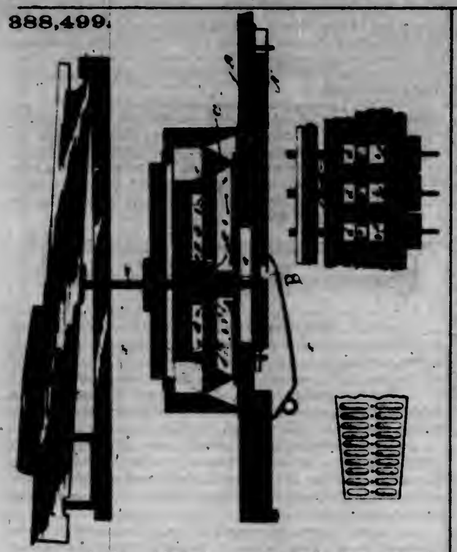
2. In an adjustable hat-block, the combination, with a hollow rigid section secured upon a table or platform and connected with a steam-supply for the purpose of adapting it to receive steam in its interior, of a movable hollow section, also connected with a steam-supply and rigidly secured at its base to a horizontal rock-shaft mounted in bearings upon the table or platform and provided with a lever, whereby it may be oscillated and the crown of the movable section moved toward or away from the fixed section, substantially as and for the purpose described.

3. The combination, in a hat-block, of the fixed section A, secured to a table or platform, the movable section A', secured at its base to a rock-shaft, H, the rock-shaft H, mounted in bearings upon the table or platform, the lever L, for oscillating same, provided with the spur and thumb-screw S, and the curved slotted arm T, secured to the table, substantially as and for the purpose described.

388,498. FILING-CASE. Benjamin H. Morgan, Leavenworth, Kans. Filed Mar. 22, 1888. Serial No. 268,088. (No model.)

Claim.—1. A filing-case having a rigid face portion and side and end folds adapted to overlap upon the said face portion and each other, having longitudinal side and transverse end grooves at the folding-joints, and a re-enforce rigid strip upon the inner sides of said folds parallel in relation to and above said grooves and adapted to overlap in said grooves in unison with said side and end folds upon said face portions, as specified.

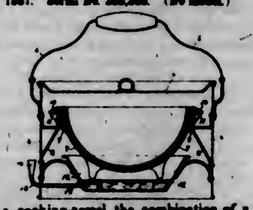
2. A filing-case having a rigid face portion and flexible side and end folds adapted to overlap upon the said face portion and each other, having longitudinal side and transverse end grooves at the folding-joints, and a series of independent rigid re-enforce strips upon the inner sides of said folds parallel in relation to said longitudinal and said transverse grooves, said folds having intermediate grooves between said independent rigid strips, for the purpose described.



388,499. REED-ORGAN. Gustav B. Newman, Chicago, Ill. Filed June 14, 1888. Serial No. 277,062. (No model.)

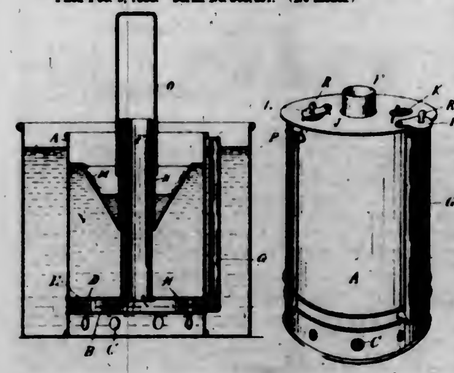
Claim.—1. In a reed-organ, the combination, with the usual cells, of supplemental cells, the usual cells being provided with ports communicating with the supplemental cells at both front and rear of said cells, substantially as described.

2. In a reed-organ, the combination, with the usual cell-board, of a supplemental cell-board having a series of cells closed at their ends and arranged above the cells of the cell-board, the top of the usual cell-board being provided with the front and rear perforations leading into the cells of the supplemental cell-board, substantially as described.



3. In a reed-organ, the combination, with the reeds A^3 and the cell-board B, having cells *b*, and having perforations *b'* and *b''*, of the

388,499.



supplemental cell-board D, having a series of cells, *d*, communicating at their ends with the cells *b* of the usual cell-board B, substantially as described.

388,500. COOKING-VESSEL. Charles J. Parker, Alberton, Md. Filed Nov. 16, 1887. Serial No. 255,393. (No model.)

Claim.—In a cooking-vessel, the combination of a casing the ends of which are open, a cover for the upper end of said casing, a cooking-vessel suspended in the said casing, an evaporating-pan, 12, suspended in said casing and under said cooking-vessel in such position that a space will be formed between the sides of the said evaporating-pan and the inside of said casing, whereby the heated gases from the heat-source and the steam from the evaporating-pan will mingle and impinge on the cooking-vessel, and the tube 13, with its outer end, 14, open and above the level of the water in the evaporating-pan, substantially as shown, and for the purpose set forth.

388,501. CREAMING-CAN. Clarence W. Parks, Moscota, Mich. Filed Feb. 9, 1888. Serial No. 263,491. (No model.)

Claim.—1. In a creaming-can, the combination, with the can, of a false bottom forming an air-chamber near the bottom thereof, a spiral partition secured in that air-chamber to form a circulating-flue, the outer tube communicating with the outer end of said flue, and an inner tube communicating with the inner end of that flue and extending centrally within the can, projecting through the cover thereof, substantially as described.

2. In a creaming-can, the combination, with the can, of a false bottom forming an air-chamber near the bottom thereof, a spiral partition secured in that air-chamber to form a circulating-flue, the outer tube communicating with the outer end of said flue, an inner tube communicating with the inner end of that flue extending centrally within the can and projecting through the cover thereof, and a water-circulating chamber formed below the bottom of the can, substantially as described.

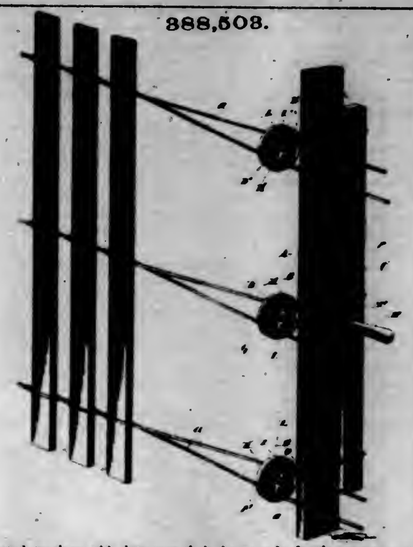
3. In a creaming-can, the combination of the can A, having the extension below its bottom having perforations, of the false bottom D, forming an air-chamber on the bottom of the can, a spiral-flue strip secured in that air-chamber, an outer tube communicating at the periphery with that air-chamber, an inner tube communicating with the center of that air-chamber and rising centrally therefrom through the top of the can, and a tight cover provided with ventilating-apertures having hinged shutters, all combined to operate substantially as described.

388,502. GATE. Jacob W. Parlin, Fancy Prairie, Ill. Filed Apr. 28, 1888. Serial No. 271,783. (No model.)

Claim.—1. The combination, with the gate and supports for the inner end of the gate, of the casting D, having the lateral arms *d*, and having its lower end bent to embrace the lower edge of a rail of the gate, the pivoted catch *h* to bear on the upper edge of the said rail and hold it down, and the supporting-rods E and F, the rod E being adjustably connected with the said arms, substantially as described, for the purpose specified.

2. The combination, with the gate and supports for the inner end of the gate, of the casting D, having the lateral arms *d*, and having the pivoted catch *h* at its upper end, the roller H at the lower end of the casting, the rod F, forming a journal for the said roller H, and having its lower end bifurcated, and the rod E, adjustably connected with the said arms D and with the gate-supports, substantially as described.

3. The combination, with the gate-post and the gate, of the fixed support for the inner end of the gate, the casting having a lateral arm that is provided with a series of openings, the rod F, having the casting pivoted on its upper end, and the rod E, adjustably interposed between the casting and the gate-post, substantially as and for the purpose described.



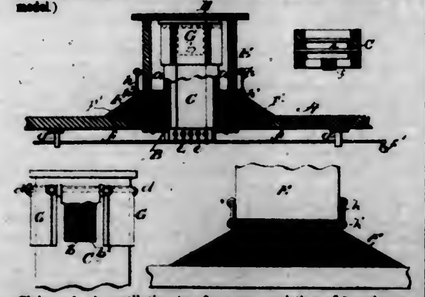
4. The combination, with the gate-post, the gate, and the bolts C and C', of the support *g*, the casting D, having a roller and lateral arms extending in opposite directions, which are provided with a series of openings, and having a pivoted catch, the rod E, adjustably interposed between the casting and the upper bolt, and the rod F, pivotally connected with the casting and having its lower end bifurcated, substantially as described.

5. The combination, with the gate-post, the gate, and the bolts C and C', of the frame G, having the roller *g* swiveled upon the bolt C, the casting D, having the oppositely-disposed arms *d*, which have a series of openings, and having its lower end bent up to embrace a rail of the gate, the roller H, the rod F, having its upper end connected with the casting and forming a support for the roller H, and having its lower end bifurcated and adapted to fit in an opening in the bolt C', the rod E, adjustably interposed between the casting and the bolt C, and the pivoted catch *h*, substantially as and for the purpose described.

388,503. FENCE-MACHINE. William Pieper, Hicksville, Ohio. Filed July 17, 1888. Serial No. 280,280. (No model.)

Claim.—1. The combination, in a fence-machine, of the revolvable twisting heads or disks having the radial open slots, and the locking-plates pivoted on said twisting heads or disks and having the arms

388,503.



adapted to close said slots near their inner ends, for the purpose set forth, substantially as described.

2. The combination, in a feeder-machine, of the revoluble twisting heads or disks having the open slots to receive the fleece-wires, the locking-plates pivoted on said heads or disks and having the right-angled arms at their ends adapted to close the slots near the inner ends thereof for the purpose set forth, and the detent to engage and secure the said locking-plates, substantially as described.

3. The combination of the bar A, the arms or plates B, projecting from one side thereof and having the open slots D E on opposite sides, the revoluble twisting-heads pivoted to the said arms or plate and having the open slots, said head being further provided with the arms O, the operating-bar and the arm projecting from the same and pivotally connected to the arms O, substantially as described.

4. The combination of the arm A, the plates or arms B, secured thereto and projecting from one side thereof and provided with the slots D E, the twisting heads or disks pivoted at the outer ends of said arms or plates and having the radial open slots, the locking-plates K, pivoted to the said piston disks or heads and having the arms L, projecting in opposite directions, for the purpose set forth, the operating-bar P, and means, substantially as described, connecting said operating-bar to the piston heads or disks, whereby the latter may be partly rotated simultaneously, substantially as described.

388,504. VENTILATING CARS. Hiram Pendyer, Washington, D. C., assignor of fifty-one one-hundredths to Joseph P. Collins and James R. Hicks, same place. Filed Dec. 20, 1887. Serial No. 258,235. (No model.)

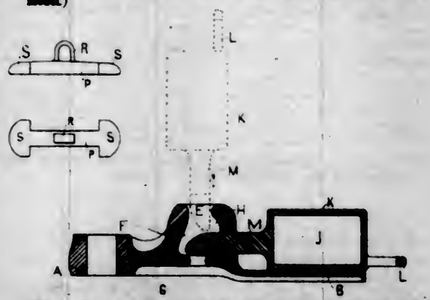
Claim.—1. A ventilating-top for cars, consisting of a casing provided with side openings and secured to the top of a car over an opening in said car, swing-blinds pivoted above said openings, and a cap or hood extending over said casing and projecting downward below said blinds, in combination with the encircling screen F and a series of slats pivoted at the said car-opening and connected to an operating-rod, substantially as set forth.

2. In a car-ventilator, a casing provided with side openings having screens and secured over an opening in the top of the car, vertical swing-blinds hung over said openings, a cap extending over said casing, and a dust-screen connected thereto by hooks and eyebolts, in combination with a series of slats connected to an operating-rod, substantially as shown and specified.

388,505. THERMAL CIRCUIT-CLOSER FOR FIRE-ALARMS. Ramon S. Perez and Ramon S. Rodrigo, Vitoria, Spain. Filed Mar. 26, 1888. Serial No. 268,988. (No model.) Patented in Belgium Mar. 4, 1887, No. 76,973; in France Mar. 9, 1887, No. 182,881; in Luxemburg Mar. 10, 1887, No. 514; in England Mar. 12, 1887, No. 3,702; in Spain Mar. 30, 1887, No. 10,776; in Italy Aug. 30, 1887, No. 20,913, and in Portugal Nov. 3, 1887, No. 1,189.

Claim.—1. The combination, with a body of large mass, of a body of small mass tensioned thereon, said bodies being expansible by heat, and contacts adapted to be brought in operation by loss of tension of said body of small mass upon a sudden rise of temperature.

2. The combination, with a metallic frame, of a metallic wire stretched thereon, and contacts adapted to be brought into operation by loss of tension of said wire upon a sudden rise of temperature.



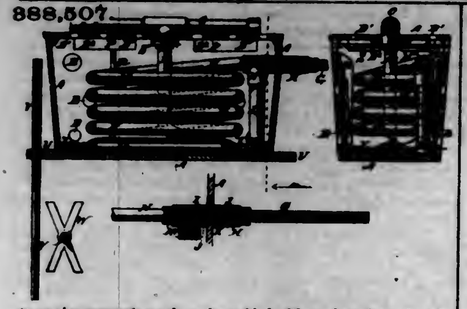
3. The combination, with a metallic frame, of a metallic wire stretched thereon, a stationary contact, a movable contact opposed to said stationary contact, and a spring adapted to press said movable contact onto said stationary contact upon a sudden rise of temperature, said wire holding said contacts apart by its tension.

4. The combination, with a metallic frame, C, of buttons D on the extremities of said frame, a wire, H, stretched around said buttons, contact-plate G, spring F, and contact K, substantially as set forth.

5. The combination of a support, A B B, a metallic frame, C, buttons D thereon, a wire, H, stretched around said buttons, bracket X on said frame, spiral spring F within said bracket, plate G, supported by said spring and insulated, and contact-screw K, supported by said bracket, substantially as set forth.

6. The combination of a base-plate, A, two bars, B, thereon, said bars being perforated and recessed on their opposing faces, a metallic frame, C, supported between said bars, buttons D D on the extremities of said frame, an endless wire, H, stretched around said buttons, a bracket, X, on said frame C, and insulating-plate J, supported by said bracket, a spiral spring, F, supported by frame C, a plate, G, on said spring, pins on said plate G, an adjustable contact-screw, K, on said plate J, and terminals M N in electric connection with said contact-screw J and plate G, respectively, substantially as and for the purpose set forth.

388,506. COUPLING DEVICE FOR STREET-CARS. F. Arthur Pierce, Chicago, Ill. Filed Jan. 9, 1888. Serial No. 260,197. (No model.)

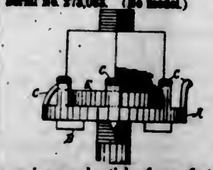


Claim.—In a coupling device for vehicles, the combination of a coupling-piece having an internal cavity with a narrow slot above and a vertical slot in front with a coupler provided with a head to rest in said cavity, a narrow portion, M, adapted to rest in the vertical slot, and an eye on the back of said coupler, whereby it may be elevated into a vertical position, so that its head may be inserted into the narrow slot, as described, and a supporting-plate projecting from said coupling-piece and adapted to support the coupler when the same is in position.

388,507. APPARATUS FOR BURNING HYDROCARBON OIL. George R. Grymes, Boston, Mass. Filed Dec. 27, 1887. Serial No. 259,154. (No model.)

Claim.—1. In an improved apparatus for the combustion of hydrocarbon oils, the following elements: a casing with projecting legs

388,507.

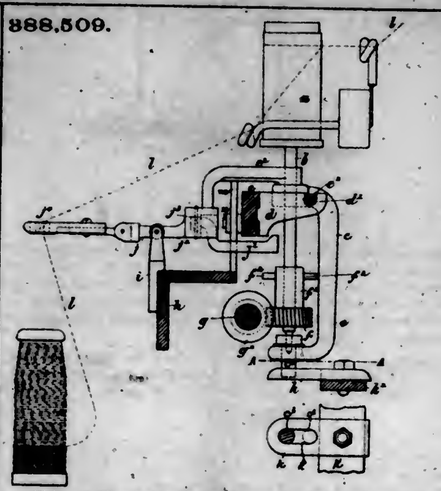


to receive supporting-rods, and provided with graduated openings in the side walls thereof, whose diameters increase from the bottom upward, for the purpose described, an interior convex dispenser integral with the bottom, a foraminous removable top engaging with said casing, a retort of a helicoform character provided at its inlet with an annular chambered coupling suspending a vaporizing-chamber, and further provided at its outlet with terminals diverging at right angles and perforated to emit vapor and to permit ignition of the same, means to uphold said retort, substantially as described, a non-destructible absorbent material surrounding said dispenser to accelerate the heating of said retort, and the threaded vertical rods and supporting-base thereof, in conjunction with said projecting legs, to regulate the position of said apparatus in the fire-pot of the stove or furnace with which it may be employed, all arranged substantially in the manner and for the purpose specified.

2. In an apparatus for burning hydrocarbon oils, the casing A, forming the combustion-chamber, provided with graduated apertures B, for admitting air, and elongated enlarged apertures B^2, contiguous to its top, admitting a preponderance of warmer air, and the convex dispenser Q, integral with the bottom, all arranged and combined to operate in conjunction with the retort N, provided with extended terminals O O, the orifices P P therein for the egress of vapor, the coupling H, connected to said retort, provided interiorly with a feed-duct, J, and exteriorly with a pendent vaporizer, L, and the feed-pipe G, establishing communication from the fuel-supply to said retort, substantially for the purpose and in the manner specified.

3. In an apparatus for the burning of hydrocarbon oils, the combination, with the vaporizer L, the coupling H, provided with an annular space, I, to preserve a low temperature of oil, and adapted to receive the feed-pipe G, provided with a drip-duct, J, the retort N, the perforated terminals O O, thereto connected, and the supporting-bar S, combined to coact with the foraminous casing A, provided integrally with a convex dispenser, Q, apertures B and F, lugs U, and threaded graduating supporting-rods V, and base W, thereto united, substantially as and for the purpose set forth.

388,508. NUT-LOCK. William Sleeper, Jr., Troy, N. Y. Filed May 7, 1888. Serial No. 273,083. (No model.)



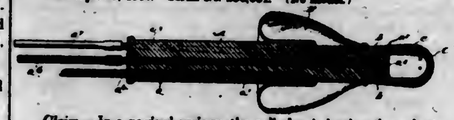
Claim.—1. As an improved article of manufacture, a nut-locking washer made of a single piece of flexible metal, consisting of a plate provided with a central bolt-hole and means for preventing the washer from turning on the bolt, and having a peripheral lug projecting from the nut side of the washer, and on the same side a boss around the bolt-hole raised above the base of the lug, substantially as described.

2. A nut-locking washer composed of an integral malleable casting having a central bolt-hole and means for preventing the washer from turning on the bolt, and provided with a peripheral lug projecting from the nut side of the washer and having the end of the lug thicker than the body part and inclined outward from the center of the washer, substantially as described.

388,509. STOP-MOTION FOR TWISTING-FRAMES, &c. Pierre Smith, Jr., and Smith Ashton, Keighley, County of York, England. Filed Nov. 2, 1887. Serial No. 254,073. (No model.) Patented in England May 19, 1887, No. 7,209.

Brief.—The object of the invention is to provide improved devices for stopping the rotation of the vertical delivery-roller in twisting-frames, &c., upon the breaking of a thread.

388,509.

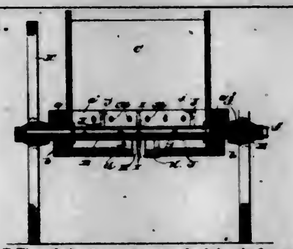


Claim.—1. The combination, in a stop-motion for preventing waste in twisting and other frames, of a swing-frame, *c*, the delivery-roller *a* and its spindle *b*, carried by such frame, pins f^3, gear-pinion *f*, driving-wheel *g'*, supports *d*, and guide *k* for the swing-frame *c*, trigger-lever *m*, and trap-lever *j*, having an eye, j^4, extension j^2, and hinge j^1, all substantially as set forth.

2. The combination, in a stop-motion for waste-prevention in twisting-frames and like apparatus, of a swing-frame, *c*, the delivery-roller, spindle *b*, gear *g'*, driving-gear *f* and its pins or projections f^3, capable of being engaged with or disengaged from said gear *g'*, a trigger-lever, *m*, the placing and displacing of which engages and disengages the gears *f* and *g'*, and a trap-lever, *j*, having an extension, j^2, hinge j^1, and eye j^4, substantially as shown, for the purpose set forth.

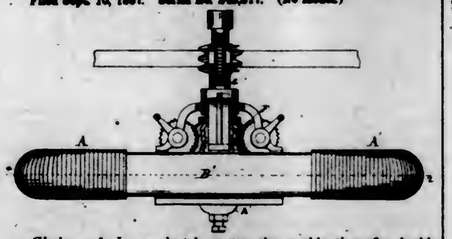
3. In a stop-motion for twisting-frames and like apparatus, the combination, with a balanced trap-lever, *j*, having a hinged end, j^1, of a swing-frame, *c*, having an arm, *c'*, a trigger for supporting said arm, spindle *b*, gear *f*, pins f^3, and delivery-roll *a*, substantially as shown and described.

388,510. VAGINAL SYRINGE. David J. Terrell, Kokomo, Ind. Filed Apr. 25, 1887. Serial No. 236,021. (No model.)



Claim.—In a vaginal syringe, the cylinder A, having three ducts, *a a' a²*, the soft-rubber bag B, surrounding and secured to the cylinder at the upper or front end thereof, said bag being constructed conical in form with the smaller end of the cone facing the front end of the cylinder, whereby the said bag when inflated and inserted beyond the labia forms a tapering wedge or stop-plug to dilate the walls of the vagina and also close or stop up the channel and prevent the fluids from escaping from the vagina, and thus the bag may be held in position without the use of the hand, the duct *a* communicating with the vagina, the tube a^2 connecting with the duct *a* and running to a suitable place of deposit, the nipple C on the front or upper end of the cylinder beyond the bag B, the latter being located at one end only of the cylinder, so as to have the other end thereof projecting from the vagina, which projecting portion forms a convenient hand-hold to withdraw the syringe, the tubes a^4 a^5, connecting with the ducts *a'* a^2, suitable clamps, D, provided on the pipes a^4 a^5 a^6, the bulb W, having the tube w^2 and the pipe *w*, the ends of the tubes a^4 a^5 being detachably connected to the tube w^2 of the syringe, whereby the bulb W may be detached from the pipes a^4 a^5 for the purpose set forth, or when in use the clamp D of air-tube a^4 may be closed, so that the vagina may be supplied with fluid from the bulb W through the tube a^5, or when the clamp of fluid-tube a^5 is closed the bag B may be supplied with air or gas from the bulb W through the air-tube a^4, as set forth.

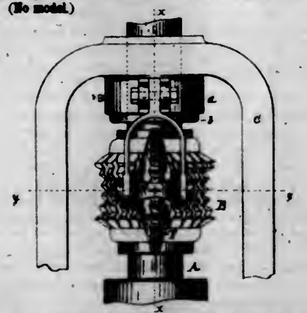
388,511. FERTILIZER-DISTRIBUTER. William W. Terrebone, Hampton, Va. Filed Apr. 9, 1888. Serial No. 270,014. (No model.)



Claim.—In a fertilizer-distributer, the combination, with the hop-

388,511.

per, the wheels F F', and the frame composed of the shafts and cross-beams, of the hollow axle turning in the semicircular blocks *b*, and having the wheel F, fixed on its left end, and the solid journal E, secured in the right end of said axle, and the nut *f*, retaining the wheel F' on said journal, on which the said wheel turns loosely, substantially as specified.



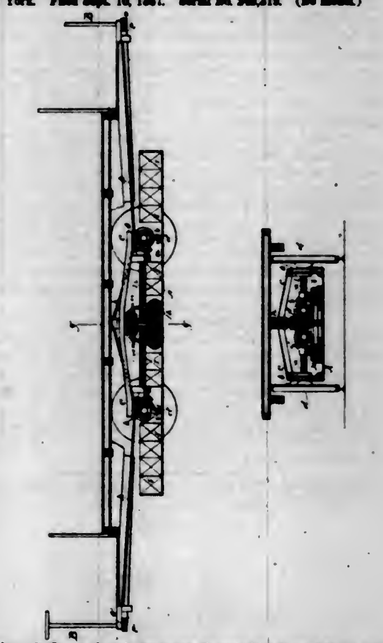
388,512. ELECTRIC MOTOR. JEAN T. VAN GEMERT, New York, N. Y., assignor to the Van Gestel Manufacturing Company, of New York. Filed Sept. 10, 1887. Serial No. 249,317. (No model.)

Claim.—1. In an electric motor, the combination of a double field-magnet composed of two semicircular electro-magnets, A A', whose like poles are respectively joined to two pole-pieces, B B', formed to substantially continue the lines of the magnetic circuit, and having semicircular channels *c c* in their faces, which admit and embrace the disk-armature, with the armature D, having hollow radial arms *d d*, and a core composed of two thin bands of iron corrugated in opposite directions, as herein described.

2. In an electric motor, the combination of the double electro-magnets A A' and pole-pieces B B' with the disk-armature D, rotating in the same plane as the field-magnet, and having a core composed of two strips of thin iron, *m* and *n*, one corrugated longitudinally and the other transversely, which are coiled together spirally upon the hollow arms *d d*, as set forth.

388,513. COMMUTATOR FOR DYNAMO-ELECTRIC MACHINES. JEAN T. VAN GEMERT, New York, N. Y., assignor to the Van Gestel Manufacturing Company, of New York. Filed Sept. 10, 1887. Serial No. 249,318. (No model.)

Claim.—1. A collector or commutator for dynamo-electric machines or electric motors, consisting of a worm-gear placed upon the armature-shaft of the machine, the face of the gear being composed of bars of copper or other suitable material mutually insulated and placed parallel with the shaft, the same being connected severally with the different coils of the armature, and two collector-wheels of similar conductive material having teeth which correspond and mesh with the thread of the worm placed on diametrically-opposite sides of the worm, and having their axes at right angles with the worm-shaft, the said wheels being connected with the two extremities of the external electric circuit.



2. In a dynamo-electric machine or electric motor, the combination of a bar-commutator whose face is constructed in the form of a worm-gear, with two collector-wheels having teeth around their peripheries formed to mesh with the worm-commutator, the said collector-wheels being adjustably attached to the frame of the machine on opposite sides of the commutator and being insulated from said frame, but electrically connected with the two extremities of the external electric circuit.

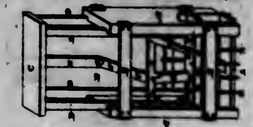
3. In a dynamo-electric machine or electric motor, the combination of the commutator B, situated upon the armature-shaft and having its face in the form of a screw-gear, with the collector-wheels F F' gearing therewith, and the arms E E' supporting said wheels, as above described.

4. The combination of a bar-commutator, B, having a screw-thread cut about its face, and the collector-wheels F and F', which have teeth around their faces which mesh with the thread upon the commutator, with the hinged supporting-arms E E', the ring *a*, and hub *b*, as herein set forth.

5. In a dynamo-electric machine or motor, the combination of the worm-shaped commutator B and the collector-wheels F F', gearing therewith, with the frame *d*, insulators *c*, hinged arms E E', springs K, ring *a*, and hub *b*, all as above described and set forth.

388,514. ELECTRIC TRAM-CAR. JEAN T. VAN GEMERT, New York, N. Y., assignor to the Van Gestel Manufacturing Company, of New York. Filed Sept. 10, 1887. Serial No. 249,319. (No model.)

Claim.—1. In an electric tram-car, the combination of the truck of the car with a platform detachably suspended from the axles, an electric motor and electric batteries mounted upon said platform, and suitable gearing connecting the motor with the axles of the car, as herein described.



2. In an electric tram-car, the combination of the platform or box A, motor M, shafts *m* and *n*, gears *m' m'' n' n''*, clutches H H', and rod *h*, with the axles of the car and wheels of the car, as described.

3. In an electric tram-car, the combination of the axles *a a*, and the box or platform A, removably attached thereto, with the motor M, suitable gearing connecting the motor with the axles, and the frame *c*, supporting said gearing, all arranged as and for the purpose set forth.

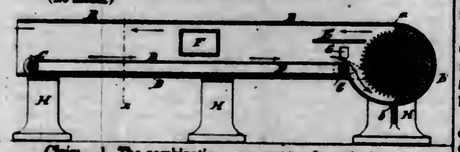
4. In an electric tram-car, the combination of the truck of the car and the platform A, attached to the axles thereof, and the batteries S and motor M, mounted upon said platform, with the gear-wheels *m' m'' n' n''* upon the axles *a a* of the truck, and the clutches H H', operated by the rod *h* from the platform of the car by means of the hand-wheel B and pinion *o*, and rack *p*, to connect said gear-wheel with either axle, in the manner described.

5. In an electric tram-car, the combination of the axles of the car *a a* with the bearings *h*, links or hooks *i i*, platform A, and motor M, geared to said axles, as and for the purpose set forth.

388,515. MOLE AND GOPHER TRAP. CHARLES VAN WORMER, Auburn, Ind. Filed June 6, 1887. Serial No. 240,503. (No model.)

Claim.—The combination of the frame A, provided with a cross-piece, H, the vertically-movable and weighted frame C D, provided with spikes at its lower end and placed inside of the one A, the hanger E, secured at its upper end to the frame, the toggle-levers F G loosely fastened to the hanger E at one end and to the stationary cross-piece H of the frame A at the other, the latch I, pivoted to the frame A at one end and made to catch over a pin on the levers, the connecting-rod K, fastened to the latch I at one end, and the tripping device fastened to the lower end of the rod K, substantially as shown.

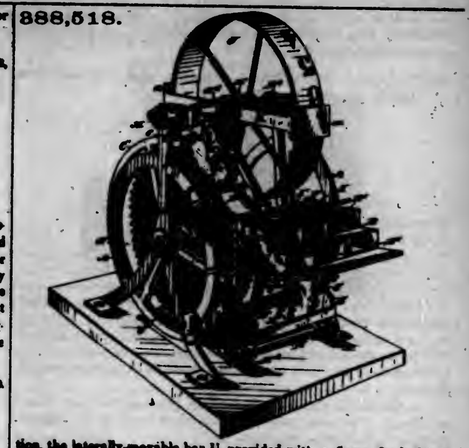
388,516. HOVE-TRUCK. ROBERT G. WEBER, Dayton, Ohio. Filed May 3, 1888. Serial No. 272,888. (No model.)



Claim.—1. In an elevating-truck, the combination of the frame B, mounted on casters, the platform A, pivoted supporting-blocks C C, brace D, to engage notches in the under rails, and detachable lever G, to engage the staple *s* of the forward supporting-block, substantially as set forth.

2. The lever G, having notch *t*, in arrangement with the pivotal block C, provided with staple *s* to engage said lever, substantially as and for the purposes specified.

3. The supporting-plate E, with orifice to embrace the rail of the frame B, and an orifice, *o*, for the pivot of a caster, substantially as set forth.



388,517. MACHINE FOR REDUCING FEATHERS. CESAR WOLFF, Frankfort-on-the-Main, Germany. Filed Sept. 3, 1887. Serial No. 248,703. (No model.)

Claim.—1. The combination, in a machine for stripping feathers, of a rotary toothed picking and blowing drum, a stationary casing, within which said drum works and which is furnished with an internal toothed concave, an endless apron arranged to move toward said drum, and a trunk which forms a prolongation of said casing and in which there is an opening above the apron, but distant from the drum, for the introduction of the feathers, substantially as herein described.

2. The combination, with the rotary toothed drum A and the endless apron C, of the casing B, containing said drum and apron, and furnished with a toothed concave, *a b*, confronting to said drum, and provided with the openings F G and partition E, substantially as herein described, and for the purpose set forth.

388,518. INDICATING AND CALCULATING MACHINE. PHILIP TOY, Dayton, Ohio. Filed Dec. 13, 1886. Serial No. 220,911. (Model.)

Claim.—1. The combination of the pivoted key-frame B with a key, B', pivoted thereto, a supplemental frame, F, pivoted to frame B and arranged to be rocked by said key, an arm on said supplemental frame, a fixed plate engaged by said arm to lock said frames B F until said key moves said arm out of the way of said plate by rocking the frame F, a wheel bearing numerals on its periphery, and intermediate devices whereby said wheel is operated by said frame, substantially as set forth.

2. The combination of the shields *m*, bar K, and rod L with the pivoted frame E, the key and key-frame whereby frame E receives motion, the laterally-movible bar U, provided with a flange for locking said key-frame, and the obliquely-beveled pin 1, carried by said key-frame and arranged to come in contact with a similar bevel on the bar U as the key-frame descends, for the purpose set forth.

3. The pivoted frame E, provided with a shoulder, E', in combination with a peripherally-toothed wheel, C, engaged and locked by said shoulder, a key-frame and key arranged to rock said frame E for effecting said locking, and a peripherally-graduated attachment of said toothed wheel, whereby it becomes an indicating or computation wheel, substantially as set forth.

4. In combination with a key and key-frame, a segment moving with said frame, a pinion and indicator-wheel driven by said segment, a locking device for said key-frame relieved by said key, a computation-wheel provided with teeth for step-by-step forward motion, and a pawl attached to said key-frame for driving said teeth, substantially as set forth.

5. A key and key-frame, in combination with an indicator-wheel, J, intervening gearing whereby said wheel is turned forward or backward as said key-frame vibrates downward or upward, shields *m*, for covering the numbers on said wheel, a pivoted frame, E, operated by said key and key-frame, a pivoted bar which carries said shields, and a rod connecting said bar to said lower frame, in order that the depression of the key and key-frame may move the indicator-wheel on its axis a certain distance and then uncover the numeral thus presented by its periphery, substantially as set forth.

6. In combination with a key and key-frame, a pawl carried by said key-frame, a toothed wheel moved step by step by said pawl, a graduated spiral carried by said wheel, a toothed indicator-plate engaged and turned by said spiral, and a spring-catch which allows said plate to be turned back to zero at will, substantially as set forth.

7. A vibratory key-frame and a spring-pressed pawl which is carried thereby and adapted to be withdrawn by hand, in combination with a toothed computation-wheel which is driven by said key-frame and pawl, an additional graduated wheel, J, and intervening devices whereby the latter wheel is operated by said key-frame, the said pawl serving to lock the key-frame against upward motion by its engagement with the teeth of said computation-wheel, substantially as set forth.

8. An indicator-wheel having two reverse sets of numerals on its periphery, in combination with a pivoted bar, shields on said bar for simultaneously covering or uncovering the same numerals at front and back, and mechanism for turning said wheel and rocking said bar, substantially as set forth.

388,519. FINGER-SHIELD. ARTHUR ARMSTRONG, Ishpeming, Mich. Filed Apr. 2, 1888. Serial No. 269,254. (No model.)

Claim.—1. A finger-shield formed of a curved strip of metal adapted to receive the end of the finger, and a leather contact-surface carried by the said metallic strip, substantially as specified.

2. In a finger-shield for players of stringed instruments, the combination of the curved strip A, the leather covering B, and a coating of Venice turpentine and pitch applied to the leather covering, substantially as specified.

388,518.

tion, the laterally-movible bar U, provided with a flange for locking said key-frame, and the obliquely-beveled pin 1, carried by said key-frame and arranged to come in contact with a similar bevel on the bar U as the key-frame descends, for the purpose set forth.

3. The pivoted frame E, provided with a shoulder, E', in combination with a peripherally-toothed wheel, C, engaged and locked by said shoulder, a key-frame and key arranged to rock said frame E for effecting said locking, and a peripherally-graduated attachment of said toothed wheel, whereby it becomes an indicating or computation wheel, substantially as set forth.

4. In combination with a key and key-frame, a segment moving with said frame, a pinion and indicator-wheel driven by said segment, a locking device for said key-frame relieved by said key, a computation-wheel provided with teeth for step-by-step forward motion, and a pawl attached to said key-frame for driving said teeth, substantially as set forth.

5. A key and key-frame, in combination with an indicator-wheel, J, intervening gearing whereby said wheel is turned forward or backward as said key-frame vibrates downward or upward, shields *m*, for covering the numbers on said wheel, a pivoted frame, E, operated by said key and key-frame, a pivoted bar which carries said shields, and a rod connecting said bar to said lower frame, in order that the depression of the key and key-frame may move the indicator-wheel on its axis a certain distance and then uncover the numeral thus presented by its periphery, substantially as set forth.

6. In combination with a key and key-frame, a pawl carried by said key-frame, a toothed wheel moved step by step by said pawl, a graduated spiral carried by said wheel, a toothed indicator-plate engaged and turned by said spiral, and a spring-catch which allows said plate to be turned back to zero at will, substantially as set forth.

7. A vibratory key-frame and a spring-pressed pawl which is carried thereby and adapted to be withdrawn by hand, in combination with a toothed computation-wheel which is driven by said key-frame and pawl, an additional graduated wheel, J, and intervening devices whereby the latter wheel is operated by said key-frame, the said pawl serving to lock the key-frame against upward motion by its engagement with the teeth of said computation-wheel, substantially as set forth.

8. An indicator-wheel having two reverse sets of numerals on its periphery, in combination with a pivoted bar, shields on said bar for simultaneously covering or uncovering the same numerals at front and back, and mechanism for turning said wheel and rocking said bar, substantially as set forth.

3. As an improved article of manufacture, a finger shield formed of a curved metallic strip and a leather covering inclosing its central portion, substantially as specified.

888,520. FEED-TROUGH. William Ansems, Rockburg, Wis. Filed Jan. 27, 1888. Serial No. 262,100. (Model.)

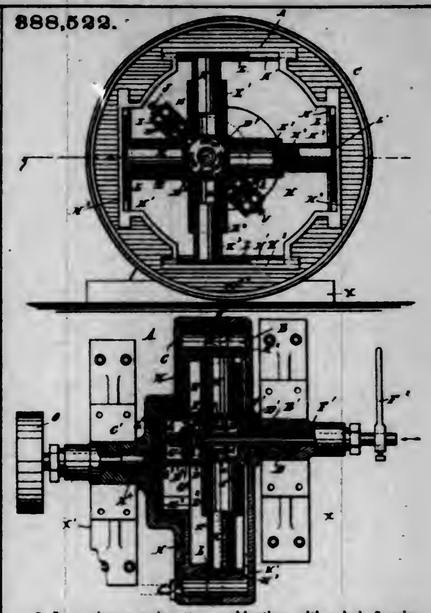
Claim.—1. A feed and drinking trough comprising a trough divided into two compartments, a hopper supported in one compartment and extending to within a short distance of the bottom thereof, and an open-bottom box hinged at one side of the other compartment and provided with a door in its top, substantially as herein shown and described.

2. The combination, with a trough, of an open-bottom box hinged at one side of the trough and provided with a door in its top, substantially as herein shown and described.

3. In a feed and water trough, the combination, with the standards B^2 and A^2, the bottom A, and sides B E, of a box, F, having an open bottom hinged to one side piece extending horizontally above the bottom and nearly to the opposite side, a partition, d^2, longitudinally dividing said box, and a door, c, located in the top thereof, substantially as shown and described.

4. In a feed and water trough, the combination, with the standards B^2 and A^2, the bottom A, and outwardly-inclined sides B E', of a box, F, having an open bottom, and inclined front and hinged to one side piece extending horizontally above the bottom and nearly to the opposite side, a door, c, located in the top of the box, and means, substantially as shown and described, for securing the box in a horizontal position, as and for the purpose set forth.

888,521. THILL-COUPLING. Omar P. Barker, Peoria, Ill. Filed May 28, 1888. Serial No. 274,668. (No model.)



Claim.—1. A thill-coupling or horse-detacher comprising the thill-irons E, having heads *g*, stationary jaws B, the clips *a*, securing said jaws to the axle and provided with eyes *m*, the jaws C, pivoted to the fixed jaws and having operating-springs, the guide-eyes *n n* at or near the center of the axle, and cord or chain F, passed down through openings in the vehicle-body, through the eyes *n* and clip-eyes *m*, and secured to the pivoted jaws, the said cord or chain having knots or stops above the opening in the vehicle-body, substantially as set forth.

2. A vehicle-coupling or horse-detacher comprising the thill-irons E, having heads *g*, stationary jaws B, clips *a*, securing said jaws to the axle and provided with eyes *m*, the jaws C, pivoted to the fixed jaws and having operating-springs, the guide-eyes *n* and *n* at or near the center of the axle, a cord or chain, F, passing downward through openings in the vehicle-body, through the eyes *n* and the clip-eyes *m*, and secured to the pivoted jaws, the said cord or chain having knots or stops above the openings in the vehicle-bottom, a set-screw passing through the outer end of the upper jaw in contact with the inner face of the lower jaw, and a locking-block pivotally attached to said set-screw, all combined to operate substantially as and for the purpose specified.

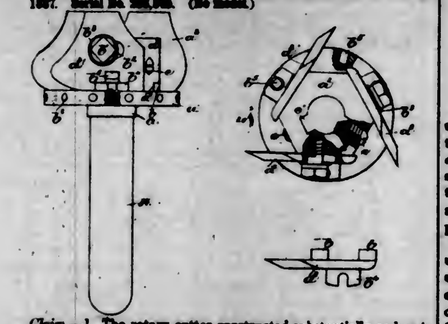
888,522. ROTARY ENGINE. Joseph R. Bradshaw, Sarel, Ontario, Canada. Filed Feb. 13, 1888. Serial No. 264,671. (No model.)

Claim.—1. In a rotary engine, the combination, with a hub forming a valve-seat having ports and an exhaust-chamber, of a valve held on the said seat and operating over the said ports, a series of cylinders secured radially on the said hub and into which lead the said ports, pistons having central openings operating in the said cylinders, and a wheel held eccentrically to the said hub, and on the rim of which the said pistons operate, substantially as shown and described.

888,522.

2. In a rotary engine, the combination, with a hub forming a valve-seat having ports and an exhaust-chamber, of a fixed valve held on the said seat and operating over the said ports, cylinders secured radially on the said hub and into which lead the said ports, pistons operating in the said cylinders, a plate secured to the outer end of each piston, and a wheel provided with slots in which operate said plates, said wheel being held eccentrically to the said hub, substantially as shown and described.

3. In a rotary engine, the combination, with a hub forming a valve-seat having ports and an exhaust-chamber, of a fixed valve held on the said seat and operating over the said ports in the valve-seat, cylinders secured radially on the said hub and into which lead said ports, pistons operating in the said cylinders, plates secured to the outer ends of said pistons, a wheel provided with slots in which said plates travel, said wheel being held eccentrically to the said hub, and a casing made in two parts, forming bearings for the said hub and the said wheel, and also serving as an exhaust-chest connected with the said exhaust-chamber, substantially as shown and described.



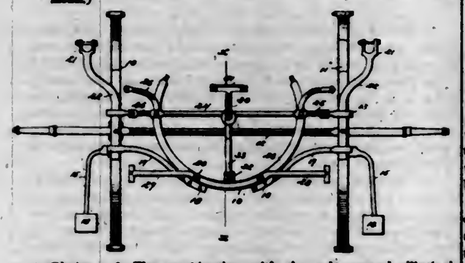
4. In a rotary engine, the combination, with a hub forming a valve-seat having ports and an exhaust-chamber, of an inlet-valve held on the said valve-seat and provided with an inlet-port and an outlet-port operating over the said ports in the valve-seat, an inlet-pipe supporting said valve, an offset formed on the said valve and provided with radial openings connected with the said pipe, a governor-valve consisting of a cap held to slide on the said offset over the said openings and an annular inclined flange secured to the said cap, and weighted slides having inclined slots engaging the said annular flange of the governor-valve, so as to move the latter forward or backward in its bearings to open and close the said openings in the valve, substantially as shown and described.

5. In a rotary engine, the combination, with a hub having a valve-seat and having a rotary motion, of a valve held on the said valve-seat and operating on the ports of the said valve-seat; an inlet-pipe carrying said valve and discharging into openings formed in an offset on the said valve, a cap held to slide on the said offset to open and close the openings in said offset, an annular inclined flange formed on the said cap, weighted slides having inclined slots engaging the said inclined flange, said weighted slides being mounted to slide radially on the said hub, and springs pressing against said weighted slides, substantially as shown and described.

6. In a rotary engine, the combination, with a hub having a valve-seat and having a rotary motion, of a valve held on the said valve-seat and operating on the ports of the said valve-seat, an inlet-pipe carrying said valve and discharging into openings formed in an offset on the said valve, a cap held to slide on the said offset to open and close said openings in it, an annular inclined flange formed on the said cap, weighted slides having inclined slots engaging the said inclined flange, said weighted slides being mounted to slide radially in the said hub,

springs pressing against the said weighted slides, and set-screws for regulating the tension of the said springs, substantially as shown and described.

888,523. ROTARY CUTTER. Charles H. Benjamin, Boston, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed Oct. 31, 1887. Serial No. 253,903. (No model.)



Claim.—1. The rotary cutter constructed substantially as herein described, it comprising a disk or plate, a cutter-head, and a knife secured to both the said disk or plate and cutter-head and capable of adjustment by movement of either the said disk or cutter-head, the one with relation to the other, substantially as described.

2. In a rotary cutter constructed substantially as herein described, the combination, with a shaft, of a disk or plate loosely mounted thereon, a cutter-head, and a knife secured to both the said cutter-head and disk or plate and capable of adjustment by movement of the said disk or cutter-head, the one with relation to the other, substantially as described.

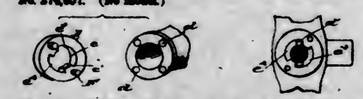
3. A rotary cutter comprising a disk or plate, *c'*, a cutter-head provided with a rabbet to form a groove with the said plate or disk, and a knife secured to the said disk or plate and having lugs to enter the said groove, substantially as described.

888,524. RUNNING-GEAR FOR VEHICLES. Adam Bone, Murfreesborough, Tenn. Filed May 31, 1888. Serial No. 275,612. (No model.)

Claim.—1. The combination, with the axle, spaced elliptical springs clipped upon the same, a cross-bar uniting the springs, and thill-irons projected from said cross-bar, of a fifth-wheel having the lower section attached to the said cross-bar, a second short cross-bar secured to the upper section of the wheel, a king-pin passing through said cross-bars, and arms radiating from the upper cross-bar and the upper section of the wheel, substantially as shown and described.

2. The combination, with the axle, spaced elliptical springs clipped upon the same, a main cross-bar uniting the springs, and thill-irons projected from said cross-bar, of a fifth-wheel having the lower section attached to the said cross-bar, a second short cross-bar secured to the upper section of the wheel, a king-bolt passing through said cross-bars, a bifurcated guide-rod pivoted upon the king-bolt and attached to the upper wheel-section, and arms radiating from the short cross-bar, the king-bolt, and wheels, substantially as and for the purpose specified.

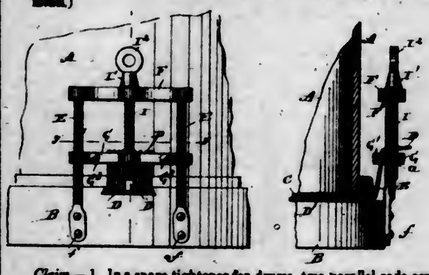
3. The combination, with the axle, spaced elliptical springs clipped upon the same, a main cross-bar uniting the springs, thill-irons projected forwardly from said cross-bar, and step-carrying bars projected rearwardly therefrom, of a fifth-wheel having the lower section attached to said cross-bar, a second short cross-bar secured to the upper wheel-section, a king-bolt passing through said cross-bars, a bifurcated guide-arm pivoted upon the said king-bolt and attached to the upper wheel-section, braces connecting the wheel and springs, and supporting-arms radiating from the short cross-bar, the king-bolt, and wheel, substantially as shown and described.



888,525. STOPPER FOR BOTTLES. William A. Bell, Philadelphia, Pa. Filed May 1, 1888. Serial No. 272,473. (No model.)

Claim.—1. In a bottle-stopper, the cork A, the screw-threaded casing *b*, the tube B, the nozzles C C', the thumb-screw D, fitted through the adjustable cap *p* and having secured on the end thereof the cork *c*, and the vent-plug *c*, in combination with the adjustable sleeve F, a screw-thread provided on the interior of the sleeve F, adjustable on the screw-thread of the casing *b*, the legs *h*, fastened to the sleeve F, and hooks *i* on the extremity of legs *h*, in the manner and for the purposes hereinbefore substantially set forth and described.

2. A bottle-stopper having a metal casing around the name or the upper part thereof, said casing provided with screw-threads, a tube extending longitudinally through the stopper, connected at its upper end with two nozzles and provided with a thumb-screw having a cork of rubber or other suitable material secured on the lower end thereof for the purpose of drawing or stopping the flow of the liquid passing down about midway between the two nozzles to the point of connection between the main tube or orifice with the two nozzles, the mouth of one of the nozzles provided with a vent regulated by a thumb-screw to admit air or not, as desired, the mouth of the other nozzle being open, in combination with an adjustable sleeve provided with screw-threads on the interior thereof, fitted or to be fitted on the screw-thread around the stopper, said sleeve being provided with fasteners having hook projections at their extremities adapted to catch under the rim of the neck of the bottle.



888,526. RIGHT AND LEFT HAND STOP AND WASTE FAUCET. William Bemis, Brooklyn, N. Y. Filed May 23, 1888. Serial No. 274,607. (No model.)

Claim.—1. The combination, with the faucet-casing having two sets of pin-receiving apertures approximately at right angles to each other in one end surrounding the key-bore, and the key extending through said bore and having transverse projections on its projecting end, of an adjustable ring-washer having pins registering with either set of said apertures, according to the position desired, and provided with internal lugs between and against which said transverse projections play, and the nut on the key holding the washer on the casing, whereby by changing the position of said ring-washer the faucet may be changed from a right to a left hand faucet, substantially as set forth.

2. The combination, with the faucet-casing having an annular recess in one end around its bore and two sets of pin-receiving apertures approximately at right angles to each other in the inner wall of said recess, and the key extending through the bore and having opposite transverse projections on the projecting end at said annular recess, and an adjustable ring-washer fitting in said annular recess and having pins registering with either set of said apertures, and internal lugs between which said key projections play, and the nut screwed on the end of the key over the washer and closing it, substantially as set forth.

888,527. SNARE-TIGHTENER FOR DRUMS. John H. Bouker, Jr., New York, N. Y. Filed July 10, 1888. Serial No. 279,236. (No model.)

Claim.—1. In a snare-tightener for drums, two parallel rods connected at one end by a cross-bar having an opening, two connected

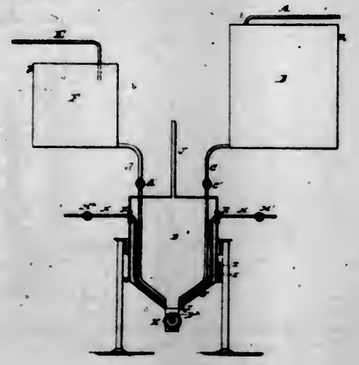
jaws, one of which is provided with a screw-threaded opening, and a screw-threaded rod in engagement with the openings in the cross-bar and jaw aforesaid, substantially as shown and described.

2. In a snare-tightener for drums, two parallel rods connected at one end by a cross-bar having a smooth opening, two connected jaws, one of which is provided with a screw-threaded opening and also provided on each end with a smooth opening, and a screw-threaded rod in engagement with the smooth opening in the cross-bar and in the screw-threaded opening in the jaw, the said parallel rods being engaged with the openings in the respective ends of the jaw aforesaid, substantially as shown and described.

3. In a snare-tightener for drums, two parallel rods connected at one end by a cross-bar having a smooth opening, two connected jaws, one of which is provided with a screw-threaded opening and a smooth opening in each end, a screw-threaded rod in engagement with the opening in the cross-bar and with the screw-threaded opening in the jaw aforesaid, the face of one of the jaws being serrated or roughened, the parts being connected substantially as shown and described.

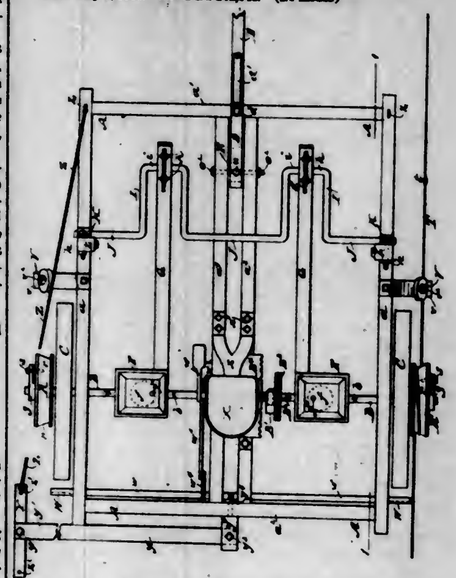
4. In a snare-tightener for drums, the rods E E and connecting-cross-bar F, said bar being provided with an opening, in combination with the jaws G G', the jaw G being provided with smooth end openings which engage, respectively, the rods E, said jaws being provided with openings in alignment, which are engaged, respectively, by the screws G^2, the jaw G being provided with an opening in alignment with the opening in the cross-bar F, and the shouldered and screw-threaded rod I in engagement with the openings in the jaw and cross-bar aforesaid, substantially as shown and described.

388,528. WAGON-BODY. Felix Burgess, Darlington, Wis. Filed Feb. 17, 1888. Serial No. 264,346. (No model.)



Claim.—1. In a wagon-body, the combination, with bottom boards, of interlocking transverse connecting-bars secured to the under side of the bottom and provided with pivoted buttons, substantially as and for the purpose described.

2. In a wagon-body, the combination, with bottom boards having their contiguous edges tongued and grooved, interlocking transverse connecting-bars secured to the under side of the bottom, forming a lap-joint, and a pivoted button upon the connecting-bars, adapted to cover the joint of said bars, right-angular brace-bars attached to the sides and embracing the bottom, and means for securing said bars to the bottom, substantially as and for the purpose specified.



3. In a wagon-body, the combination, with bottom boards having their contiguous edges tongued and grooved, of the transverse connecting-bars d' d^3, secured to the respective bottom boards, and constructed with rabbeted ends to form a lap-joint, d^4, the pivoted buttons E E, secured upon said bars and spanning the joints at one side of the joint between the aforesaid bottom boards, the right-angular brace-bars E' E', attached to the sides and embracing the bottom, and set-screws h h, passing through their horizontal arms into contact with the bottom, substantially as described, whereby when said buttons are placed at right angles to the length of connecting-bars each half of the body composed of the posts above specified may be raised from the framing, in the manner hereinbefore described.

388,529. PROCESS OF OBTAINING CREOSOTE, &c. Franklin S. Clark, Charleston, S. C. Filed Apr. 27, 1887. Serial No. 236,209. (No model.)

Claim.—The process herein described, which consists in mingling caustic-soda solution containing creosote or analogous phenoloid bodies with pyroligneous acid, thereby occasioning a reaction between the mingled bodies, and depositing creosote, and forming acetate of soda by the union of the soda solution and the acetic acid of the pyroligneous-acid solution, substantially as described.

388,530. CHECK-ROW PLANTER. John Clark, Sheffield, Iowa. Filed May 5, 1888. Serial No. 272,941. (No model.)

Claim.—1. The combination, in a check-row planter, of a frame or sulky, a cranked axle or shaft journaled thereon, one or more planting-prods hung to said shaft, an oscillatory cranked shaft journaled on the frame, and a sway bar or bars connected to the prod or prods and hung on the crank-wrists of the oscillatory shaft, substantially as shown and described, whereby as the prod-shaft is rotated the prod or prods will be reciprocated vertically to enter and leave the ground, and will also be inclined toward the front and rear to avoid dragging in the soil, as set forth.

2. The combination, in a check-row planter, of a frame or sulky, a cranked axle or shaft journaled thereon, one or more planting-prods hung to the shaft, an oscillatory cranked shaft journaled in boxes vertically adjustable on the frame, and a sway bar or bars connected at one end to the prod or prods and hung at their other ends in boxes adjustable on the sway-bars toward and from the prod or prods and fitting the wrists of the oscillatory shaft-cranks, substantially as shown and described, whereby as the prod-shaft is rotated the prod or prods will be reciprocated vertically to enter and leave the ground, and the prods will also be inclined toward the front and rear to avoid dragging in the soil, and whereby also the sway-bars and prods may be adjusted to assure this action when the prods are set for planting at varying depths, as herein set forth.

3. In a check-row planter, the combination, with a frame, a cranked axle or shaft journaled thereon, and a wheel on said shaft operative by a check-row wire, of a prod or prods hung to wrists of the shaft-cranks, and said wrists provided with a pin, as c^3, a self-closing jaw at the extremity of the prod, and connections from said jaw operative by the pin c^3 for opening the jaw to drop the seed, substantially as herein set forth.

4. In a check-row planter, the combination, with a frame, a cranked axle or shaft journaled thereon, and a wheel on said shaft operative by a check-row wire for rotating the shaft, of a prod or prods hung on wrists of the shaft-cranks, which have pins c^3, and said prods provided with a self-closing jaw, M, of a shaft, O, journaled in the prod or prods and having a crank, o, a pitman connecting said crank to the jaw M, and said shaft O having an arm, o^3, operative by the pin c^3, to open the jaw to drop the seed, substantially as herein set forth.

5. In a check-row planter, the combination, with a frame and a cranked axle or shaft journaled thereon, of a prod or prods hung to said shaft, and said prods having jaws M N, one pivoted to the other and both vertically adjustable together to control the depth of the planting, of a shaft, O, in the prod, provided with a crank, o, and arm o^3, the latter operative by a pin on the crank-wrist to open the self-closing jaw of the prod, and said jaw connected to the crank o by a pitman vertically adjustable on said crank to accommodate the bodily vertical adjustment of the prod-jaws, substantially as herein set forth.

6. In a check-row planter, the combination, with a frame, a cranked axle or shaft journaled thereon, and a wheel on said shaft operative by a check-row wire for rotating the shaft, of a prod or prods having seed-hoppers and journaled on wrists of the shaft-cranks, said wrists provided with a pin, c^3, a self-closing jaw at the extremity of the prod, a seed-delivering wheel journaled in the prod-hopper and adapted for intermittent rotation by the pin c^3 to drop seed into the prod, and connections from the self-closing jaw of the prod operative by the wrist-pin c^3 for opening the jaw to drop the seed, substantially as described, for the purpose set forth.

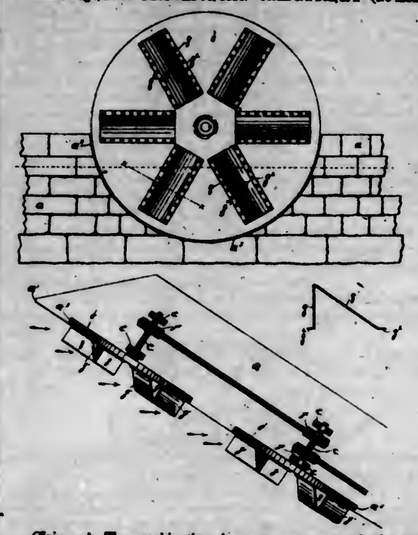
7. In a check-row planter, the combination, with a frame, a cranked axle or shaft journaled thereon, and a wheel on said shaft, of a prod or prods journaled on a wrist or wrists, b', of the shaft, and said wrists provided with a pin, c^3, a seed-delivering wheel, P, on the prods, having peripheral pins p and operative by the pin c^3 to drop the seed, a shaft, O, journaled in the prod and having a crank, o, and arm o^3, and a self-closing jaw, M, in the prod and connected to the shaft-crank o, substantially as shown and described, whereby the jaw M will be opened to deliver one hill of seed and will then close prior to dropping of the next hill of seed into the prod, and both the seed-dropping wheel and the prod-jaw will be operated from the same crank wrist-pin, as herein set forth.

8. In a check-row planter, the combination, with a frame, a cranked shaft journaled thereon, a planting prod or prods hung to the wrist or wrists of said shaft for reciprocation thereby to enter and leave the ground, and a wheel on the shaft operative by a check-row wire to turn the shaft and operate the prods, of an arm fixed to the prod-shaft and a fastening device adapted to hold the extremity of the arm at different positions at the face of the wire-wheel, substantially as described, for the purposes set forth.

9. In a check-row planter, the combination, with a frame or sulky, a cranked shaft journaled thereon and carrying reciprocating planting-prods, and a wheel loose on the shaft provided with a slot, i', and receiving the check-row wire, of an arm, S, fixed to the shaft, and a fastening device, as s, holding said arm to the wire-wheel as its slot i', substantially as herein set forth.

10. In a check-row planter, the combination, with a frame or sulky, a cranked shaft journaled thereon, a planting prod or prods hung to the shaft and vertically reciprocated thereby to enter and leave the ground, substantially as specified, of a wheel, R, held on the prod-shaft to rotate therewith, and provided with a laterally-inclined peripheral face, r, receiving the buttoned check-row wire, and a peripheral slot, r', and a wire-button clutch-wheel, U, journaled in the slot r', and provided with end flanges, u' u', formed with radial teeth, admitting the check-row wire between them while the wire button lodges between said flanges, and a guide leading the wire to the center or higher portion of the inclined wheel-face r of the wheel R, substantially as described, for the purposes set forth.

11. A check-row wire-wheel for a seed-planter made with a laterally-inclined peripheral face and a slot opening at its periphery, and a check-wire-button clutch-wheel journaled in said slot and provided with end flanges formed with teeth admitting the check-row wire between them, while the button lodges between the end flanges, substantially as described, for the purposes set forth.



12. In a check-row planter, the combination, with a frame or sulky, a cranked shaft journaled thereon, a planting prod or prods hung to said shaft, and a wheel on the shaft provided with a laterally-inclined face receiving the check-wire, of a wheel, V, held adjustably to the frame and guiding the wire to the center or higher part of the inclined face of the wire-wheel, substantially as herein set forth.

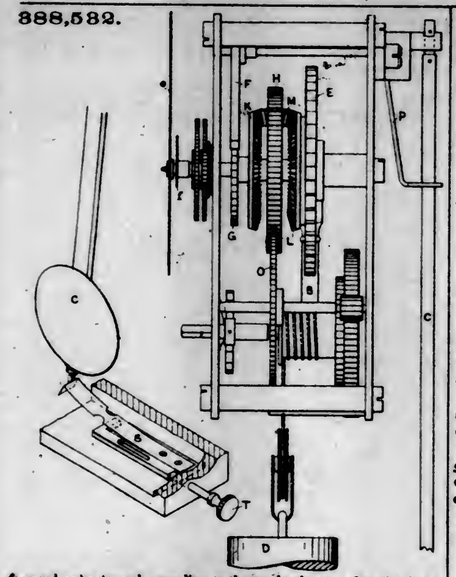
13. In a check-row planter, the combination, with a frame or sulky, of a cranked shaft journaled thereon, a planting prod or prods hung to said shaft for vertical reciprocation thereby, and a wheel on the shaft receiving the check-row wire for operating the prods, and said prods provided with jaws vertically adjustable to regulate the depth of the planting, substantially as herein set forth.

14. In a check-row planter, the combination, with a frame or sulky, of a cranked shaft journaled thereon, a planting prod or prods hung to said shaft for vertical reciprocation thereby, an oscillating cranked shaft journaled to the frame, sway-bars connecting the prods with the crank-wrists of the oscillating shaft, a wheel on the prod-shaft receiving the check-row wire for operating the prods, and said prods provided with vertically-adjustable jaws to regulate the depth of the planting, substantially as described, for the purposes set forth.

15. In a check-row planter, the combination, with a frame, a cranked shaft journaled thereon, a planting prod or prods hung to said shaft for vertical reciprocation thereby, and a wheel on the prod-shaft receiving a check-row wire for operating the prods, of a wheel, P^2, fast on the prod-shaft, and a lever, V', hung to said shaft and provided with a catch-bar, P^3, adapted to the wheel P^2, for raising the prods, substantially as herein set forth.

388,531. CURRENT WATER-WHEEL. Leander Cole, Suspension Bridge, N. Y. Filed Jan. 31, 1888. Serial No. 262,494. (No model.)

Claim.—1. The combination, in a current water-wheel, of the body b of the wheel, being a circular thin head or plate having its whole surface on either side flat or level, and being firmly fastened to the shaft c, with the paddles, blades, or buckets g g', extending most of the way from the circumference or rim of the body b to its center, and made of sheet or plate metal, in the angular form described and shown, g g g^3 g^3, having the projecting front g and brace-back surface g', and the bent edges g^3 g^3, and being attached at their edges g^3 g^3 onto the side of the body b, in the positions shown, and the shaft c, working in journals c c, supported on the pier a, or other suitable foundation, the wheel-surface b, and the paddle or bucket's outer surface, g, and a portion of the inner surface of the brace-back g', together being adapted to receive a portion of the current of the river when the wheel is supported, as described, on the shaft c at the side of the pier a, more or less diagonally in the current of the river, all substantially as and for the purposes set forth.

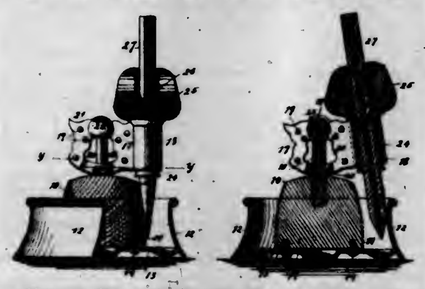


2. In a current water-wheel, the combination of the pier a, having the recess a^3, with the wheel's flat body b, working in said recess, and the shaft c, on which the body b is pinned or fastened, working in journals c c, suitably supported on the pier, and the blades or paddles g g' g^3 g^3, having the front projection, g, and the slanting brace-back g', and being riveted or fastened at their edges g^3 g^3 onto the flat head or body b, in the positions shown, and extending from the rim of the body b nearly to the shaft c, all substantially as and for the purposes set forth.

3. In current water-wheels, the combination of the angular-shaped blades, paddles, or buckets g g' g^3 g^3, with the flat thin head or body b, pinned upon the end of the shaft c, and the shaft c, working in journals c c, supported on the pier a, and the plurality of these wheels connected by any well-known mechanical means, as by the chain band and pulley-wheels f f on their shafts c c, each wheel having upon the current side of its body b the said angular-shaped blades or buckets g g', fastened on at their edges g^3 g^3, and made to reach from the rim of the body b nearly to the shaft c, and having the front projection surface of the blade or paddle g and the slanting brace-back g' in form, the body b and the paddle's outer surface, g, being adapted to receive the current when the wheels are hung at the side of the pier set in a diagonal direction to the course of the current, all substantially as and for the purposes set forth.

388,532. SPEED-INDICATOR. Hermican Comany, Pawtucket, R. I. Filed Apr. 14, 1888. Serial No. 270,698. (No model.)

Claim.—1. A differential speed-indicator consisting of a clock-gear for keeping time, a gear for connection with and operation by an engine, and a differential gear in mesh with both the clock-gear and engine-gear, and provided with indicator-hands arranged to move

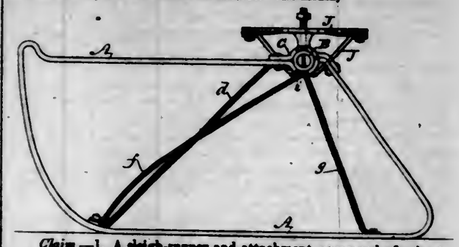


388,532.

forward or backward according to the predominance of motion in the clock or engine gear, substantially as described.

2. A differential speed-indicator consisting of a clock-gear for keeping time, a gear for connection with and operation by an engine, and a differential gear consisting of a bevel-wheel, L, connected to the engine-gear, a bevel-gear, K, connected with the clock-gear, and an intermediate gear, H, carrying upon a radial axis within its plane a bevel-pinion, M, arranged in mesh with both the bevel-gears L and K, and a set of indicator-hands connected to the gear H, substantially as and for the purpose described.

388,533. LEAD-PENCIL SHARPENER. GEORGE H. COURSEN, Baltimore, Md. Filed June 6, 1888. Serial No. 276,282. (No model.)



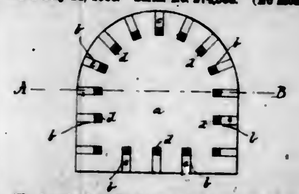
Claim.—1. The combination, with a fixed essentially-conical body having a file-like outer face, of a swinging arm pivoted upon the body, provided with a pencil-holding tube, said arm having a rotary motion, substantially as shown and described.

2. The combination, with a fixed essentially-conical body having a file-like outer face, of a swinging arm pivoted upon the body, a pencil-holding tube integral with said arm, and a finger-piece loosely supported by said tube, substantially as shown and described.

3. The combination, with a fixed essentially-conical body having a file-like outer face, and a post projected from the upper surface of the body, of a swinging arm universally pivoted upon said post, a pencil-carrying tube integral with said arm, a sleeve loosely mounted in said tube, and a finger-piece secured to said sleeve, substantially as shown and described, whereby the arm may be worked upon and revolved around the post, as and for the purpose specified.

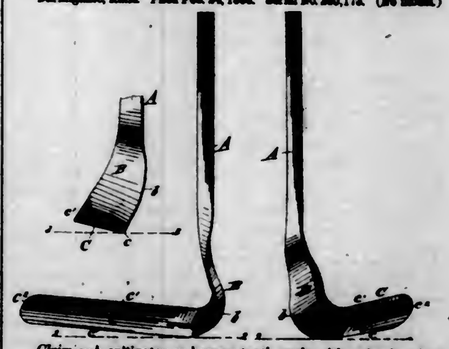
4. The combination, with a fixed essentially-conical body having a file-like outer face, a cup-like base, and a post projected from the upper face of the body, of a swinging arm universally pivoted upon the post, a limiting-link, and a pencil-carrying tube integral with said arm, a sleeve loosely mounted in said tube, and a finger-piece secured to said sleeve, all combined to operate substantially as shown and described.

388,534. SLEIGH. JOHN W. OTT and HENRY OTT, Earlham, Iowa. Filed Feb. 4, 1888. Serial No. 263,016. (No model.)



Claim.—1. A sleigh-runner and attachment composed of a bent bar, A, a brace, *d*, and rods *f* and *g*, terminating in an eye, *h*, and a cap, C, in combination with an axle, B, substantially as shown and described, for the purpose stated.

2. The combination of the bent bar A, the cap C, the brace *d*, and the braces *f* and *g*, united at their top ends and terminating in an eye, *h*, for the purpose stated.



3. The flexible sleigh comprising the runners A, braces *d*, *f*, and *g*, an eye, *h*, at the ends of said braces *f* and *g*, a frame, J, an axle, B, caps C, blocks *k*, and washers and bolts, constructed, arranged, and combined substantially as and for the purpose stated.

388,535. MANUFACTURE OF NAIL-DIES FOR NAILING-MACHINES. EDWARD CROCKER and CHARLES W. STORER, Brockton, and CHARLES D. NASH, Whitman, Mass., (administrators of EDWARD MORTON, deceased,) assignors to the American Nailing Machine Company, of Maine. Filed May 21, 1888. Serial No. 274,532. (No model.)

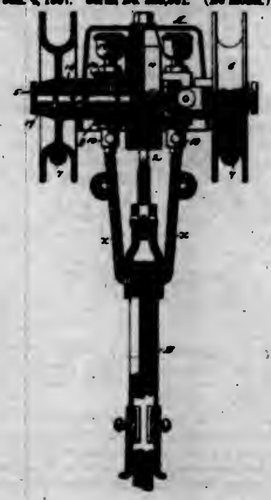
Claim.—The herein-described manner of making perforated nail-dies, consisting in first slitting or grooving the outer periphery of the dies and afterward partially filling up such slits or grooves by the metal pieces *c c c*, and thereby producing the polygonal perforations *d d d*, or equivalent manner, as herein described.

388,536. CULTIVATING HARROW-TOOTH. CARLOS C. CRESS, Buringame, Kans. Filed Feb. 24, 1888. Serial No. 265,173. (No model.)

Claim.—A cultivator or harrow tooth made with a shank, a laterally-extending blade which in direction of its length inclines backward from the axis of the shank, and is sharp at its front edge, and is transversely inclined, so as to be higher at its rear than at its front edge, and said blade connected to the shank by a bend having a vertically and rearwardly curved or inclined sharp front edge, *b*, substantially as described, for the purposes set forth.

388,537. CHURN. WILLIAM H. CHESNUT, Louisville, Ky. Filed Mar. 27, 1888. Serial No. 268,654. (No model.)

388,537.



Claim.—1. The combination, with standards and a churn-body journaled thereon, of a treadle, a pitman connecting the treadle and churn-body, and a pin constructed to pass through an opening in one standard and engage the churn-body for locking the latter against movement, substantially as set forth.

2. The combination, with a frame and a churn-body mounted on said frame, of a plate having a series of open slots secured to the churn-body, and a pin provided with laterally-projecting lugs adapted to be passed through an oval perforation in the frame and into one of the series of slots in the plate, substantially as set forth.

3. The combination, with a frame and a churn-body, of plates secured to the sides of the churn-body, and carrying trunnions upon which said body oscillates, one of said plates being provided with wings, treadles pivoted to the frame, rods pivotally connecting the treadles and plates, and a pin passing through a perforation in the frame and entering an open slot in said plate, substantially as set forth.

4. The combination, with standards and a churn-body journaled thereon, the latter having a series of recesses on one side thereof, of a treadle, a pitman connecting the treadle and churn-body, and a pin constructed to pass through one standard and enter one of the recesses in the churn-body, whereby the latter can be locked in a horizontal or inclined position.

388,538. TRAVELER OR TROLLEY. LEE DAVY, Pittsfield, N. J. Filed Jan. 4, 1887. Serial No. 223,961. (No model.)

Claim.—1. The combination, with two substantially parallel electric conductors, of grooved collecting-wheels adapted to travel in contact with said conductors and carried by a frame provided with laterally-extending journals, upon which said wheels are mounted to have a lateral sliding as well as a rotary motion thereon, substantially as described.

2. An overhead trolley consisting of the frame A, composed of two parts supported by grooved wheels, and having plates 2, projecting downward from said parts and toward each other, and a flexible connecting-plate, 3, between the plates 2, substantially as described.

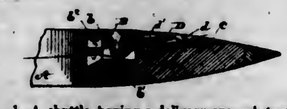
3. An overhead trolley having a frame, A, composed of two parts supported by wheels, and having plates 2 projecting downward from said parts and toward each other, and the flexible spring connecting-plate 3 between the plates 2, in combination with a hollow shield, B, pivotally hung from one of said plates 2, and the conductor passing through the shield, substantially as described.

4. A trolley provided with a frame supporting an insulating-block at each end, journal-pins extending from each block and supporting wheels, and conductors supported by the frame in electrical connection with the wheels, substantially as set forth.

5. The combination, with the insulated blocks and journals of the frame, of wheels turning on the journals, and pivoted contact-pieces bearing upon the wheels and electrically connected with conductors supported by the frame, substantially as set forth.

6. The combination of the insulated journals, wheels, pivoted contact-pieces, and springs and adjusting devices, substantially as described.

388,539. SELF-THREADING LOOM-SHUTTLE. JEAN B. DASSELIN, Fall River, Mass. Filed Oct. 6, 1887. Serial No. 251,617. (No model.)



Claim.—1. A self-threading shuttle having a recess, *a*, a plate lining the front wall of said recess, an opening through the plate, and an opening through the shuttle-body extending forward in an inclined direction to the side of the shuttle-body and communicating with the delivery-eye of the shuttle, said eye being located forward of the recess or nearer the shuttle-point, and a threading-slit through the plate and the shuttle-body communicating with the opening in the plate and with the delivery-eye and intersecting the latter throughout the length thereof, substantially as described.

2. A self-threading shuttle having a recess, *a*, a plate lining the front wall of said recess, an opening through the plate, and an opening through the shuttle-body extending forward in an inclined direction to the side of the shuttle-body and communicating with the delivery-eye of the shuttle, said eye being located forward of the recess or nearer the shuttle-point, and a threading-slit through the plate and the shuttle-body communicating with the opening in the plate and with the delivery-eye and intersecting the latter throughout the length thereof, and a headed thread-post in said recess of the shuttle, substantially as described.

3. The combination, with a shuttle having a recess, *a*, and an opening in said recess substantially in line with the spindle communicating with the delivery-eye of the shuttle, of a headed thread-post located in said recess and provided with thread-engaging notches on the under side of the head to prevent the thread from becoming disengaged from the head of the post, substantially as described.

388,540. SELF-THREADING SHUTTLE FOR LOOMS. JEAN B. DASSELIN, Fall River, Mass. Filed Mar. 19, 1888. Serial No. 267,690. (No model.)

Claim.—1. A shuttle having a delivery-eye substantially in line with the spindle, a substantially-straight delivery-passage leading from the spindle-recess to the said eye, and a threading-slit communicating with said passage, substantially as described.

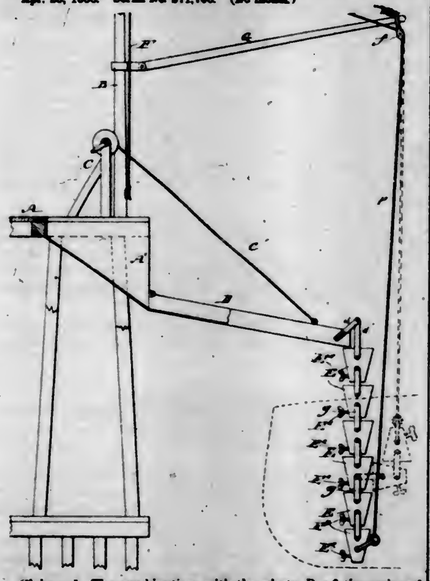
2. A shuttle-thread guide consisting of a tubular metal shell having an opening along its upper side for the admission of the thread, and provided with the slit d^2 and a projection, d', substantially as described.

3. The combination, with a shuttle having a recess, C, forward of the point of the spindle, a delivery-passage leading to said recess, and a threading-slit communicating with said passage, of a thread-

guide located in said delivery-passage, consisting of a tubular shell having an opening along its upper side for the admission of the thread, and the spiral projection *d* at its outer end, the said spiral projection being located in the recess C, substantially as described.

4. The combination, with a shuttle-body having recesses *b* and C forward of the point of the spindle, a threading-slot leading to the recess *b*, and the threading-slit *c*, of the threading-post B in the recess *b*, and a thread-guide between recesses *b* and C, having a longitudinal opening to admit the thread, and the spiral projection *d*, substantially as described.

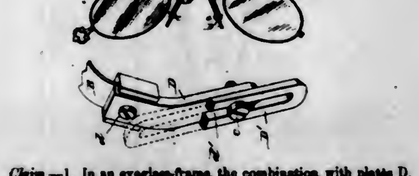
5. The combination, with a shuttle-body having recesses *b* and C forward of the point of the spindle, a threading-slot leading to the recess *b*, and the threading-slit *c*, of the thread-post B in the recess *b*, and a thread-guide between recesses *b* and C, having a longitudinal opening to admit the thread, the slot d^2, and projection d^3, substantially as described.



388,541. **COMMODE, EARTH-CLOSET, OR SIMILAR APPLIANCE.** Charles L. Doll, St. Joseph, Mo. Filed Nov. 2, 1887. Serial No. 254,053. (No model.)

Claim.—1. In a commode, earth-closet, or similar appliance, the combination, with the body thereof divided into two compartments, one for urine and one for feces, of a detachable metal shield inclined rearward, having a central concavity in its upper surface and extending from side to side of the body beneath the seat-aperture, embracing the top of the partition, and an outlet-pipe leading from said urine-compartment, substantially as shown and described.

2. A commode, earth-closet, or similar appliance, provided with a separate compartment for urine and for feces, the dividing-wall inclined rearward and extending from side to side of the body beneath the seat-aperture, and provided with a central concavity in its upper edge in alignment with the seat-aperture, and means, substantially as shown and described, for conveying the urine from the appliance, as set forth.

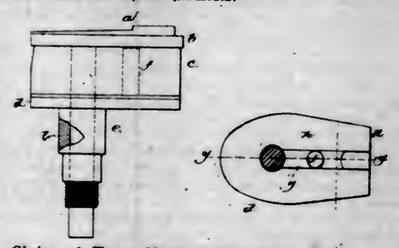


388,542. **COAL-CHUTE.** John H. Du Bois, Hoboken, N. J. Filed Apr. 25, 1888. Serial No. 271,760. (No model.)

Claim.—1. The combination, with the chute D, of the series of tapering hoppers E, connected together by the links *g*, of sufficient length to hold the lower end of each hopper above the upper end of the adjacent hopper, whereby the series of hoppers may be swung out of action one at a time, substantially as described.

2. The hinged chute D, having the connected series of hoppers E, in combination with the boom G, mast B, rope F, and pulleys *f f'*, substantially as described.

388,543. **HARVESTER-GUARD RENOVATOR.** George W. Ean, Holtsville, Ind. Filed June 23, 1888. Serial No. 277,867. (No model.)



Claim.—1. In harvester-guard renovators, the combination, with the guard, of an anvil-plate fitted in its knife-slot and a swage formed with a slot or groove having opposite swaging-edges or shoulders normally fitting the opposite edges of the guard near its knife-slot, substantially as described, whereby when the guard is heated and the plate and swage adjusted to it and the swage is forced home the dulled edges of the guard will be upset and re-formed, as herein set forth.

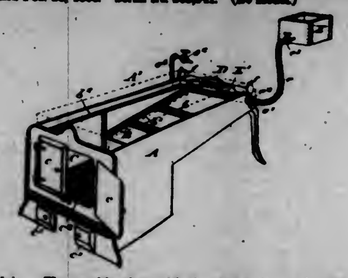
2. In harvester-guard renovators, the swage made with a slot or groove forming opposite swaging-edges normally fitting opposite edges of the guard near its knife-slot, substantially as herein set forth.

3. In harvester-guard renovators, the swage made with a tapering semicircular slot or groove, forming opposite swaging-edges normally fitting opposite edges of the guard near its knife-slot, substantially as herein set forth.

4. In harvester-guard renovators, the combination, with the swaged guard, of a gage having a tongue adapted to the knife-slot of the guard, and also having a shoulder and face adapted to the shoulder and face of the guard fitting the cutter-bar, substantially as described, for the purposes set forth.

388,544. **RIVELING-MACHINE.** Adelbert R. Ellis, Lawrence, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed Mar. 10, 1888. Serial No. 266,859. (No model.)

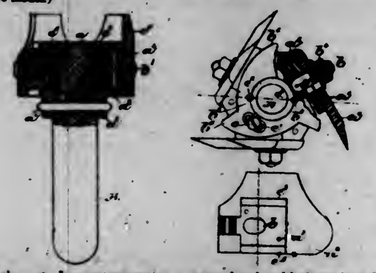
Claim.—1. The combination, with a nail-box having a rod and hole and a driver-plate, of a guide-pin adjustably connected to the driver-plate to enter the hole in the nail-box, substantially as described.



2. In a nail-box, the combination, with a driver-plate having a tubular shank, of an adjustable guide-pin connected to the said plate, substantially as described.

388,545. **NOSE-GUARD FOR EYEGLASSES.** George H. Burnham, Rockport, Me. Filed Mar. 30, 1888. Serial No. 268,969. (No model.)

Claim.—1. In an eyeglass-frame, the combination, with plates D, rigidly attached to the lens-frames, of the longitudinally-slotted nose-plates D', and the clamp-screws *c*, for securing the latter in any desired adjustment, substantially as described.



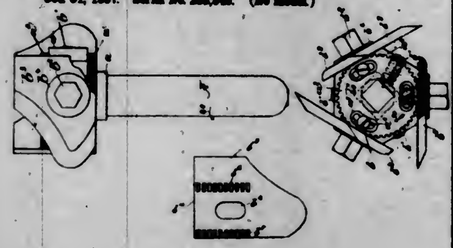
2. The combination, with the eyeglass-spring and its attaching-screws, of the arms D, overlapping the ends of the spring and secured thereto by said screws, and the nose-plates pivoted and sliding upon the inner adjacent faces of the said arms, and screws for adjusting said sliding plates and forming the pivots thereof, substantially as set forth.

388,546. **SUGAR-EVAPORATOR.** Edward S. Burbridge, Warsaw, N. Y., assignor to the Variety Machine Company, same place. Filed Feb. 24, 1888. Serial No. 265,241. (No model.)

Claim.—The combination, with the evaporator-arch, of the supplementary heater underneath the pan at its rear end and below the smoke-exit flue, the supply-receptacle, the flexible pipe-connection, the heater inlow-pipe, the removable cap-collar screw-threaded upon the heater, the discharge-pipe attached to the collar, and the stop-cocks for regulating the flow of the fluid, all arranged substantially as described, and for the purposes set forth.

388,547. **ROTARY CUTTER.** Hadley P. Fairfield, West Medford, and Charles H. Benjamin, Boston, assignors to James W. Brooks, trustee, Cambridge, Mass. Filed Oct. 31, 1887. Serial No. 253,942. (No model.)

Claim.—1. In a rotary cutter, a cutter-head and knives pivotally secured thereto, combined with a cam plate or disk to act on and adjust the said knives simultaneously, substantially as and for the purpose specified.

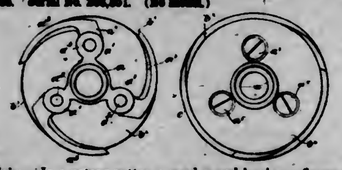


2. The combination, with a shaft, of a thimble or sleeve, *a*, mounted thereon, a cutter-head, knives secured thereto, and a cam plate or disk, b^3, substantially as described.

3. The combination, with a shaft, of a thimble or sleeve, *a*, mounted thereon, a cutter-head, knives pivotally secured thereto, and a cam plate or disk, b^3, substantially as described.

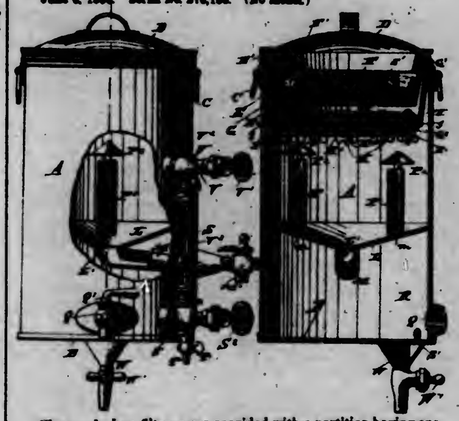
4. The combination, with a shaft, of a thimble or sleeve, *a*, provided with cam projections or flanges, a cutter-head, knives pivotally secured thereto, a cam plate or disk, b^3, and means to firmly fasten the said knives to the cutter-head, substantially as described.

5. The combination, with a shaft, of a thimble or sleeve, *a*, provided with cam projections or flanges, a cutter-head, knife-carrier pivoted thereto, and knives fixed to said carriers, a cam plate or disk, b^3, having a slot, *c'*, means to secure said plate to the cutter-head, and means to firmly fasten the said knives to the cutter-head, substantially as described.



388,548. **ROTARY CUTTER.** Hadley P. Fairfield, West Medford, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed Oct. 31, 1887. Serial No. 253,943. (No model.)

Claim.—1. The herein-described rotary cutter comprising a cutter-head and a cutting knife or blade attached thereto, combined with a toothed gear or plate to adjust the position of the knife or blade on the cutter-head, substantially as described.



2. A rotary cutter comprising a cutter-head and two or more knives provided with teeth on their inner faces, combined with a toothed gear wheel or plate to engage the teeth on the said knives and adjust the position of the knives simultaneously, substantially as described.

388,549. **ROTARY CUTTER.** James F. Freeman, Lawrence, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed Mar. 30, 1888. Serial No. 268,951. (No model.)

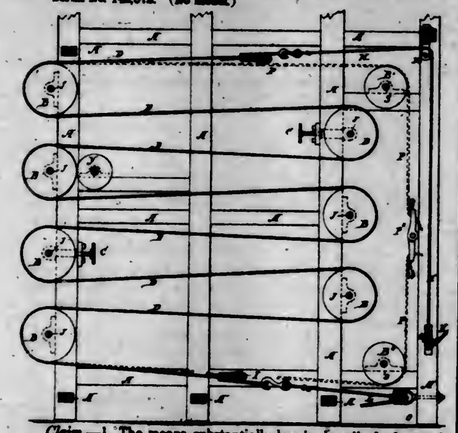
Claim.—In a rotary cutter, a rand-guard having a flange or stop and a cutter-carrier or head, combined with a pivoted knife or blade, the said flange or stop determining the correct working position of the blades, substantially as described.

388,550. **OIL-FILTER.** George W. Gallaway, Rye, N. Y. Filed June 6, 1888. Serial No. 276,188. (No model.)

Claim.—1. In a filter, a can provided with a partition having one or more overflow-pipes, as specified, in combination with one or more filtering-pans mounted above said partition, substantially as described.

2. In a filter, the combination of a can with a pan, G, said pan being provided with an inner lower flange having openings, a ring and felt having openings adapted to register with the openings aforesaid, and bolts and nuts for engaging the parts, substantially as described.

3. In a filter, the combination of a can with a pan, G, said pan being provided with an inner lower flange having openings, rings I I', and felt or fabric H H', said rings and felt being provided with openings adapted to register with the openings aforesaid, and bolts and nuts for engaging the parts, substantially as described.



4. In a filter, a can provided with a sloping partition, L, having one or more overflow-pipes, and a pipe, M, having a cock, M', and a pipe and cock, Q Q', located below the partition, in combination with an upper and a lower filtering-pan, both mounted above the partition, the upper pan being provided with a reticulated bottom, the lower pan having a felt or fabric bottom, substantially as described.

5. In a filter, a can provided with a sloping partition, L, having one or more overflow-pipes, a pipe, M, located below the partition and connected therewith, as specified, side pipe, Q, and bottom pipe, W, both communicating with the can below the partition, the pipes M Q W being provided with cocks, as specified, in combination with one or more filtering-pans mounted above said partition, substantially as described.

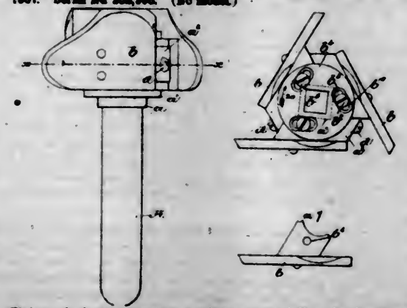
6. In a filter, a can provided with a sloping partition, L, having one or more overflow-pipes, a pipe, M, located below the partition and connected therewith, as specified, side pipe, Q, and bottom pipe, W, the said pipes M Q communicating with the can below the partition aforesaid, each of said pipes being provided with a cock, a glass gage, S, connected at its lower end near the base of the lower compartment

of the can and at its upper end with the upper compartment, in combination with a series of filtering-pans mounted above the partition, substantially as described.

388,551. APPARATUS FOR STRETCHING BELTS. MARMION GANDY, Liverpool, County of Lancaster, England. Filed Sept. 2, 1884. Serial No. 148,072. (No model.)

Claim.—1. The means substantially herein described of stretching belts as part of the process of manufacturing and preparing them for the market, which means consist of a frame, a series of shafts carried by said frame placed at suitable distances apart, a series of stretching-pulleys mounted upon each of said shafts, and stretching devices with which said pulleys are provided.

2. In a belt-stretching machine, the combination of a frame, a series of shafts carried by said frame and placed at suitable distances apart, a series of stretching-pulleys mounted upon each of said shafts, and mechanism, substantially as described, independent of the belt and the tension applied thereto, for communicating motion to said pulleys, substantially as described.



3. In a belt-stretching machine, the combination of two or more shafts mounted one above the other upon the opposite ends of a suitable frame, said shafts being provided with a series of loose pulleys and combined with tension-screws, substantially as described.

4. In a belt-stretching machine, a frame carrying a series of shafts and pulleys placed at suitable distances apart, combined with bearing-rollers *y*, substantially as and for the purpose set forth.

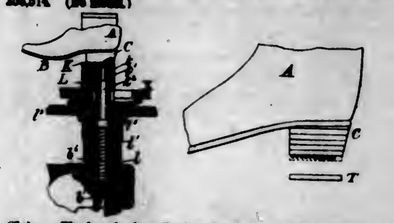
5. In a belt-stretching machine, the combination of a plurality of stretching-shafts provided with tension-screws, and upon each of which are mounted pulleys of different diameters, by which the capacity of the machine for stretching endless belts of different lengths on the same shafts is materially augmented, substantially as described.

6. In the process of stretching belts, the means substantially herein described of securing the ends of the belt, while at the same time the belt is kept taut and is permitted to run freely around the pulley in the operation of stretching, which means consists of the adjustable clasp into which the respective ends of the belt are drawn and secured substantially as described.

388,552. ROTARY CUTTER. CHARLES W. GILDDEN, Lynn, assignor to James W. Brown, trustee, Cambridge, Mass. Filed Oct. 31, 1887. Serial No. 253,993. (No model.)

Claim.—1. A rotary cutter consisting, essentially, of a head and two or more blades thereon, combined with means, substantially as described, to simultaneously and automatically adjust the blades with relation to the head, and with means to confine the blades in an adjusted position, for the purpose set forth.

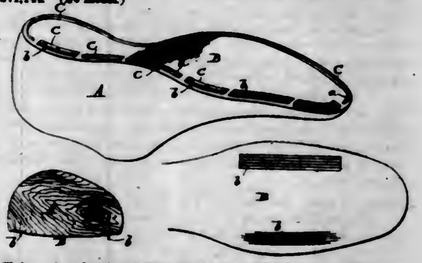
2. The herein-described rotary cutter, it consisting, essentially, of a cutter-head having a radial guideway, and a knife-carrier fitted therein, combined with a disk having a slot eccentric to the center of the said disk, and with means for adjustment secured to the knife-carrier and adapted to be acted upon by the said slot, substantially as described.



3. The combination, with a shaft, of a rotary cutter adapted to be secured thereto, the said cutter comprising a cutter-head having radial guideways, a knife-carrier fitted therein, a disk, b^4, provided with slots arranged eccentric to the center of the said disk, and screws to unite said knife-carrier and disk, substantially as described.

4. In a rotary cutter, a cutter-head having radial guideways and a knife-carrier fitted in each guideway, combined with a disk, b^4, having cam-slots b^5, and a screw inserted through each slot and adapted to be acted upon by it to move the knife-carrier, substantially as described.

5. The combination, in a rotary cutter, of a tangentially-adjustable knife-carrier with an actuating disk or plate therefor to adjust the said knife-carrier, substantially as described.

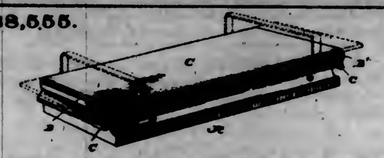


6. The combination, with a shaft, of a rotary cutter comprising a cutter-head, c^6, radially-adjustable knife-carriers carried thereby, the disk b^4, provided with cam-slots b^5, and disk c', having like slots to register with the cam-slots b^5, and screws b^6, substantially as described.

388,553. MODE OF ATTACHING HEELS AND TOP LIFTS TO BOOTS OR SHOES. CHARLES W. GILDDEN, Lynn, assignor to James W. Brown, trustee, Cambridge, Mass. Filed Dec. 20, 1887. Serial No. 258,514. (No model.)

Claim.—The herein-described method of attaching a heel and top lift to a sole of a boot or shoe, which consists in driving the nail from the heel into the sole to secure the heel to the sole, and while the heel is yet under pressure and the nail at rest further compressing the heel bodily in the direction of its length and of the nails, leaving the heads of the nails projecting from the end of the consolidated heel, and thereafter blinding the top lift upon the protruding heads of the nails, substantially as set forth.

388,554. LAST. HENRY M. GOODNOW, Rochester, N. Y., assignor to William S. King, Minneapolis, Minn. Filed Apr. 19, 1888. Serial No. 271,144. (No model.)



Claim.—1. A last having its sole-face provided with metallic pieces formed with sharp edges or teeth facing toward the outer edges of the last.

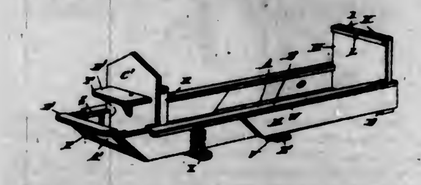
2. In combination with a last having a groove or grooves in its sole-face near its edges, a metallic piece or pieces secured to the sole of the last within the line of said groove or grooves and presenting angular edges toward the edges of the last.

3. A last having its sole-face provided with a groove or grooves formed with sharp angular edges to their inner walls, substantially as set forth.

388,555. BLACKBOARD-ERASER. HARRY C. GOODRICH, Chicago, Ill., assignor to Thomas Kane & Company, of Illinois. Filed June 19, 1888. Serial No. 277,202. (No model.)

388,555.

Claim.—The herein-described blackboard-eraser, consisting of the block or body A, the two U-shaped clasps pivoted to its ends, and the facing of felt material applied to and bent over the ends of the block and confined against the ends by the clasps, as described and shown.



388,556. GLASS-MOLD. WILLIAM HALEY, Beaver Falls, Pa., assignor of one-half to John Carlon, same place. Filed Mar. 20, 1888. Serial No. 268,212. (No model.)

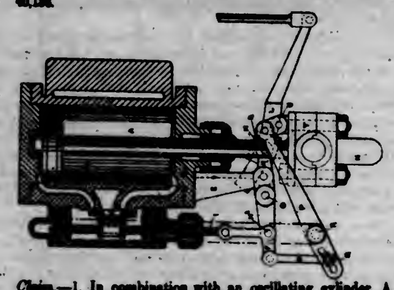
Claim.—1. In a mold, the hinged main body part and a two-part handle portion, the latter being provided with surfaces adapted to be locked in the hinged portion of the mold.

2. The combination, in a mold, of the duplex sliding plugs and a two-part handle portion interposed between the plugs.

388,557. WAGON-BED. ANDREW H. HALL, Raymond, Dak. Filed May 31, 1888. Serial No. 275,612. (No model.)

Claim.—1. In a wagon-bed, the combination of the bottom A, the sides M, detachable therefrom and having the guideways at their front ends on their inner sides, the front board, A', inserted in the said guideways, the cross-bar *D* on the under side of the bottom, at the rear end thereof, having its ends bearing against the under edges of the sides M, the cross-bar E under the center of the bottom, having its ends engaged by keepers V, that depend from the sides, and the bolster having the standards bearing against the outer sides of the body, substantially as described.

2. The combination, with the wagon-body having the vertical guide-ways in opposite sides at its front end, of the board C', detachably fitted in said guideways and having the cast on its front side, substantially as described.



3. The combination of the wagon-body, the end-gate hinged to the rear end thereof, the sliding frame in the body, and the devices, substantially as set forth, to secure said sliding frame to the end-gate when the latter is extended horizontally, substantially as described.

4. The combination, with the body or box, of the end-gate hinged thereto, the sliding frame having the rearward-extending arms adapted to be connected to the end-gate to secure the latter in a horizontal position, said frame being further provided with the transversely-extending bar C', and the wings detachably secured to the sides of the bed or body and supported by the bar C', substantially as described.

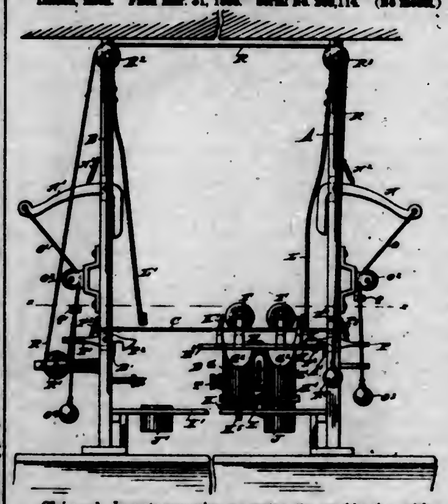
5. The combination of the bed or body, the end-gate hinged thereto and adapted to be extended to a horizontal position from the rear end of the body, and the rack-frame having the arms or hooks at its lower end adapted to engage keepers at the outer end of the end-gate, substantially as described.

6. The combination of the bed or body, the end-gate hinged to the rear end thereof, the frame or devices to secure said end-gate in a horizontal position, the wings detachably connected to the sides of the bed or body, the vertical boards C' near the front end of the bed or body, the standard adapted to be secured to said board, having its cross-bars at its upper end, and the rack-frame adapted to be secured to the rear end of the end-gate, substantially as described.

388,558. VARIABLE EXPANSIVE AND REVERSING MOTION FOR OSCILLATING-CYLINDER ENGINES. JOHN W. HAMLEY, Stoke-on-Trent, County of Stafford, England. Filed Oct. 14, 1887. Serial No. 252,355. (No model.) Patented in England Mar. 30, 1886, No. 3,927; in France Dec. 15, 1886, No. 180,886, and in Germany Dec. 31, 1886, No. 40,126.

Claim.—1. In combination with an oscillating cylinder, A, the reversing-lever X, curved link L, slide-block K, and lever H, linked or jointed to the block K and to the valve-rod I, and pivoted on a fulcrum oscillating with cylinder A, substantially as described.

2. The combination of reversing-link L, slide-block K, and lever H, connecting same to the valve-rod with fulcrum G, having motion taken from the piston-rod, but reduced in amount.



3. The combination, in an oscillating engine, of the fulcrum G of the lever H, (whereby the slide-block is connected to the valve-rod,) with lever F, fulcrumed on a point rigidly fixed to the cylinder, and devices O P U, for transmitting a reduced motion from the piston-rod, substantially as and for the purposes described.

4. The combination, in an oscillating engine, of the lever H, that gives motion to the valve-rod, with a fulcrum, G, having a motion corresponding to that of the piston-rod, but reduced, whereby the necessary additional travel of the valve is obtained to allow for lap and lead and to work expansively.

5. The combination, in a valve-gear for eccentric engines, of the lever F, carrying the fulcrum of the valve-rod-actuating lever H, link O, slotted lever Q, and link U, connecting Q to the piston-connections, whereby the motion of the piston in a reduced form is transmitted to the valve-rod-actuating lever H.

6. The mechanism for regulating the lead in oscillating engines, consisting of a lever, F, carrying the fulcrum of the valve-rod-actuating lever H, a lever, P, oscillating on a point, R, oscillating with the cylinder and linked to the piston-rod connections, with a rod, O, capable of being attached to lever P at any required point between limits by means of a linking device, Q.

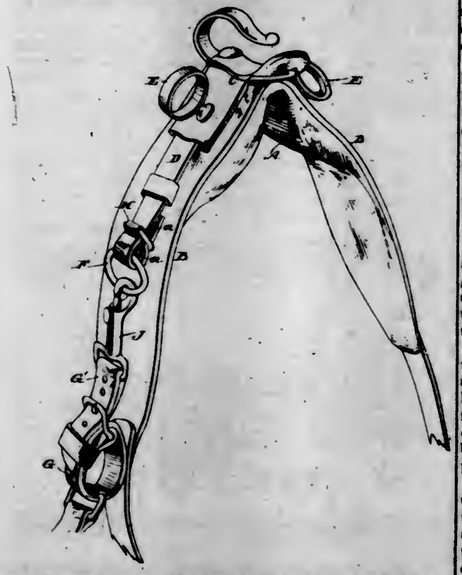
388,559. STORE-SERVICE APPARATUS. HERBERT HERBERT, Lake Linden, Mich. Filed Mar. 31, 1888. Serial No. 269,114. (No model.)

Claim.—1. In a store-service apparatus, the combination, with a carrier provided with two open-bottom compartments, of a bottom

for alternately closing the lower ends of the compartments carried by the carrier, and means for preventing the bottom from moving with the carrier as it nears the end of its route, substantially as described.

2. In a store-service apparatus, the combination, with a track, of a carrier provided with two compartments and a bottom adapted to close said two compartments alternately, substantially as shown and described.

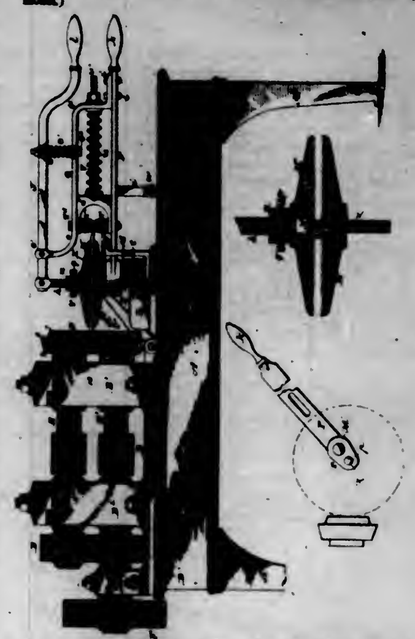
3. In a store-service apparatus, the combination, with a carrier provided with two open-bottom compartments, of a bottom fitted to slide on the carrier and provided with downwardly-projecting lugs, and a stationary plate with which the lugs of the bottom engage to prevent it from moving with the carrier, substantially as described.



4. In a store-service apparatus, the combination, with a track, of the carrier D, provided with the plate E, having the upwardly-projecting lugs K K', and on which are mounted the wheels F, traveling on the track, the springs L L' for engaging the lugs K K' of the carrier, the pivoted and spring-held levers N N', and the cords O O', substantially as herein shown and described.

5. In a store-service apparatus, the combination, with a carrier provided with two compartments and a track on which the said carrier is held to travel, of a spring-catch at each end of the track for locking the said carrier in place at either end of the track, a spring operating on the said carrier to force it from one end of the track to the other, a lever acting on the said spring to give it the necessary tension, a rope connected with the said lever, a block secured on the said rope and adapted to operate on the said spring-catch so as to release the carrier after the said spring has received the necessary tension, and a second rope connected with one of the said ropes and extending to the other end of the track, substantially as shown and described.

6. In a store-service apparatus, the combination, with a track and two fixed plates held at either end of the said track, of a carrier provided with two compartments and traveling on the said track, and a bottom adapted to close alternately the lower ends of the said two compartments, said bottom being held to slide on suitable guideways secured to the said two compartments, substantially as shown and described.



7. In a store-service apparatus, the combination, with a track and two fixed plates held at either end of the said track, of a carrier provided with two compartments and traveling on the said track, a bottom adapted to close alternately the lower ends of the said two compartments, said bottom being held to slide on suitable guideways secured to the said two compartments, and vertically-sliding bolts operated by the said plates and adapted to lock said bottom in place under either compartment, substantially as shown and described.

888,560. HARNESS. Marshall M. Hitt, Luray, Va. Filed Jan. 30, 1868. Serial No. 362,360. (No model.)

Claim.—In a gig-saddle, the skirts B and tug-straps D, held by the terrets E, and folded under at the lower ends and secured permanently to the skirts, in combination with the ring F, trace-loop G, and snap-hook J, secured to said loop, substantially as described.

888,561. MACHINE FOR MAKING DISKS FOR HARROWS. William J. Hogan, Johnstown, Pa., assignor to The Cambria Iron Company, of Pennsylvania. Filed May 11, 1868. Serial No. 372,804. (No model.)

Claim.—1. The combination, with a set of rolls, of clamping-plates and a device for automatically clamping said plates upon a disk, substantially as set forth.

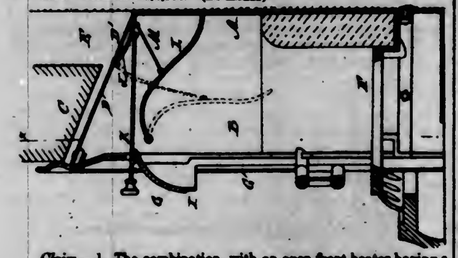
2. The combination, with a set of rolls, of a lever, clamping-plates revolubly supported thereon, one of said plates being spring-actuated, and a spring-actuated sliding block adapted to slide in the lever, substantially as set forth.

3. The combination, with a set of rolls, of a laterally-swinging lever, clamping-plates revolubly supported in the short arm of the lever in order that the position of the plates relative to the rolls may be varied, and a spring-actuated block adapted to slide in the lever, said block having rollers therein adapted to bear yieldingly against the periphery of a disk held by the clamping-plates, substantially as set forth.

4. The combination, with a set of rolls, of a lever pivotally supported on a fixed block, a spring-actuated lever pivoted on said lever, and clamping-plates revolubly supported on each of the levers, substantially as set forth.

5. The combination, with a frame, housings mounted on this frame and boxes adjusted to play in them housings, of two shafts that are geared to revolve toward each other, and a roll-head secured to each shaft, these rolls being formed with duplicate-shaped ends to permit their reversal and the use of either set of the roll-head ends, substantially as set forth.

6. The combination, with a frame, a saddle-block secured to this frame, a lever pivoted upon the saddle-block so as to swing sidewise, and two mated clamping-plates revolubly supported by the pivoted lever near its fulcrum-point, of a bracket-arm attached to the top face of the swinging lever by one end, and a handle-bar pivoted to the other end of this bracket-arm and pivotally attached to the upper bifurcated end of a bolt which is swivel-connected to the top clamping-plate by its other or lower end, substantially as set forth.

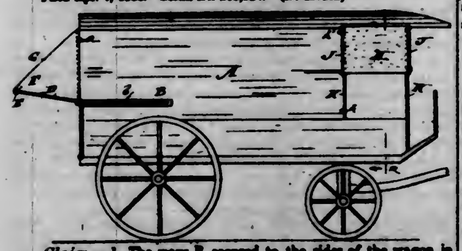


7. The combination, with a clamping-plate supported to receive on the end of a lever and having its top face grooved concentrically to reduce its bearing-surface, of another clamping-plate similarly grooved and loosely connected to a handle-bar by a swivel-bolt, which allows the upper clamping-plate to rotate with the lower end and be vertically moved by a handle-bar, substantially as set forth.

8. The combination, with two rolls supported and adapted to rotate toward each other, the ends of which are formed to roll a beveled edge upon an inserted flat circular metal plate, of a pair of clamping-plates that are held from a lateral displacement of their edges and are adapted to clamp a metal disk between them, and grooved thimbles which are supported to rotate and are by spring action caused to bear against the revolving edge of a clamped disk at a point opposite the axial centers of the rolls, substantially as set forth.

9. The combination, with a frame, a saddle-block, a lever pivoted on the saddle-block and provided with a depending arm and its pivoted roller or wheel that bears upon the upper face of the frame, and a pair of mated clamping-plates that are prevented from edgewise displacement and are adapted to clamp a harrow-disk between them, of a bracket-arm that is attached to the top surface of the pivoted lever, a handle-bar pivoted to the bracket-arm, a sliding block, a spiral spring that bears against the sliding block, grooved thimbles revolubly mounted on the sliding block, a swivel-bolt that connects the top clamping-plate with the handle-bar, and a spring which presses the top plate toward the lower plate, substantially as set forth.

10. The combination, with a pair of rolls supported and rotated toward each other, which are shaped to produce a beveled edge on a harrow-disk, of two clamping-plates which are adapted to clamp the body of a metal disk concentric with their edges and present its periphery to the adjacent faces of two revolving rolls, and a milling or grinding device that is supported to engage the beveled edge of this disk and remove slight inequalities from it while it is being rotated, substantially as set forth.



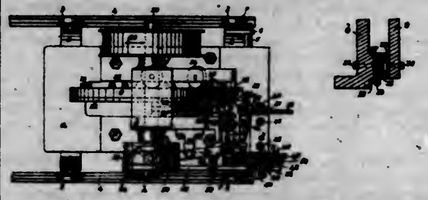
888,562. OPEN-FRONT HEATER. John Hogan, Brooklyn, N.Y., assignor of one-half to Robert B. Rogerson, same place. Filed Apr. 13, 1868. Serial No. 370,208. (No model.)

Claim.—1. The combination, with an open-front heater having a smoke-outlet in its rear upper part, of a downward-swinging deflector-plate hinged at its forward edge near the front of the heater below the said outlet and inclined or curved rearwardly and downwardly to the back wall of the heater, space for draft being left between the front hinged edge of the deflecting-plate and the front of the heater, and a rod for operating the deflector, whereby the products of combustion may be deflected to the front of the heater and then to the outlet, or pass directly to the outlet between the rear side of the deflector and back of heater, according to the position of the deflector, the said outlet, however, being never closed by said deflector, substantially as set forth.

2. The combination, with an open-front heater having a flue-opening in its top, of a hinged damper adapted to the flue-opening, a hinged baffling and deflecting plate below the damper, a link connecting the damper and baffling and deflecting plate, and means for adjusting them conjointly, substantially as described.

888,563. WAGON-CURTAIN. John H. Hogan, Brooklyn, N. Y. Filed Apr. 7, 1868. Serial No. 369,897. (No model.)

Claim.—1. The ways B, secured to the sides of the wagon in horizontal position, and the blocks C, placed in said ways, in combination with the arms D, attached to said blocks, the rod E, and curtain G, all arranged to operate substantially as described.



2. The arms D D, held by sliding blocks C, and the horizontal ways B, in combination with the rod E, tube F, and curtain G, substantially as described.

888,564. EINERARD. Garnet B. Johnson, New York, N. Y. Filed Oct. 4, 1867. Serial No. 351,621. (No model.)

Claim.—The herein-described inkstand, as an improved article of manufacture, consisting of a base provided with an aligned series of ink-wells, lids thereafter hinged to the top of the base, an eye attached to the back of each lid between the hinge-joint and the free front edge of the lid, a series of like posts fixed to and projecting upward from the top of the base between successive lids and just outside the two end lids, said posts having heads on their upper ends formed with transverse holes in a common line a short distance in front of the line of hinge-joints, and a slack cable fastened immovably at either end in the holes of the two outside posts and running loosely through the holes in the intermediate posts and through the said eyes on the lids substantially as specified.

888,565. METAL-ROLLING MACHINE. Daniel B. Kenyon, Boston, Mass. Filed June 6, 1868. Serial No. 376,171. (No model.)

Claim.—1. In an organized metal-rolling mill, cutters or automatic mechanism for severing the metal blanks from the rod prior to rolling or forging them, in combination with plate or platen dies arranged and adapted to roll-forge metal articles by rotating said blanks between their adjacent die-faces, for the purpose set forth.

2. In an organized metal-rolling mill, feed-rolls or automatic mechanism for feeding the blank metal into the machine, in combination with plate or platen dies arranged and adapted to roll-forge articles from said blank metal by rotating it between their adjacent die-faces, for the purpose set forth.

3. In an organized metal-rolling mill, automatic blank-feeding mechanism and automatic blank-severing mechanism, in combination with plate or platen dies arranged and adapted to roll-forge metal articles by rotating said blanks between their adjacent die-faces, for the purpose set forth.

4. In an organized system or metal-rolling mill, a furnace or means for heating the metal rod, and automatic rod-feeding mechanism and automatic blank-severing mechanism, in combination with plate or platen dies arranged and adapted to roll-forge metal articles by rotating them between their adjacent die-faces, for the purpose set forth.

5. In an organized system or metal-rolling mill, a reel or support for the metal rod, and a furnace or means for heating said rod, and automatic rod-feeding mechanism and automatic rod-severing mechanism, in combination with the plate or platen dies arranged and adapted to roll-forge metal articles by rotating them between their adjacent die-faces, for the purpose set forth.

6. In an organized system or metal-rolling mill, a reel or support for the metal rod, and automatic rod-feeding mechanism and automatic blank-severing mechanism, in combination with plate or platen dies arranged and adapted to roll-forge metal articles by rotating them between their adjacent die-faces, for the purpose set forth.

7. In an organized system or metal-rolling mill, a support for the metal being worked and automatic feeding mechanism, in combination with plate or platen dies arranged and adapted to roll-forge metal articles by rotating them between their adjacent die-faces, for the purpose set forth.

8. In an organized system or metal-rolling mill, a reel or support for the metal rod and automatic cutters for severing the blanks from said rod, in combination with plate or platen dies arranged and adapted to roll-forge metal articles from said blanks by rotating them between their adjacent die-faces, for the purpose set forth.

9. In an organized system or metal-rolling mill, a furnace or means for heating the metal blanks and automatic blank-feeding mechanism,

in combination with plate or platen dies arranged and adapted to roll-forge metal articles by rotating said blanks between their adjacent die-faces, for the purpose set forth.

10. In an organized system or metal-rolling mill, a furnace for heating the rod or bar and automatic cutters for severing metal blanks therefrom, in combination with plate or platen dies arranged and adapted to roll-forge metal articles by rotating said blanks between their adjacent die-faces, for the purpose set forth.

11. In a metal-rolling machine, the combination of a stationary plate or platen die and a movable plate or platen die, for the purpose herein set forth.

12. In a metal-rolling machine, a stationary plate or platen die and a movable plate or platen die, combined with each other and with mechanism for operating said movable die, for the purpose set forth.

13. In a metal-rolling machine, a stationary plate or platen die and a movable plate or platen die, combined with each other and with mechanism for operating said movable die, and with mechanism for adjusting the distance between said dies, for the purpose herein described.

14. In a metal-rolling machine, a stationary die and a movable die, combined with each other and with mechanism for operating said movable die and with mechanism for feeding into said dies the metal blanks to be roll-forged thereby, for the purpose herein set forth.

15. In a metal-rolling machine, a stationary die and a movable die, combined with each other and with mechanism for operating said movable die and with rod-feeding mechanism and with rod-severing mechanism, for the purpose herein set forth.

16. In a metal-rolling machine, the combination of a supporting frame or bed, a stationary die thereon, a shaft and suitable bearings therefor, a die-carrier supported by said shaft, and a die on said carrier, all arranged to operate substantially as herein set forth.

17. In a metal-rolling machine, the combination of a supporting frame or bed, a cut-off stand and its cutters, a shaft and suitable bearings therefor, a cut-off cam on said shaft, and connecting mechanism whereby said cutters are operated by said cam, substantially as set forth.

18. In a metal-rolling machine, the combination of a supporting frame or bed, a feed-stand and its feed-rolls, a shaft and suitable bearings therefor, a feed-cam on said shaft, and connecting mechanism whereby said feed-rolls are operated by said cam, substantially as set forth.

19. In a metal-rolling machine, a frame or bed, a shaft suitably supported thereon, a cut-off cam on said shaft, a pivoted rocker-lever supported by said frame or bed and operated by said cam, a cut-off stand and a stationary cutter thereon, a cutter-bar operated by said rocker-lever and reciprocating on said stand, and a cutter on said bar, all combined to operate substantially as set forth.

20. In a metal-rolling machine, a frame or bed, a cut-off stand having cutters thereon and suitable connecting mechanism for operating said cutters, in combination with a rod-guide having a limitable movement and means for retaining it in a proper normal position, to operate substantially as set forth.

21. In a metal-rolling machine, a frame or bed, a shaft suitably supported thereby, a feed-cam on said shaft, a pivoted vibrating lever supported by said bed and operated by said cam, a feed-pawl connected with said lever, a feed-stand having feed-rolls thereon, and a feed-ratchet to be operated by said pawl and revolve said feed-rolls, all arranged and combined substantially as described, to operate as specified.

22. In a metal-rolling machine, a feed-stand having feed-rolls on shafts connected by gearing and having a connecting feed-ratchet, and notched disk provided with a detent having a pin or projection, as described, in combination with a feed-pawl and its operating mechanism and its supporting slotted arm and spring, and the cam-lever or means for throwing said pawl and detent into or out of action or engagement with said feed-ratchet and notched disk, substantially as herein described, and for the purpose specified.

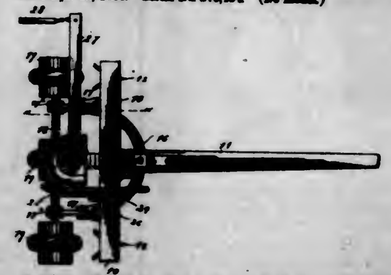
23. A stationary die and a series of movable dies, all provided with working-faces and adapted to roll-forge metal articles having circular cross-sectional area, combined with each other and with mechanism for operating said series of movable dies, substantially as herein set forth.

24. A frame and its stationary die combined with an adjusting-wedge and means for moving the same, substantially as and for the purpose specified.

25. In a machine for roll-forging metal articles having circular cross-sectional area, and having mechanism for severing said metal articles from its rod or bar, the combination, with said mechanism, of means, substantially as described, for admitting of a longitudinal or fore-and-aft adjustment of the same, for the purpose herein specified.

26. In a machine for roll-forging metal, a frame or bed and a carved plate or platen die secured thereon, combined with a die-carrier supported so as to revolve on said frame or bed, and having a series of carved plate or platen dies secured on said carrier and moving therewith, to operate substantially as herein specified.

27. A frame and a revolving die-carrier, in combination with anti-friction rollers, to operate substantially as and for the purpose set forth.



28. In an organized system of roll-forging metal, a furnace or means for heating said metal, in combination with a rolling-machine having dies arranged and adapted to roll-forge metal into circular cross-sectional form by rotating said metal between the adjacent and converging faces of said dies, and carrying-wheels arranged and adapted for transporting said rolling-machine to and from said heating-furnace, for the purpose set forth.

29. A machine for roll-forging metal in the manner described or having circular cross-sectional area and having supporting carrying-wheels, combined with rails or tracks and mechanism for locking said machine stationary thereon, for the purpose specified.

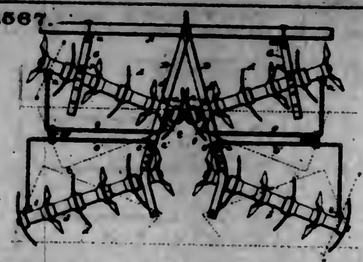
30. The feed-stand and its feed-rolls and shafts connected by gearing, as described, and the feed-ratchet, combined with the larger gear meshing with said feed-gears and operated by said ratchet, whereby with a small movement of the latter a long length of metal rod may be fed into the machine by the said feed-rolls, for the purpose set forth.

31. In a metal-rolling machine, dies for cross-rolling or roll-forging metal articles having circular cross-sectional area from metal blanks separated from the rod or bar, said dies consisting of carved plates or platens having their forming, reducing, and spreading surfaces entirely within working-grooves running in a line coincident with the travel of the moving die, whereby the metal blank is bodily confined and guided while traveling in a planetary manner and being rolled therein, substantially as set forth.

388,566. DITCHING-MACHINE. Isaac H. Kinney, Beloit City, Idaho, assignor to himself, and George A. Lowe, Salt Lake City, Utah. Filed Apr. 10, 1882. Serial No. 270,154. (No model.)

Claim.—1. The combination, with a plow-beam provided with a series of plows upon the under side, of a shaft held parallel with said beam, rollers mounted to revolve upon said shaft in alignment with the plows, and a means, substantially as described, for raising and lowering the beam relatively to the shaft, as and for the purpose specified.

2. The combination, with a plow-beam having plows attached to the under side, of a shaft parallel with the plow-beam, held in hinged connection therewith, rollers mounted to revolve upon said shaft in alignment with said plows, a rack pivoted upon said beam, and a lever upon said shaft, whereby the beam and plows may be raised or lowered, as and for the purpose specified.



3. The combination, with a plow-beam having plows adjustably attached to the under side thereof and a shaft supported by hinge-connections to and parallel with the plow-beam, of adjustable rollers mounted to revolve upon said shaft, a segmental rack pivoted to said beam, and a lever engaging said segmental rack fast upon the shaft, substantially as and for the purpose specified.

4. The combination, with a plow-beam, of plows secured to the under side of said beam, a shaft provided with arms and held parallel with the plow-beam by hinged connections, a segmental rack pivoted to said beam, a lever held to the shaft and engaging said rack, rollers journaled upon the said shaft in alignment with the plow, a coat projected upward and rearward from the plow-beam, a marker-beam pivoted beneath the coat extending longitudinally and parallel with the shaft beyond the end of the same, and a marker attached to the extremity of said marker-beam, substantially as and for the purpose specified.

388,567. HARROW. Charles La Dow, Albany, N. Y. Filed July 27, 1882. Serial No. 231,173. (No model.)

Claim.—1. In a harrow, leading gangs of revolving cutters set at angles to the draft and arranged to throw the earth outwardly, in combination with following gangs which throw the earth inwardly, whereby the furrow left between the leading gangs is filled by the following gangs, as set forth, the pair of gangs on each side of the draft-line being free to revolve and vibrate independently of the opposite pair.

388,567.

2. In a harrow, the combination of four rotary gangs of cutters set at angles to the draft, the pair of gangs on each side of the central draft-line being disconnected from the opposite pair and arranged one in front of the other, and connected together by yoke-frames or equivalent devices, so as to form a section which may vibrate independently of the other section, substantially as set forth.

3. In a harrow, four gangs of revolving cutters set at angles to each other, the pair of gangs on each side of the central draft-line being arranged one in front of the other and to cut in reverse directions, whereby the end-thrust of one gang counteracts that of the other, in combination with yoking or equivalent mechanism, whereby said gangs in each pair are united to form a section which may vibrate independently of the other section.

4. The combination of draft devices and four gangs of rotary cutters set at angles to the draft, the pair on each side of the machine being arranged one in front of the other and to cut in reverse directions, whereby the end-thrust of one of said gangs counteracts that of the other, flexible connections between the front and rear gangs of each pair which permit their free vibration, and connections between each pair and the draft attachment of the machine, whereby each of said pairs of gangs forms a section of the harrow which is free to vibrate independently of the opposite section, and said cutters forming the sole support for their draft-frame.

5. The combination, with a draft beam or frame, of cutter-gangs arranged in pairs on each side of the draft-line, the gangs in each pair cutting in reverse directions and being placed one in front of another, and both connected to each other and to the draft beam or frame, said cutters supporting the draft-frame in which they are mounted.

6. The combination, with a draft beam or frame, of cutter-gangs arranged in pairs on each side of the draft-line, the leading gangs in the pairs being set to throw the earth from the center of the machine, and with their adjacent inner cutters in close proximity to each other, so as to cut a central furrow, and the rear gangs being set to throw the earth toward the center of the machine, and their adjacent inner cutters placed so as to throw the earth into said central furrow, said cutters supporting and guiding the frame in which each gang is journaled.

7. In a harrow, two vibratory pairs of gangs placed on opposite sides of a central draft-line, the gangs of each pair being placed one in front of another, cutting in reverse directions, and so arranged that the cutters of the rear gang cut out the spaces left between the cutters of the leading gang, in combination with a draft-frame mounted upon and supported by said cutter-gangs.

8. The combination, with a frame or draft-beam, of cutter-gangs supporting said frame and arranged in pairs on each side of the central draft-line, the gangs in each pair being placed one in front of another and adjustably connected with each other.

9. The combination, with a cross or draft beam arranged at right angles to the draft-line, of cutter-gangs in rear thereof supporting the draft-frame and arranged in pairs placed on each side of the draft-line, the gangs in each pair being arranged one in front of another and each connected to said cross-bar by an adjustable draft-connection.

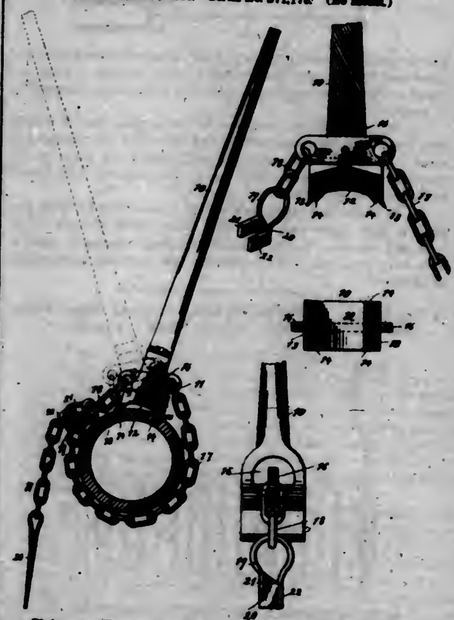
10. In a harrow, the combination of pairs of cutter-gangs arranged on opposite sides of a central draft-line, the gangs of each pair being placed one in front of another and cutting in reverse directions, and each pair being capable of vibrating independently of the other pair, said cutter-gangs being weighted by the draft-frame to enforce their action.

11. In a harrow, the combination, with pairs of cutter-gangs arranged on opposite sides of the draft-line, the gangs of each pair being placed one in front of another, cutting in reverse directions and adjustably connected with each other, of devices for adjusting the angle of the gangs to the line of draft, said adjusting devices being supported by the cutter-gangs.

12. The combination, with a frame or draft devices, of revolving cutter-gangs arranged in pairs on opposite sides of the draft-line, each pair of gangs being capable of vertical vibration, but the individual gangs being incapable of vertical vibration.

13. The combination, with front and rear gangs, of interposed angular connecting-frames or yokes O O', each having a long and short arm for connection with its gang.

14. The combination, with front and rear gangs and angular connecting frames or yokes O O', hinged or flexibly connected with each other and each having long and short arms for connection with its gang, of mechanism for adjusting the angles of the gangs.



15. In a harrow, the combination of a rigid transverse draft bar or frame, A, extending across the front of the machine, vibratory pairs of cutter-gangs in rear thereof arranged on opposite sides of a central draft-line, and adjustable draft-connections or draw-bars extending rearwardly from said transverse bar to each of said pairs of gangs, said gangs supporting the entire draft-frame.

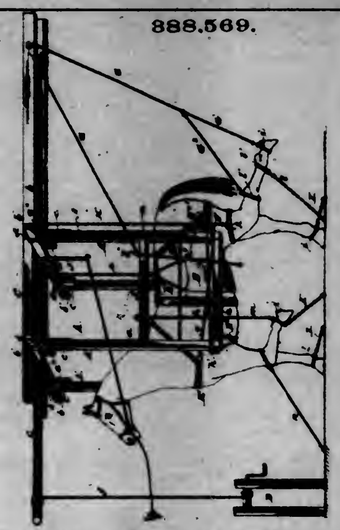
16. The combination, with the cross or draft bar A, of cutter-gangs arranged in pairs on each side of the draft-line, the bars B B, connected with the cross-bar and each gang, the bars C C, connected with the cross-bar and the leading gangs, and connections between the front and rear gangs of each pair.

17. In a harrow without a pole and carrying-wheels, gangs of rocking cutters which support the harrow-frame, in combination with a transverse bar or guard arranged in front of the leading gangs, for the purpose set forth.

18. The combination of the front and rear gangs, the draft-arms B B and C C, connecting devices O O' between the front and rear gangs, and the adjusting and locking pins.

388,568. CHAIN-WRENCH. James Hagmeyer, Long Island City, N. Y. Filed Apr. 19, 1882. Serial No. 271,179. (No model.)

Claim.—1. The combination, with a lever having a head with a recessed under surface and teeth formed at the ends of said recess and a transverse slot above said head, of a chain provided with a keeper, and a plate centrally pivoted in said slot uniting the chain, as and for the purpose specified.



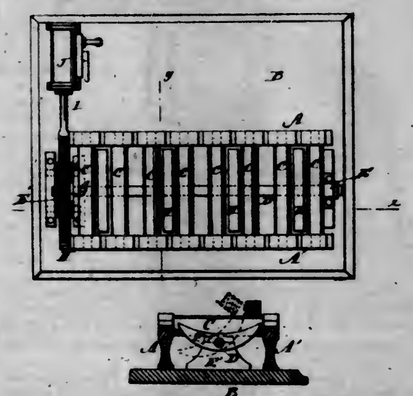
2. In a chain-wrench, the combination, with chain-sections and a uniting pivoted flat link or plate, of a keeper permanently attached to one chain-section, having legs projected at right angles from opposite sides, one essentially in advance of the other, substantially as and for the purpose specified.

388,569. [illegible]-RACK. Samuel M. Hamer, Sidney, Ohio. Filed Apr. 4, 1882. Serial No. 268,616. (No model.)

Claim.—1. The pen or rank consisting of the overhead parallel cross-pieces and the pendent frames, the lower ends of the uprights of which are connected together, and yokes placed astride said cross-pieces, between which the upper ends of the uprights are pivoted, substantially as set forth.

2. The pen or rank consisting of the overhead parallel cross-pieces

388,569.



and the pendent frames, and the yokes or hangers between which the upper ends of the uprights are pivoted, which hangers or yokes are placed astride of and adjustable upon said cross-pieces, substantially as specified.

3. In a shoeing-rack, the pen or rack comprising the side frames, with their uprights beveled outward and downward and connected to upper cross-bars to swing outward, and provided with stops to prevent the inward swinging beyond a perpendicular plane of the frames, substantially as set forth.

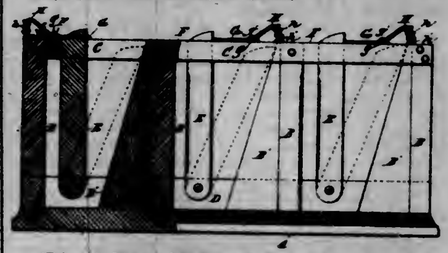
4. In a shoeing-rack, the pen or rack comprising side frames provided at their upper ends with yokes fitted astride of upper cross-bars, said cross-bars having series of adjusting apertures or perforations near their ends, and pins entering said apertures, substantially as specified.

388,570. INGOT-MANIPULATOR. Orlando P. Mason, Bellaire, Ohio. Filed July 11, 1888. Serial No. 279,805. (No model.)

Claim.—1. The combination, with the table formed of the rollers C, of the shaft D, provided with cross-arms F, adapted to swing upward between the rollers, substantially as specified.

2. The combination, with the rollers C, forming the table, of the shaft D, the arms F, carried by the shaft and arranged to extend upward between the rollers, and rack and pinion mechanism for turning the shaft D, substantially as specified.

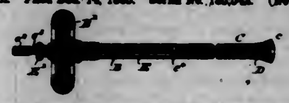
3. The combination, with the rollers C, forming the table, of the shaft D, the arms F, carried by the shaft and arranged to extend upward between the rollers, rack and pinion mechanism for turning the shaft D, and the steam or hydraulic cylinder F for moving the rack, substantially as specified.



388,571. FOLDING FIRE-SCREEN. James H. McElhose, Danville, Ill. Filed Feb. 24, 1888. Serial No. 265,171. (No model.)

Claim.—1. In a blower for fire-places, the combination of two series of plates arranged to overlap each other, a central strip pivoted to the overlapping ends of the plates, and strips pivotally connected with the outer ends of the series of plates, substantially as described.

2. In a fire-blower, the combination of the parallel plates a a' a^2 and b b' b^2 b^3, the strip A, the pivotal rivets c c' c^2 c^3, connecting the plates with the strip A, and the strips B B', provided with lateral hooks and pivotally connected with the outer ends of the series of plates, substantially as described.



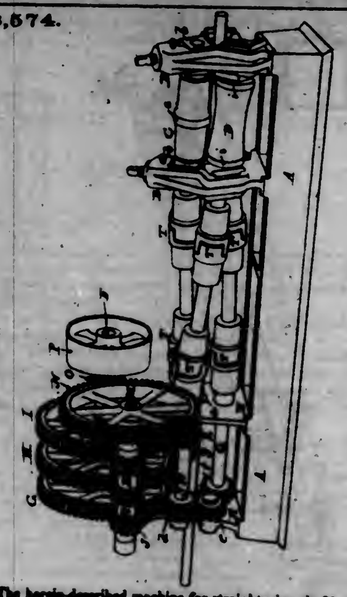
388,572. STANCHION. Henry C. Myers, Stafford, N. Y. Filed May 15, 1888. Serial No. 274,013. (Model.)

Claim.—1. The combination, with the supporting-frame having the upper beams, C, and lower beam, D, of the swinging stanchion E, the locking-bail G, having the offsets g, inclined stem H, and downward spring-supporting lever, the spiral spring h, the spring-retaining pin h', and the staples g', substantially as described.

2. The combination, with the supporting-frame having the upper and lower beams and the swinging stanchion, of the stop-block F between the upper beams, and the spring f within said block for opening said stanchion, substantially as described.

388,573. JEWELER'S LATHE-CHUCK. Horace H. Moseley, Elgin, Ill. Filed Dec. 14, 1888. Serial No. 293,542. (No model.)

Claim.—1. The combination, with a hollow split chuck, C, and a hollow chuck-spindle, B, provided with a hand-wheel, of a stop, D, and a longitudinally-adjustable stem, E, attached to the stop, said stem being extended through the hollow spindle to a point exterior to the said spindle and the hand-wheel thereon, substantially as and for the purposes set forth.



2. The combination, with a hollow split chuck, C, of a stop, D, and a longitudinally movable and rotatable stem, E, attached to the stop, and having a screw-threaded part engaged with an interiorly-threaded part connected with the chuck-head, substantially as and for the purpose set forth.

3. The combination, with a hollow split chuck, C, and a hollow chuck-spindle, B, of a stop, D, a longitudinally movable and rotatable stem, E, attached to the stop, and having a guide-collar, e^2, and a screw-threaded portion, e^3, and a nut, F, detachably secured to the outer end of the said spindle, substantially as and for the purpose set forth.

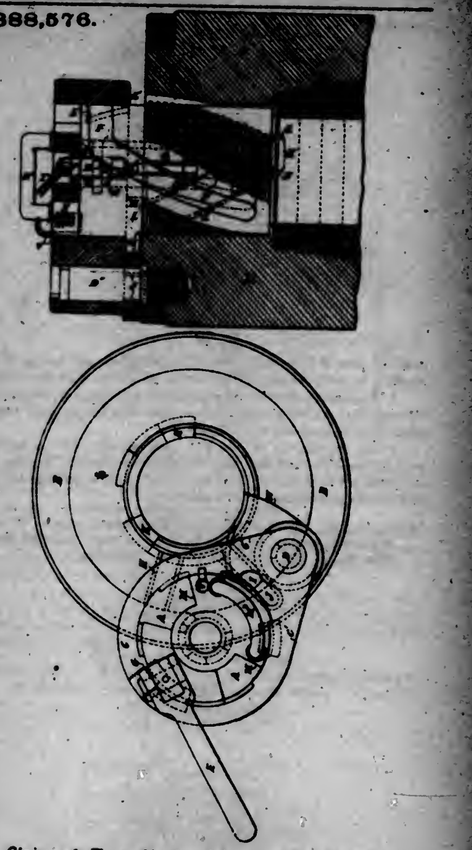
388,574. MACHINE FOR STRAIGHTENING SHAFTING. Walter J. Reinhardt, Cumberland, Md., assignor of one-half to Marvin McKaig, same place. Filed Apr. 4, 1888. Serial No. 269,576. (No model.)

Claim.—1. The combination of a convex roll and two concave rolls arranged about a given line, the convex portion of one roll being opposite the concave portions of the other two rolls and adapted to bend or spring a shaft or like body into the concave faces thereof.

388,574.

2. The herein-described machine for straightening shafting, consisting of convex roll C, concave rolls D D, and gearing, substantially such as shown as described, for imparting rotary motion to said rolls in the same direction, the three rolls being grouped about a common line and each having its axis arranged at an angle to said line.

388,575. SIFTER. Louis M. Hennessy, Frederick, Md. Filed June 14, 1887. Serial No. 241,292. (No model.)



Claim.—1. In a sifter, the combination, with a suitable box provided with horizontal slots in three of its sides, of a sieve within the box, projections attached to three sides of the sieve and lying in said horizontal slots, whereby the sieve may be oscillated as described, said box being also provided with a vertical slot from one of the first-mentioned slots to the edges of the box, whereby one of said projections may be raised from its slot to rotate the sieve about the remaining two projections as an axis, substantially as set forth.

2. In a sifter, the combination, with a suitable box provided with horizontal slots in three of its sides and a vertical slot from the edge of the box to one of said horizontal slots, of a rearwardly-inclined sieve having an open front, projections passing from the sides of the sieve through two of said horizontal slots in two opposite walls of the box, a handle projecting through the rear wall of the sieve through the horizontal slot in the corresponding box-wall, permitting both horizontal and vertical motion to the handle, and an inclined chute adapted to limit the rotation of the sieve about said projections and to receive its contents when it is so rotated.

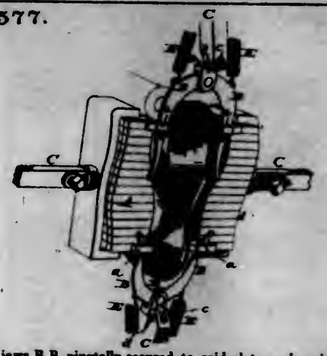
388,576. BREECH MECHANISM FOR GUNS. Thomas Hodgkinson, Westminster, England, assignor to the Hotchkiss Guns and Ammunition Company, (Limited,) same place. Filed June 11, 1888. Serial No. 276,726. (No model.)

388,576.

Claim.—1. The combination of the gun, the breech-block closing its rear end, the segments of screw-threads winding partly around the breech-block, the corresponding segments in the breech of the gun, the carrier-ring by which the breech-block when withdrawn from the gun can be conveyed away to one side, the pin projecting inward from this ring, and the groove in the breech-block, into which the pin enters, formed at one end parallel with the screw-threads and at the other parallel with the edges of the screw-segments.

2. The combination of the gun, the breech-block closing its rear end, the segments of screw-threads winding partly around the breech-block, the corresponding segments in the breech of the gun, the lever-handle for turning the breech-block, the carrier-ring capable of being turned around a pin which is on one side of it and projects backward from the gun, the pin projecting inward from the ring, and the groove in the breech-block, into which this pin enters, formed at one end parallel with the screw-threads and at the other parallel with the edges of the screw-segments.

388,577. LASTING-MACHINE. Thomas O'Brien, Rochester, N. Y., assignor to William S. King, Minneapolis, Minn. Filed Apr. 23, 1888. Serial No. 271,888. (No model.)



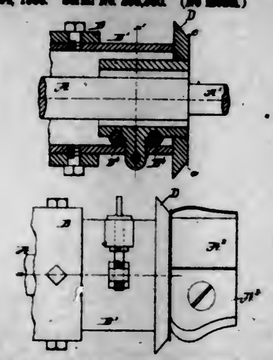
Claim.—1. In a lasting-machine, the combination, with side jaws provided with legs or guides, of end jaws consisting of two independent blades or wipers, B, movable between the legs or guides, and an intermediate plate or block, D, projecting beyond the inner edges of the blades or wipers B, substantially as and for the purpose set forth.

2. In combination with a movable supporting-bar, plate or block D, carried thereby, jaws B B, pivotally attached to said plate or block, and guides arranged at the outer edges of the jaws, substantially as described and shown.

3. In combination with a supporting-bar, plate D, and jaws B B, carried by said bar, and springs extending from the jaws to the bar and serving to draw the jaws apart.

4. In combination with bar C, plate D, pivotally connected with

388,577.



said bar, jaws B B, pivotally secured to said plate, and springs E E, attached to said jaws and serving to draw them away from each other.

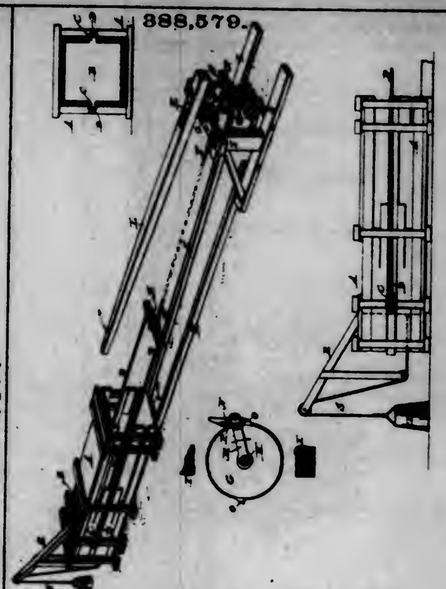
5. In a lasting-machine, in combination with plate D, having its forward edge provided with notches, jaws B B, having their inner edges likewise provided with notches.

6. The combination of jaws A A, provided with lugs *a a*, bar C, plate D, carried by said bar, jaws B B, pivotally attached to plate D, and springs E E, extending from bar C to jaws B B and serving to hold the latter in contact with the lugs *a a*.

388,578. TREAD-GUARD FOR CUTTER-HEADS. JOSEPH L. PARKER, Boston, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed Mar. 24, 1888. Serial No. 268,202. (No model.)

Claim.—1. The combination, with a rotary cutter and its shaft, of a tread-guard or rest and an independent race or support therefor, made adjustable at right angles to the axis of the rotary cutter, whereby the said guard or rest may be placed in proper working position with relation to the said cutter, substantially as described.

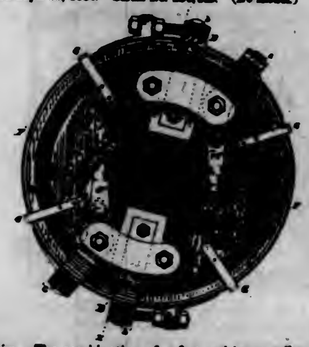
2. The combination, with a rotary cutter, its shaft, and the tread-guard or rest, of a race or support therefor, the stock of the cutter and the guard or rest being connected by a stud-and-slot connection, substantially as and for the purpose described.



3. The combination, with a rotary cutter, its shaft, and tread-guard or rest, of the race or support therefor, with means for adjusting the said race or support eccentrically with relation to the said cutter, substantially as described.

388,579. BALING-PRESS. CHARLES PETERSON, Maple Plain, Minn. Filed Dec. 22, 1887. Serial No. 258,716. (No model.)

Claim.—1. In a baling-press, and in combination with a suitable supporting-frame and baling-chamber, the reciprocating follower, the weighted retracting-cord connected to said follower, the winding-drum, and the chain or cable connecting the same with the follower, the shaft provided with a sweep and with an arm, M, the dog attached to said arm and arranged to engage the drum, and a trip device automatically releasing said dog, substantially as shown.

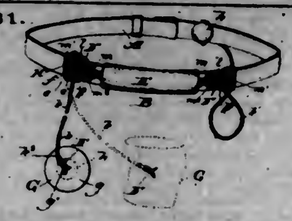


2. In a continuous baling-press, the combination of the open-ended bale-chamber having the feed-opening at its top, the reciprocating follower, the weighted retracting-cord connected to said follower, the side rods, D, also connected to the follower, the chain F, connected to said rods, the winding-drum connected with the chain, the rotary sweep and its arm, an intermediate dog connecting the arm and drum, and a stationary device acting upon the dog to trip the same and release the drum during each revolution.

388,579.

3. In a continuous baling-press, the open-ended bale-chamber A, having the feed-opening in its top, the reciprocating follower therein, the side rods, D, extending from the follower toward and beyond the delivery end of the chamber, and a winding mechanism connected with said rods, whereby the bales issue from the delivery end of the bale-chamber in the direction of the winding mechanism.

388,580. FRICTION-CLUTCH. SYLVESTER H. PITKIN, Akron, Ohio. Filed Sept. 22, 1887. Serial No. 250,445. (No model.)



Claim.—The combination of a fast and loose pulley, one of said pulleys being provided with a flange and the other with two parallel bands which encircle said flange, two fixed arms carrying wrist-pins, two pivoted levers carrying wrist-pins, the sliding sleeve and the links connecting said sliding sleeve to the pivoted levers, the two ends of one of said bands being attached, respectively, to the wrist-pin carried by the fixed arm and the wrist-pin carried by the pivoted lever mounted on one of said pulleys, and the two ends of the other band being respectively attached to the wrist-pin carried by the fixed arm and the wrist-pin carried by the pivoted lever mounted on the same pulley, the fixed arm and pivoted lever of one band being secured to the pulley diametrically opposite the fixed arm and pivoted lever of the other band, the inner ends of said levers having universal bearings in links pivoted to the sliding sleeve on the shaft, said levers being arranged to simultaneously either draw said bands upon the pulley-flange or to release them therefrom, substantially as described.

388,581. ELECTRIC BELT. HARRY P. PRATT, Chicago, Ill., assignor to The Pratt Electro Therapeutic Supply Company, same place. Filed Apr. 19, 1888. Serial No. 270,191. (No model.)

Claim.—1. In an electric belt, the combination of a girdle portion.

388,581.

A, a longitudinally-expansible and transversely-compressible battery, B, comprising cells C, flexibly connected together, and electrodes connected by suitable conductors with the opposite poles of the battery, substantially as described.

2. In an electric belt, the combination of a girdle portion, A, a longitudinally-expansible and transversely-compressible battery, B, comprising cells C, flexibly connected together, clasps *m*, attached to the opposite poles of the battery, buckles *m'* on the girdle portion, elastic bands *l*, connecting the clasps *m* and buckles, and electrodes connected by suitable conductors with the clasps *m*, substantially as described.

3. In an electric belt, the battery F, comprising, in combination, cells C, composed each of an element, *r*, surrounded by absorbent material, *q*, to contain the exciting-liquid, and an element, *p*, of substantially the oval form shown, and provided with the extension *o*, links *n*, connecting the cells from opposite elements, and end links, *n*, having eyes *n²*, substantially as described.

4. In an electric belt, the battery B, comprising, in combination, cells C, composed each of an element, *r*, surrounded by absorbent material, *q*, to contain the exciting-liquid, and an element, *p*, of substantially the oval form shown, and provided with the extension *o*, links *n*, connecting the cells from opposite elements, rings *n'* on some or all of the links, and end links, *n*, having eyes *n²*, substantially as described.

5. In an electric belt, the combination, with the girdle portion A, of a battery, B, inclosed in a moisture-proof case and having its terminals projecting from opposite ends of the said case and connected with the girdle portion, a sliding case, E, on the girdle portion, disconnected from the said moisture-proof case, whereby the case E may be shifted to cover or uncover the case containing the battery, and electrodes connected by suitable conductors with the opposite poles of the battery, substantially as described.

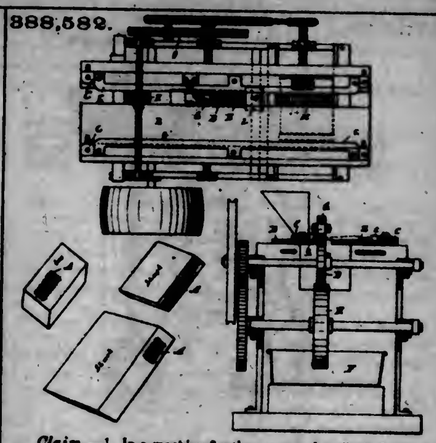
6. In an electric belt, the combination, with the battery, of a mechanically-operated circuit breaker or interrupter, substantially as described.

7. In an electric belt, the combination, with the battery, of a circuit breaker or interrupter, H, comprising a housing, *f*, containing loosely conducting material, *f'*, and contacts *e*, extending into the housing, substantially as described.

8. In an electric belt, the combination, with the battery, of a circuit breaker or interrupter, H, comprising a housing, *f*, containing loosely conducting material, *f'*, and contacts *e*, extending into the housing and provided with eyes *d'*, substantially as described.

9. In an electric belt or the like, the combination, with the battery, of a conductor to which an electrode is connected, and a clamp, F, at an end of the conductor, formed with spring-arms *i'*, having hooks *i²* at their extremities, extending outwardly in opposite directions, substantially as described.

10. In an electric belt or the like, the combination, with the battery, of a conductor to which an electrode is connected, and a clamp, F, at the end of the conductor, formed with a coil, *i*, and spring-arms *i'*, having hooks *i²* at their extremities, extending outwardly in opposite directions, substantially as described.



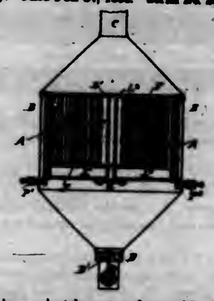
11. In an electric belt or the like, the combination, with the battery, of an electrode, G, connected with a pole of the battery by a suitable conductor and self-supporting on the part of the body to which it is applied, substantially as described.

12. In an electric belt or the like, the combination, with the battery, of an adhesive electrode, G, connected with a pole of the battery by a suitable conductor, substantially as described.

13. In an electric belt or the like, the combination, with the battery, of an adhesive electrode, G, comprising a plaster having a metallic plate on its adhesive surface and an eye, *g'*, extending from the said plate through the plaster, and a conductor connected at one end with a pole of the battery, and carrying at its opposite end a clamp, F, formed with spring-arms *i*, terminating in hooks *i²*, inserted into the eye *g'*, substantially as described.

388,582. MACHINE FOR SAWING MATCH-BOXES. CHARLES H. PERKINS and HENRY W. WHALEN, Detroit, Mich., assignors to the Diamond Match Company, New Haven, Conn. Filed May 13, 1887. Serial No. 238,013. (No model.)

388,582.



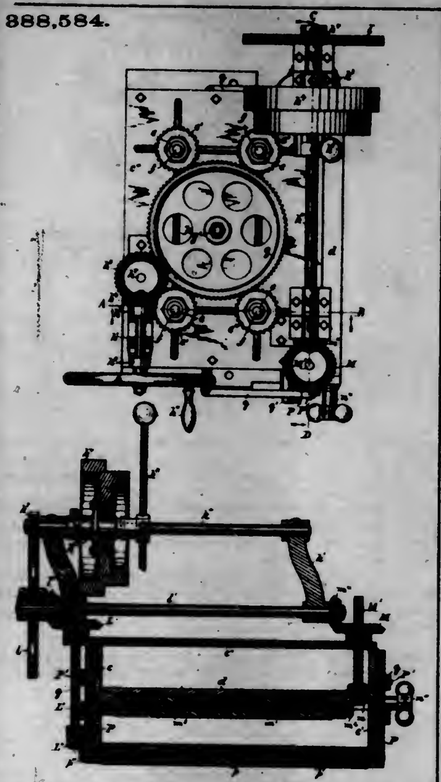
Claim.—1. In a machine for the purpose described, the combination, with the giving and sanding devices, of the bed B, formed in two parts, and the guides adjustably secured to said bed, substantially as and for the purpose specified.

2. In a machine for the purpose described, the combination, with the giving and sanding devices, of the bed B, the parallel guides, and the spring-guides *c*, secured to said parallel guides, substantially as and for the purpose specified.

3. In a machine for the purpose described, the combination, with the giving and sanding devices, of the bed B, the adjustable parallel guides, and the spring-guides *c*, secured to said parallel guides, substantially as and for the purpose specified.

388,583. ELECTRIC MOTOR. KARL RAAB, Kaiserslautern, Bavaria, Germany. Filed Feb. 27, 1888. Serial No. 265,655. (No model.)

Claim.—1. In an electric motor, the combination of an inclosing-case, two spiral coils of German silver encircling each other, with their similar ends connected together, and with their similar opposite ends connected to the line-wire, so that the current must pass through and heat the coils, and an anemometer operated by the current of air formed by the heat of the coils within the case.



2. In an electric motor, the combination of an inclosing-case, two spiral coils of small-resistance material encircling each other and connected together and to the line-wire, so that the current must pass through and heat the said coils, and an anemometer operated by the air-current induced by the said heated coils.

3. In an electric motor, the combination of an inclosing-case, two spiral coils of small-resistance material encircling each other and connected together and to the line-wire, so that the current must pass through and heat the said coils, a shunt of conducting material having greater resistance than the spiral coils, and also included in the circuit, and an anemometer operated by the current induced by the said heated coils, substantially as and for the purpose set forth.

388,584. GAGE AND FEED ATTACHMENT FOR RUBE PLANING-MACHINES. SAMUEL S. RAYMOND and SYLVESTER H. ROBERTS, Manchester, N. H., and WILBUR W. GARDY, Lowell, Mass. Filed Apr. 19, 1888. Serial No. 271,143. (No model.)

Claim.—1. The frame *c d d'*, having journaled in its top portion the internally-screw-threaded bushings *e e*, provided with pinions *d d*, combined with the vertically-adjustable gage *d' d'*, the screw-shafts *f f*,

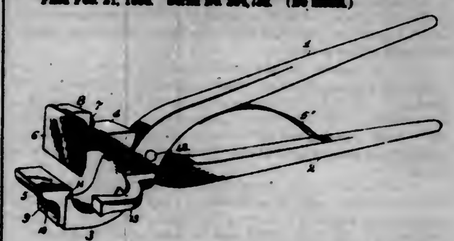
888,584.

secured to said gage and screwed through the bushings *c c*, and means for operating said pinions and screw-shafts, as and for the purpose set forth.

2. The frame *c c' c'*, having the bushings *c c* journaled in its top portion and provided with connected pinions *d d*, as described, combined with the set-screws *f f*, and the vertically-adjustable gage *d d'* and its positively-actuated feed-roller m^2, as and for the purpose set forth.

3. The frame *c c' c'* and the vertically-adjustable gage *d d'*, in combination with the positively-operated feed-roller m^2, journaled in said gage, and the scraper N, pivoted to said gage and having its free end bearing on the said feed-roller, as and for the purpose set forth.

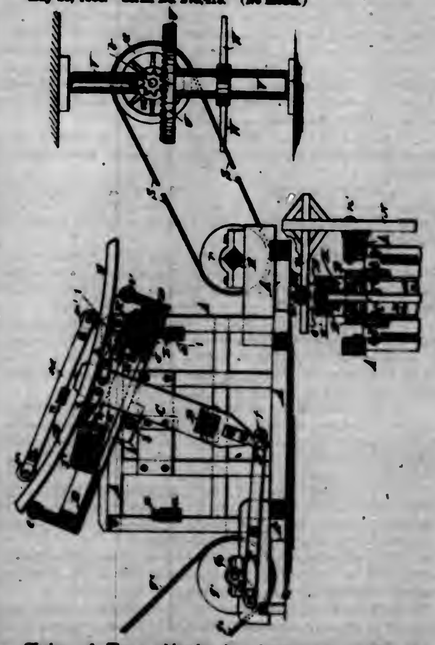
4. The frame *c c' c'* and the gage *d d'*, vertically adjustable relative to said frame, combined with the positively-operated feed-roller m^2, journaled in the said gage, the rotary cutter-shaft *a*, and the positively-operated and vertically-yielding lower feed-roller, *p*, arranged below the feed-roller m^2 and in front of the rotary cutter-shaft *a*, as and for the purpose set forth.



5. In combination with the rotary beam planer-knives *a' a'* and the table-tops *b b'*, the detachable frame *c c' c'*, having vertically-adjustable gage *d d'*, arranged as described, and the spring-pressed anti-friction roller *i'*, and positively-operated feed-roller m^2, journaled in said gage, and the vertically-yielding and positively-operated feed-roller *p*, arranged below the roller m^2 and in front of the beam planer-tool, substantially as and for the purpose set forth.

6. The frame *c c' c'* and the vertically-adjustable gage *d d'*, having the positively-operated feed-roller m^2, in combination with the vertically-yielding and positively-operated lower feed-roller, *p*, and mechanism for imparting a rotary motion to it, consisting of the rotary shaft *l'*, having pinion *l'* secured to it, the gear L, journaled in the frame portion *c'*, and the shaft L', affixed to said gear and having secured to its lower end the pinion L', meshing in the pinion *p'* on the lower roller, *p*, substantially as and for the purpose set forth.

7. The frame *c c' c'* and the vertically-adjustable gage *d d'*, having screw-threaded spindles *f f f f*, adapted to work in screw-threaded hubs on the pinions *d d d d*, in combination with mechanism for operating said gage and its pinions, consisting of the crank or handle *k'* and shaft *k'*, secured to it, the pinion k^2, secured to said shaft and meshing in the loose gear k^3, and the pinion k^4, secured to gear k^3 and meshing in the gear *g*, that meshes in the teeth of the respective pinions *d d d d*, substantially as and for the purpose set forth.



8. The frame *c c' c'* and the vertically-adjustable gage *d d'*, having the positively-operated upper feed-roller, m^2, journaled in it, as described, in combination with the vertically-yielding and positively-operated lower feed-roller, *p*, journaled in the vertically-movable bars or bearings P P, as described, and the levers *q q*, connected to said bearings and having their ends connected to the frame of the device by means of the springs *q' q'*, substantially as and for the purpose set forth.

888,585. HOOF-PARER. ROBERT P. EMLEY, Bloomington, W. Va. Filed Feb. 21, 1888. Serial No. 264,732. (No model.)

Claim.—A hoof-parer consisting in the pivoted handles 1 2, having reversely-curved ends 3 and 4, the former of which has a bottom on its outer end and a projection, 12, on its outer side extending outwardly and forwardly to a point approximately in line with the inner edge of the bottom, and the knife 6 on the front face of the end 4, substantially as set forth.

888,586. HORSE-POWER. ALLEN SANDERS, Victoria, Tex. Filed May 30, 1888. Serial No. 275,419. (No model.)

Claim.—1. The combination, in a horse-power machine, of a frame, a tilting carriage thereon, a lever fulcrumed on the frame, connections from said lever to machinery to be driven thereby, a weight box or boxes held to the lever and traveling on the carriage during its tilting movement, and mechanism for rocking the lever, and thereby tilting the carriage, substantially as described, for the purpose set forth.

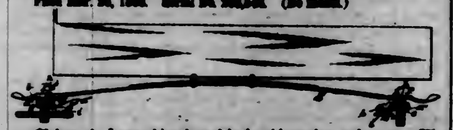
2. The combination, in a horse-power machine, of a frame, a tilting carriage thereon, a lever fulcrumed on the frame, connections from said lever to machinery to be driven thereby, a weight box or boxes held to the lever and traveling on the carriage during its tilting move-

ment, a longitudinally-ranging head-bar on the lever tilting the carriage as the lever is rocked, a lever fulcrumed on the frame and carrying a cross-head resting on the head-bar of the carriage-tilting lever, and mechanism connected to the lever having the cross-head for operating it from an adjacent horse-power or other motor, substantially as described, for the purposes set forth.

3. The combination, in a horse-power machine, of a frame, a tilting carriage, B, thereon, provided with a floor-slot, *b'*, a lever, C, fulcrumed on the frame and projecting through said slot, two boxes, H I, carrying weights and held to the lever C to travel on the carriage B, connections from the lever C to machinery to be driven, and mechanism for rocking the lever and tilting the carriage, substantially as herein set forth.

4. The combination, in a horse-power machine, of a frame, a tilting carriage, B, thereon provided with a floor-slot, *b'*, two boxes, H I, carrying weights and held to the lever C, to travel on the carriage B, a pitman, F, connected to the lever and to a cranked driving-shaft, a head-bar, E, on the lever, and a lever, N, fulcrumed to the frame and provided with a cross-head, M, operating on the head-bar E, for rocking the lever C and tilting the weight-box carriage, substantially as herein set forth.

5. The combination, in a horse-power machine, of a frame, a tilting carriage thereon, a lever fulcrumed on the frame, connections from said lever to machinery to be driven, a weight box or boxes held to the lever and traveling on the carriage during its tilting movements, a head-bar, E, on the lever, a lever, N, fulcrumed on the frame and provided with a cross-head, M, operating on the head-bar E, and a pitman, O, connected to the lever N and to power mechanism driven from an adjacent motor, substantially as herein set forth.



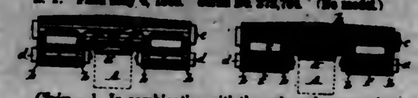
6. The combination, in a horse-power machine, of a frame, a tilting carriage thereon provided with anti-friction wheels *c c'* at opposite ends, a lever, C, fulcrumed to the frame and connected to machinery to be driven, and provided with a curved head-bar, E, resting on the carriage-wheels *c c'* to tilt the carriage, substantially as herein set forth.

7. The combination, in a horse-power machine, of a frame, a tilting carriage thereon, a lever, C, fulcrumed to the frame and connected to machinery to be driven, a head-bar, E, on said lever resting on the carriage to tilt it as the lever is rocked, a lever, N, fulcrumed on the frame and operated from an adjacent power, a cross-head, M, on said lever N, provided with anti-friction wheels *m m'*, resting on the head-bar of the lever C, substantially as herein set forth.

8. The combination, in a horse-power machine, of a frame, a tilting carriage thereon, a lever fulcrumed on the frame, connections from said lever to machinery to be driven, a weight box or boxes held to the lever and traveling on the carriage as it is tilted, mechanism for rocking the lever and tilting the carriage, and spring-buffers on the frame relieving the shock of the tilting movements of the carriage, substantially as herein set forth.

9. The combination, in a horse-power machine, of a frame, a tilting carriage thereon, a lever fulcrumed on the frame, connections from said lever to machinery to be driven, a weight box or boxes connected to the lever and mounted on wheels and traveling on the carriage during its tilting movement, and mechanism rocking the lever and tilting the carriage, substantially as herein set forth.

888,587. VEHICLE-SPRING. ARTHUR SHERMAN, Cazenia, N. Y. Filed Mar. 26, 1888. Serial No. 268,546. (No model.)



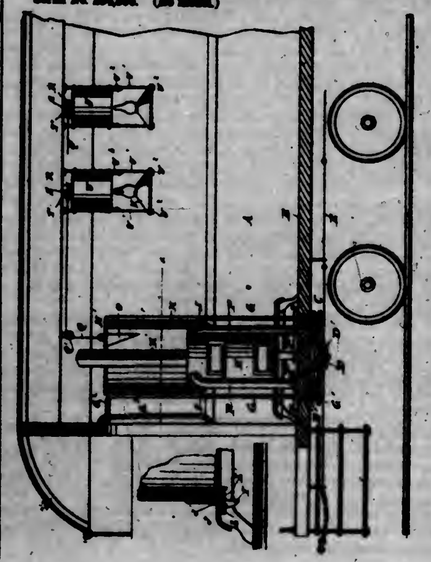
Claim.—1. In combination with the side spring and cross-spring, the shackle-eye *e*, formed on the end of the cross-spring, the saddle *a*, riding on said eye and formed with the perforated segmental rocker-seat *c* on top and with pendent perforated ears *c' c'* at the ends of the eye, the coupling-bolt A, extending through said ears and intervening eye, the plate P, secured to the end of the side spring and formed with the concave bearing *d*, riding on the seat *c*, and provided with the perforated ears *f f*, and the coupling-bolt A, passing through said ears and intervening rocker-seat, substantially as described and shown.

2. In combination with the side spring and cross-spring, the shackle-eye *e*, formed on the end of the cross-spring, the saddle *a*, provided with perforated ears *c' c'*, the cushion *i*, interposed between the end of the shackle-eye *e* and adjacent ear *c'*, the coupling-bolt A, extending through said ears and intervening shackle-eye and cushion, and the plate P, attached to the end of the side spring and coupled to the saddle *a*, substantially as set forth and shown.

3. In combination with the side spring, cross-spring, and the saddle *a*, connected to the end of said cross-spring and formed with the rocker-seat *c*, the plate P, formed with the recessed seat *c* for the end of the side spring, and formed, also, with the concave bearing *d*, riding on the seat *c*, and with perforated ears *f f*, and the coupling-bolt A, passing through said ears and intervening rocker-seat, substantially as described and shown.

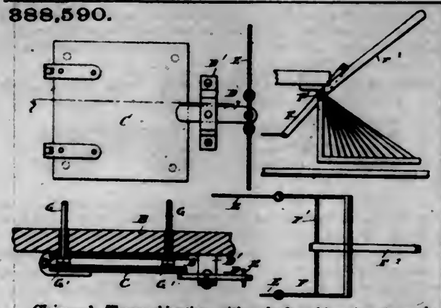
888,588. VEHICLE-SPRING HANGER. ARTHUR SHERMAN, Cazenia, N. Y. Filed May 4, 1888. Serial No. 272,704. (No model.)

Claim.—1. In combination with the axle and cross-springs at opposite sides thereof, saddles rigidly secured to the top of the end portions of the axle and provided with lugs perforated at right angles to the axle, hangers riding on said lugs, bolts extending completely through the length of the hangers and through the aforesaid lugs, and couplings connecting the cross-springs to said hangers, as set forth and shown.



2. In combination with the axle and cross-springs at opposite sides thereof, the saddles *a a*, secured to the top of the end portions of the axle and formed with the perforated lugs *a' a'*, and the hangers *h h*, riding on said lugs and each formed with the central eye, *e*, and pendent ears *b b* at its ends, the bolt *c*, extending completely through the length of the hanger and through the aforesaid lugs, and bolts *d' d'*, passing through the pendent portions of the ears and connecting thereto the eyes *f f* of the springs, substantially as described and shown.

888,589. ART OF ORNAMENTING CARDS. CHARLES SHUMANN, Brooklyn, N. Y. Filed Nov. 29, 1887. Serial No. 255,412. (No model.)



Claim.—The method herein described of ornamenting cards in relief, which consists in placing a sheet of ornamental paper coated with adhesive material in a die having raised letters or ornaments with sharp and raised cutting-edges, then placing the sheet to be ornamented upon the coated surface of the ornamental paper and subjecting both to a heavy pressure, thus cutting and sticking the latter to the sheet all at once and the same operation, as described.

888,590. SAFETY ATTACHMENT FOR CAR-HEATERS AND CAR-LAMPS. GEORGE P. SHAVER, Dover, N. H. Filed Apr. 12, 1887. Serial No. 234,692. (No model.)

388,590.

Claim.—1. The combination, with a platform hinged to the under side of the car-bottom and a catch for holding said platform in a horizontal position, of rods supported on said platform and passing through the base of the car-heater, and a hood supported by said rods and adapted to inclose the car-heater, substantially as shown and described.

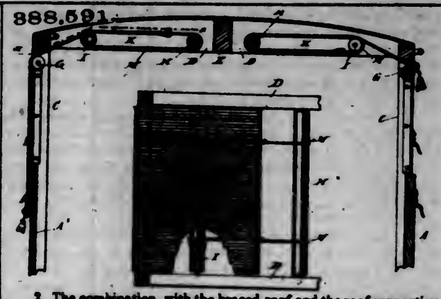
2. The combination, with a platform hinged to the under side of the car-bottom and a catch for holding said platform in a horizontal position, of rods secured on said platform and passing through the base of the car-heater, a hood supported by said rods and adapted to inclose the car-heater, and catches on the hood for locking said hood to the base of the car-heater, as set forth.

3. The combination, with a platform hinged to the under side of the car-bottom and a pivoted catch engaging said platform to hold it in a horizontal position, of links or chains connected with said pivoted catch, and a lever fulcrumed on the cow-catcher of the locomotive and extending at an angle, said lever being connected with said links or chains connected with said catch, substantially as shown and described.

4. The combination, with a car-heater and the base supporting said car-heater and having apertures, of rods passing through said apertures and a hood secured to said rods and adapted to slide over said car-heater, substantially as shown and described.

5. The combination, with a car-heater and the base supporting said car-heater and having apertures, of rods passing through said apertures and a hood secured to said rods and adapted to slide over said car-heater, and catches for locking said hood to said base, substantially as shown and described.

6. The combination, with a car-heater provided on the inside of its top with guides, a slide held in said guides and adapted to close the chimney-opening, and a base supporting said car-heater, of rods passing through said base, a hood supported by said rods and adapted to fit over said car-heater, and a wedge fastened to the inner side of the top of the hood and adapted to operate said slide in the top of the car-heater, substantially as shown and described.



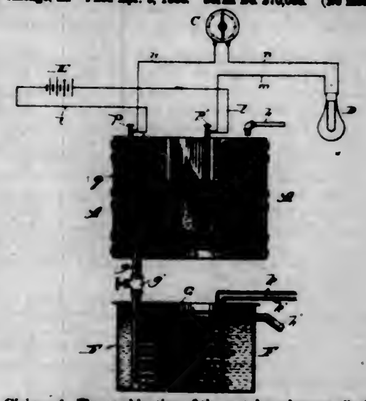
7. The combination, with rods secured to the roof of a car and hooks fastened to the lower ends of said rods, of a lamp adapted to slide with its base on said rods, being supported on said hooks of the rods, a hood adapted to slide on said rods and fitting over said lamp, and spring-catches secured to said hood and adapted to lock said lamp to said hood, substantially as shown and described.

8. The combination of rods secured to the roof of a car, a lamp supported by and fitted to slide on the said rods, and a hood suspended from the top of the car and guided on the said rods when detached from the top of the car, substantially as herein shown and described.

9. The combination, with the platform C, pivoted to the under side of the car-bottom, and means for holding said platform in position, of the rods G, supported on said platform C, the hood H, supported by said rods G and adapted to fit over the car-heater, the rope Q, connected with the top of said hood H, the spring-pin R, secured to said rope Q, the slotted arm T, and the hood U, supported by said pin R and adapted to slide over the lamp V, substantially as shown and described.

10. The combination, with a hood, H, and means for supporting the same, of the lamp V, suspended from the top of the car, the rope Q, connected to the hood, the spring-pin R, secured to the rope, and the hood U, supported by the pin R and adapted to slide over the lamp V and to be locked thereto, substantially as herein shown and described.

388,591. VESTIBULE-TOP CURTAIN. John H. Brabaker, Brooklyn, N. Y. Filed Mar. 8, 1888. Serial No. 266,880. (No model.)



Claim.—1. The combination, with the braced roof and the roof-supporting posts forming the open sides of a vehicle, of a guide-roller mounted across the top of a side opening, a spring shade-roller journaled to and beneath the braced roof, and a curtain running over the guide-roller and arranged to be rolled up under the roof by the spring-roller, substantially as described.

2. The combination, with the braced roof and the roof-supporting posts forming the open sides of the vehicle, of a guide-roller mounted across the top of a side opening, another guide-roller mounted beneath the middle part of the roof, a spring-roller mounted beneath the roof in front of the latter guide-roller, a curtain passed around the two guide-rollers, and cords connecting the curtain to the spring-winding roller, substantially as described as described.

3. The combination, with the roof of a vehicle and the roof-supporting posts, of a guide-roller journaled between the posts a short distance below the cross-braces of the top, a spring-roller journaled beneath the top, and a curtain connected to said spring-roller and passing between the guide-roller and the cross-brace, substantially as herein shown and described.

388,592. ICE OR REFRIGERATING MACHINE. John R. Barse, Chicago, Ill. Filed Apr. 9, 1888. Serial No. 270,098. (No model.)

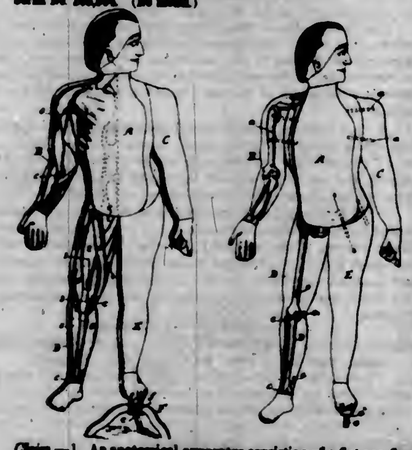
Claim.—1. The combination of the metal condenser-coil of an ice or refrigerating machine and positive and negative electrodes connected by a suitable conductor, whereby water containing, inherently, a substance having a corroding effect on metal, passed into contact with the electrodes, is prevented from corroding the coil, substantially as described.

2. The combination of the metal condenser-coil of an ice or refrigerating machine, a vessel or chamber containing positive and negative electrodes connected by a suitable conductor, and water-conducting mains leading to and from the said vessel, whereby water containing, inherently, a substance having a corroding effect on metal, passed through the said vessel in contact with the electrodes, is prevented from corroding the coil, substantially as described.

3. The combination of the metal condenser-coil of an ice or refrigerating machine, a vessel containing positive and negative electrodes connected by a suitable conductor, water-conducting mains leading to and from the said vessel, whereby water containing, inherently, a substance having a corroding effect on metal, passed through the said vessel in contact with the electrodes, is prevented from corroding the coil, and an extraneous auxiliary battery, E, connected with the electrodes, substantially as described.

4. The combination of the metal condenser-coil of an ice or refrigerating machine, a vessel containing positive and negative electrodes connected by a suitable conductor leading beyond the vessel, a device such as the incandescent electric lamp D in the circuit, and water-conducting mains leading to and from the said vessel, whereby water containing, inherently, a substance having a corroding effect on metal, passed through the said vessel in contact with the electrodes, generates electricity utilized at the device D, and is prevented from corroding the coil, substantially as described.

5. The combination of the metal condenser-coil of an ice or refrigerating machine, a vessel containing positive and negative electrodes connected by a suitable conductor leading beyond the vessel, a device such as the incandescent electric lamp D and an indicator, C, in the circuit, and water-conducting mains leading to and from the said vessel, whereby water containing, inherently, a substance having a corroding effect on metal, passed through the said vessel in contact with the electrodes, generates electricity utilized at the device D, and the condition of which is indicated at the indicator C, and is prevented from corroding the coil, substantially as described.



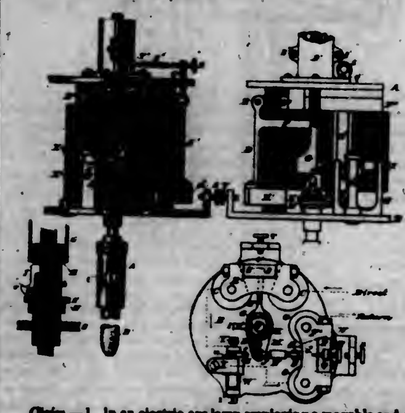
6. The combination of the metal condenser-coil of an ice or refrigerating machine, a vessel containing positive and negative electrodes connected by a suitable conductor leading beyond the vessel, a device such as the incandescent electric lamp D and an indicator, C, in the circuit, an extraneous auxiliary battery, E, connected with the electrodes, and water-conducting mains leading to and from the said vessel, whereby water containing, inherently, a substance having a corroding effect on metal, passed through said vessel in contact with the electrodes, generates electricity utilized at the device D, and the condition of which is indicated at the indicator C, and is prevented from corroding the coil, substantially as described.

7. The combination of the condenser of an ice or refrigerating machine, comprising a tank, F, provided with water-conducting mains leading to and from it, and containing a metal coil, G, and an electrode, e, positive to the metal of the coil contained in the tank and connected with the coil by a suitable conductor, whereby water containing, inherently, a substance having a corroding effect on metal, passed through the tank in contact with the coil and electrode e, is prevented from corroding the coil, substantially as described.

8. The combination of the condenser of an ice or refrigerating machine, comprising a tank, F, provided with water-conducting mains leading to and from it, and containing a metal coil, G, and an electrode, e, positive to the metal of the coil contained in the tank, conductors n and m, leading, respectively, from the coil and the electrode e, and a device such as the incandescent electric lamp D in the circuit, whereby water containing, inherently, a substance having a corroding effect on metal, passed through the tank in contact with the coil and electrode e, generates electricity utilized at the device D, and is prevented from corroding the coil, substantially as described.

9. The combination of the condenser of an ice or refrigerating machine, comprising a tank, F, provided with water-conducting mains leading to and from it, and a metal coil, G, a porous vessel, B, of insulating material in the tank surrounded by the coil, and an electrode, e, electro-positive to the coil in the vessel B, and connected by a suitable conductor with the coil, whereby water containing, inherently, a substance having a corroding effect on metal, passed through the tank in contact with the coil and electrode e, is prevented from corroding the coil, substantially as described.

388,593. ANATOMICAL APPARATUS. Elias Smith, Peoria, Ill., assignor of one-half to Fred Klaible, same place. Filed Feb. 28, 1888. Serial No. 265,804. (No model.)



Claim.—1. An anatomical apparatus consisting of a flat non-flexible base or frame having the outline of the human body and a plurality of thin plates having the form of the various organs, muscles, and parts of the human body, said plates being movably attached upon said base.

2. An anatomical apparatus consisting of a flat non-flexible base or frame, a plurality of thin plates having the form of the muscles, organs, or parts of the body, and pins or hooks inserted in the base or frame for removably securing said plates in position upon said base or frame.

3. An anatomical apparatus consisting of a base or backing having the outline of the human body, and provided with a plurality of plates and with a pivot at its lower end, in combination with a tripod or equivalent support having a socket or hole to receive said pivot, whereby said apparatus is sustained in an upright position and is made capable of rotation on said tripod.

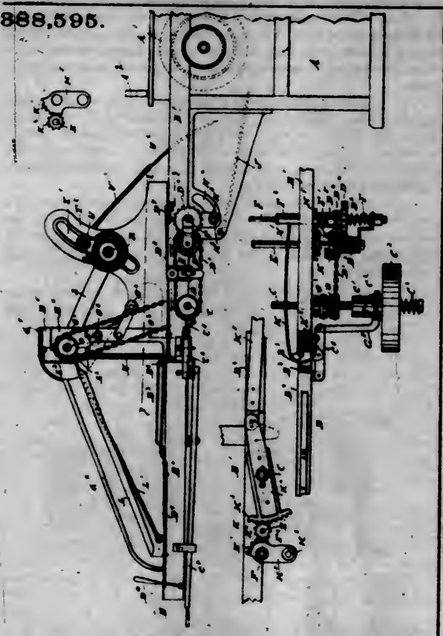
4. A base or backing for anatomical apparatus, consisting of a flat non-flexible base having the outline of the human body and divided into parts, and means, substantially as described, for removably uniting said parts, so that the same may be separated for convenience in packing.

388,594. ELECTRIC-ARC LAMP. Lewis W. Sperry, Hewlett Point, and Frederick P. Jaquith, Hewlett, N. Y. Filed Oct. 12, 1888. Serial No. 178,003. (No model.)

Claim.—1. In an electric-arc lamp employing a movable and a stationary carbon, a holder for the movable carbon provided with a screw-threaded stem, a rotating sectional nut with which such stem engages, said nut being in combination with a concentric ratchet, and a pawl actuated by the movement of the armature of a shunt-magnet, when constructed and arranged to operate substantially in the manner set forth.

2. In an electric-arc lamp, a vertically-movable non-rotating carbon-holder having a screw-threaded stem, a hollow cylindrical nut-carrier provided with a concentric ratchet, and a sectional nut adapted to engage with the thread of the screw-stem of the carbon-holder which passes through the center of said carrier, and about which said carrier revolves, a concentric collar for supporting said carrier, which collar is connected with or attached to the armature of the main magnets, substantially as shown, whereby a rising-and-falling movement may be imparted thereto, in combination with a reciprocating or oscillating arm carrying a pawl which actuates said ratchet by means of the vibrations of the armature of a shunt-magnet with which said arm is connected, substantially as shown, and for the purposes set forth.

3. The combination of the carbon-holder having stem J and guide-lugs F' F', with the tubular guideway D', having the parallel ribs F' F', which co-operate with lugs F' F', substantially in the manner described, and for the purposes set forth.



4. In a regulator for arc lamps, the combination of the magnets C C, shunt-coils O O, swinging pendulum-rods N' and D, armatures H' and d, stirrup G, collar H, cylinder b, and nut I, cylinder Z, insulating-piece n, and brush X, substantially as set forth.

5. In a regulator for arc lamps, the combination of the magnets C C, swinging rod D, armature H', arm P, stirrup G, collar H, cylinder b, and nut I, provided with thumb-piece d' and screw-threaded carbon-holder, substantially as described.

6. In a regulator for arc lamps, the combination of the magnets C C, shunt-coils O O, swinging pendulum-rods N' and D, armatures H' and d, stirrup G, collar H, cylinder b, and nut I, cylinder Z, insulating-piece n, brush X, crank-pin i, pitman c, and turn-buckle H', substantially as and for the purposes set forth.

388,595. BAND-CUTTER AND FEEDER FOR THRASHING-MACHINES. John H. Swisher, Cartinge, Mo. Filed Oct. 27, 1887. Serial No. 253,262. (No model.)

388,595.

Claim.—1. In a band-cutter and feeder for thrashing-machines, the combination, with endless horizontal slat belts, of a vertical partition held between the said slat belts, a second set of endless slat belts held above the first-named slat belts, a swinging table over which passes the last-named set of slat belts, fixed knives held on the under side of said table at each side of the partition, and pushing prongs or fingers secured to the ends of the slats of the central slat belt of the last-named set of slat belts, substantially as shown and described.

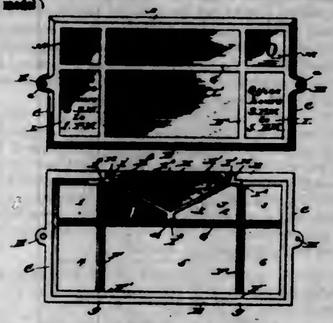
2. In a band-cutter and feeder for thrashing-machines, the combination, with endless slat belts traveling horizontally, of a vertical partition held between said slat belts, an inclined adjustable table held above said slat belts, an endless belt passing over said table and provided on the ends of each slat with a pushing prong or finger, and fixed knives held on the under side of said table alongside the said pushing prongs or fingers, substantially as shown and described.

3. In a band-cutter and feeder for thrashing-machines, the shaft O, carrying the rollers P^2 and P^3, the shaft R, carrying the rollers R^2 and R^3, the arms S, fulcrumed on said shaft O and carrying said shaft R, and the table S', connecting said arms S with each other, in combination with the slat belts P, P', and Q, the pushing-fingers Q', secured to the ends of the slats of the belt Q, each pushing-finger being provided with a foot traveling on said table, and the knives V^3, held on the under side of said table between the slat belts P Q and Q P', substantially as shown and described.

4. The combination, with the power-shaft, the endless feed-belt or carrier operated from said shaft, and a clutch for throwing the same into and out of gear, of the continuously-operated transversely-reciprocating spreader-bar at the delivery end of the belt, and gearing connecting it at all times with the power-shaft, said gearing being unaffected by the action of the said clutch, whereby the spreader will continue to operate after the feed-belt has been stopped, substantially as set forth.

5. The combination of the power-shaft, the horizontal endless feed-belt or carrier operated therefrom, a clutch mechanism for connecting it with and disconnecting it from the power-shaft, an inclined endless belt above the first-named belt and driven continuously from the power-shaft independently of the horizontal belt, with the two continuously-operated transversely-reciprocating spreader-bars at the delivery ends, respectively, of said belts, and having spreading-fingers curved or inclined downwardly, and a table common to both spreaders, the upper spreading-fingers operating across the table in advance of the lower fingers, whereby both spreaders and the upper belt will be operated when the lower feed-belt is disconnected from the power-shaft by means of its clutch mechanism, substantially as set forth.

6. In a band-cutter, the combination, with the endless slatted belt or carrier, the continuously-rotated shaft P at the delivery end of the said belt, a sleeve loose on said shaft, a roller on the sleeve around which the said delivery end of the belt passes, and a clutch-connection between the said continuously-rotated shaft and the sleeve thereon, of links or arms secured to the said sleeve, a grain-spreader bar mounted in said links or arms, and operating-connections between the shaft P and the said spreader-bar for continuously operating it, substantially as set forth.



7. In a band-cutter and feeder for thrashing-machines, the main shaft C, the wide gear D^2, driven continuously therefrom, the shaft F, the sleeve F^2, through which said shaft passes, and provided with a clutch adapted to be engaged with or disengaged from a clutch, D^3, held on said shaft, the gear D^4, meshing with the said wide gear and connected to the said clutch D^3 on the shaft F, the roller G', secured on said sleeve, and the endless slat belts G, passing over said roller, the shaft H^2, supported in arms fulcrumed on said sleeve F^2, the prongs H', held on said shaft, the mechanism I, for imparting a sliding motion to said shaft H^2 from said rotary shaft F, and means, substantially as described, for disconnecting the clutch F^3 from the clutch D^3, whereby the motion of the slat belts G ceases, while the crosswise sliding motion of the shaft H^2 and its prongs H' continues, as set forth.

8. In a band-cutter and feeder for thrashing-machines, the sleeve F^2, the arms H^3, fulcrumed on said sleeve F^2, the shaft H^2, mounted in the free ends of said arms H^3, and having a crosswise sliding motion, in combination with the mechanism K, for imparting a swinging motion to said arms H^3, whereby said shaft H^2, with its prongs H', is raised or lowered, substantially as shown and described.

9. In a band-cutter and feeder for thrashing-machines, the combination, with the table G^2, provided on top and in its middle with a ridge, G^3, of the partition G^5, provided on its lower edge with pins engaging said ridge, said partition G^5 being hinged at the upper corner of its inner end to a cross-beam of the main frame, so that said partition G^5 can be disengaged from said ridge and swung upward and on the thrashing-machine, substantially as shown and described.

388,596. COMBINED DOOR-PLATE AND LETTER-BOX DOOR.

RALF STARNER, Chicago, Ill. Filed May 4, 1888. Serial No. 272,169. (No model.)

Claim.—1. In a combined door-plate and letter-box door, the combination, with a main frame divided into compartments, of a Y-shaped frame pivoted to the main frame and provided with a hook at each end and at the apex of the angled portion for securing a plate thereto to cover one of the said compartments, substantially as described.

2. In a combined door-plate and letter-box door, the combination, with a main frame having angular recesses in one of its side bars, of a Y-shaped frame provided with angular pivots and with a hook at each end and at the apex of the angled portion for securing a plate thereto, substantially as herein shown and described.

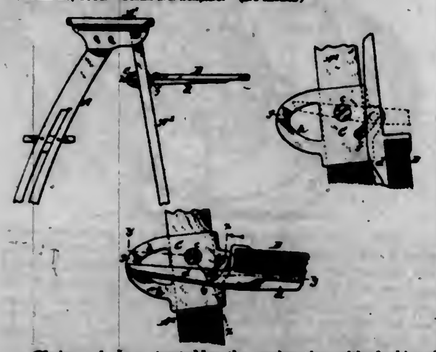
3. In a combined door-plate and letter-box door, the combination of the frame formed of the side bar A, provided with recesses H and K^4, the bar B, the end bars C, cross-bars F, longitudinal bar G, the panels M L L', the Y-shaped frame I, pivoted in the recesses H and provided with hooks I^2 z, the door J, held by the said frame, and the spring K', adapted to close the said door, substantially as specified.

388,597. LUMBERMAN'S BOOT. JOHN H. STURDEY, Boston, Mass. Filed Jan. 17, 1888. Serial No. 117,572. (No model.)

Claim.—The described lumberman's boot, having the long permeable felted leg A, formed in one with the felted foot B, such foot being provided with a sole, an intermediate semi-rigid sole-layer, D,

388,597.

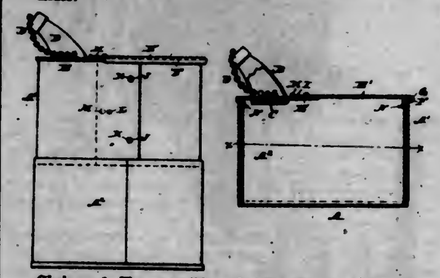
and an external water-proof covering, C, of rubber compound permanently vulcanized thereon, substantially as set forth.



388,598. APPARATUS FOR PLACING HYDRAULIC AND OTHER PIPES IN TRENCHES. BARNA A. SEARING, Waterbury, Conn. Filed Apr. 28, 1888. Serial No. 271,892. (No model.)

Claim.—1. The herein-described apparatus for placing pipes in trenches, consisting of a pair of beams adapted to extend across the trench and rest upon each side, the said beams upon their adjacent faces each constructed with a recess, F, combined with ropes G, attached by one end upon one side of each recess and extending across the recess, and one or more pulleys on each beam upon the side of the recess opposite to which the rope is attached, the ropes working upon said pulleys, substantially as described.

2. The combination of a pair of beams adapted to extend across the trench into which the pipe is to be placed, the beams each constructed with a recess, F, upon their adjacent faces, each beam constructed with longitudinally-projecting arms B C at its respective ends, the said arms provided with transverse bars H, pulleys on each beam at one side of the said recess, and ropes G, attached by one end to the other side of said recesses and extending across said recesses and over said pulleys, substantially as and for the purpose described.



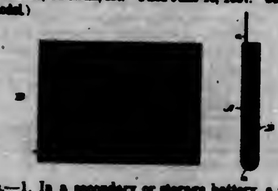
388,599. STEP-LADDER. CHARLES H. SPERRY, Silver Creek, assignor to the Empire Manufacturing Company, Forestville, N. Y. Filed Jan. 26, 1888. Serial No. 262,224. (No model.)

Claim.—1. In a step-ladder, the combination, with the hinged standard A^3 and the folding shelf B, of brackets or supports C, secured to the standard and provided with steps *g* and shelf-supporting arms *d*, pivoted to said brackets and engaging with their rear ends under the steps *g* of the brackets, whereby the shelf is supported in an elevated position, substantially as set forth.

2. The combination, with the standard and a folding shelf, of brackets or supports C, secured to the standard and provided with oblique or inclined slots *f*, shelf-supporting arms *d*, provided with pivots or studs *e*, arranged in said slots, and steps *g*, arranged on said brackets in rear of the pivots *e*, and with which the rear ends of the supporting-arms *d* engage, substantially as set forth.

388,600. PORTABLE TEA AND COFFEE POT. EMMA R. C. THOMPSON, Chicago, Ill. Filed July 11, 1887. Serial No. 243,977. (No model.)

Claim.—1. The expansible and contractible tea and coffee pot comprising an upper and a lower communicating section, one section being expansible and contractible horizontally to fit within the outside of the other section, substantially as and for the purpose set forth.



2. The expansible and contractible tea and coffee pot comprising a lower and an upper communicating section, one section sliding upon the other, while the upper section is formed into two parts horizontally expansible and contractible, substantially as and for the purpose set forth.

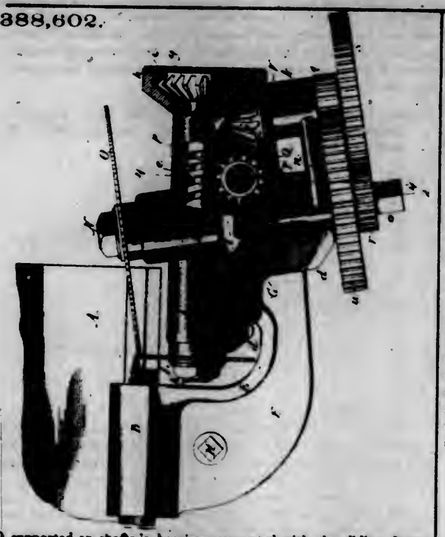
3. In an expansible and contractible tea and coffee pot, the combination of the lower and upper communicating sections, one section having a shoulder upon its inside near the upper end, while the other section is contractible horizontally, to enable it to rest at its lower edge upon said shoulder of the lower section, substantially as set forth.

4. In a tea and coffee pot, the upper section thereof provided with a bridge upon the inside at the top and with a spout secured integrally to said upper section and projecting above the top, substantially as and for the purpose set forth.

5. The tea and coffee pot comprising the lower and upper communicating sections, one section having a rib fitting in a groove in the other section and an inwardly-projecting shoulder near its upper edge, while the said other section is made in two parts horizontally contractible and expansible by projections or pins and apertures to permit the said other section to be supported upon the said shoulder of the first-named section and the telescoping of the first-named section within the latter section, substantially as set forth.

388,601. ELECTRODE FOR SECONDARY BATTERIES. SYLVANUS L. THAYER, St. Louis, Mo. Filed June 16, 1887. Serial No. 240,998. (No model.)

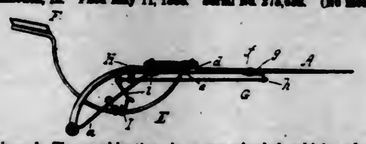
Claim.—1. In a secondary or storage battery, a sheet of perforated metal base or folded and a conducting-wire frame comprising vertical and horizontal wires attached to its inner side to form an outer covering or envelope for the electrode, substantially as set forth.



2. An electrode for a secondary or other battery, composed of an exterior perforated plate or envelope having attached to it internally a suitable conducting-wire and an interior perforated and corrugated plate, there being a suitable composition between the plates, and the whole being held or pressed together, substantially as set forth.

388,602. PORTABLE METAL-SAWING MACHINE. CHARLES W. THOMPSON, Chicago, Ill. Filed June 25, 1888. Serial No. 278,477. (No model.)

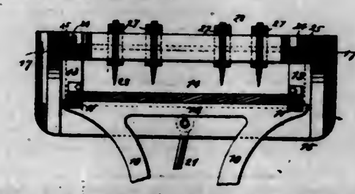
Claim.—1. A guide, as G, adapted to be secured to the material to be cut, in combination with a sliding frame, as I, carrying two saws, as L and O, supported by shafts in bearings connected with the sliding frame, substantially as and for the purpose specified.



2. A guide, as G, adapted to be secured to the material to be cut, in combination with a sliding frame, as I, carrying two saws, as L and

388,602.

O, supported on shafts in bearings connected with the sliding frame, and shaft K, provided with a screw-thread, *e*, and worm-pinion *f*, and screw-threaded shaft P, substantially as and for the purposes specified.

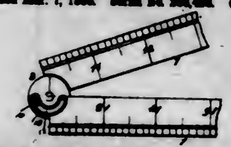


388,603. TWO-WHEELED VEHICLE. Joseph W. Vernon, Monmouth, Ill. Filed May 11, 1888. Serial No. 273,632. (No model.)

Claim.—1. The combination, in a two-wheeled vehicle, of the shafts and seat-supporting bars, the latter being hung at their forward ends, a longitudinal bar adjustably hung on the under side of each shaft, a double-hooked iron connected to each seat-bar, and a link depending from the rear end of each longitudinal bar and adapted to engage either of said hooks to change the point of suspension of said seat-bar, substantially as set forth.

2. The combination, in a two-wheeled vehicle, of the shafts, bar C, secured thereto and having loops depending therefrom, curved seat-bars hooked at their forward ends to engage said loops, guides H, and threaded perforated plates *g*, depending from each shaft, a rod, G, supported in said guides and threaded to engage said plates, a double-hooked iron, I, secured to each bar H, and a link, *i*, connected to the rear end of each bar G, and adapted to engage either of the hooks of the iron below, substantially as set forth.

388,604. MACHINE FOR PUNCTURING SHEET METAL. George F. Wahlbe and Herman G. Grey, Brooklyn, N. Y. Filed June 6, 1888. Serial No. 276,213. (No model.)

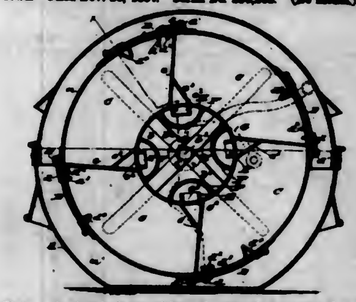


Claim.—1. In a machine for puncturing sheet metal, the combination, with standards, a bed supported by said standards, and corner-posts attached to the same, of an outer frame reciprocating upon said posts, tool-carrying bars adjustably mounted in said reciprocating frame, clamps adjustably secured upon the said tool-carrying bar, and means, substantially as shown and described, for reciprocating the outer frame, as and for the purpose specified.

2. In a machine for puncturing sheet metal, the combination, with standards, a bed supported upon said standards, and posts perpendicularly projected from the same, of an outer frame reciprocating upon said posts, provided with a longitudinal opening in the sides and ends, a tool-carrying bar adjustably supported in said reciprocating frame, clamps adjustably secured to said tool-carrying bar, and means, substantially as shown and described, for reciprocating the outer frame, as and for the purpose specified.

3. In a machine for puncturing sheet metal, the combination, with standards, a table supported upon said standards, and corner-posts perpendicularly projected from said standards, provided with perpendicular ribs, of a reciprocating outer frame having perpendicular grooves produced therein to receive the ribs of the posts, horizontal openings in the sides and ends exposing the table, longitudinal slotted tool-carrying bars adjustably secured in the outer reciprocating frame, clamps surrounding said reciprocating bar, provided with an opening aligning the slot in the said bar for the reception of the tool, and means, substantially as shown and described, for securing the clamp to the bar and the tool in the clamps, as and for the purpose specified.

4. The combination, with a table and a reciprocating frame surrounding said table, of a series of longitudinal slotted tool-carrying bars adjustably secured in said frame, clamps surrounding said bar and sliding thereon, provided with an aperture aligning the slot in the tool-carrying bar and a projection on the upper end, a set-screw passing through the clamp to an engagement with the tool-carrying bar, and a second set-screw passing through the projection of the clamp, adapted to bind the upper end of the tool, substantially as and for the purpose specified.



388,605. CARPENTER'S RULE. Hiram H. Wales, Boston, Mass. Filed Mar. 7, 1888. Serial No. 266,496. (No model.)

Claim.—1. A carpenter's rule having a joint consisting of a circular projection on one leg of the rule centrally pivoted between the two projections on the other leg of the rule, one of the projections having a beveled edge concentric with the pivotal point of the joint, and an adjusting-pin transverse to the projections and provided with a beveled clamping-surface engaging said beveled edge, substantially as described.

2. A carpenter's rule having a joint consisting of circular projection 2, having a beveled edge, 16, centrally pivoted between circular projections 3, and the clamping-pin 17, having beveled projection 18, engaging beveled edge 16 and screw-threaded end 19 with thumb-nut 20, substantially as described.

388,606. WASHING-MACHINE. John R. Wilfong, Red Oak, Iowa. Filed Nov. 30, 1887. Serial No. 256,502. (No model.)

Claim.—1. A tubular washing-wheel having a central transverse opening and a series of compartments arranged around said opening and communicating therewith, substantially as described, whereby provision is made for allowing the water in the compartments to flow into the central opening and from thence out through the ends thereof into the receptacle in which the wheel is mounted, as set forth.

2. A tubular washing-wheel having a central transverse opening and provided with a series of compartments arranged around the said opening, each compartment being provided with an apertured door and with an aperture in its bottom opening into the central transverse opening of the wheel, substantially as herein shown and described.

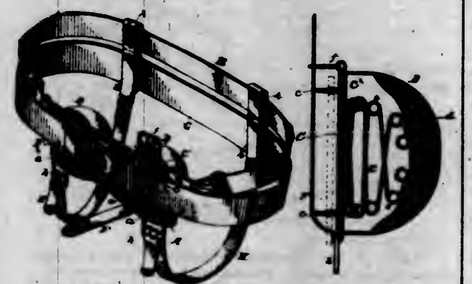
3. In a washing-machine, the combination, with a tubular wheel having a central transverse aperture and provided with a series of compartments having apertures in their bottoms, of doors for closing the said compartments provided with apertures, guards over the apertures in the compartments and doors, and bridges at the hinged ends of the doors, substantially as described.

4. In a washing-machine, the combination, with a tubular wheel having a central transverse opening and provided with a series of compartments having openings in their bottoms and closed by doors, of shields F, secured within the transverse aperture of the wheel over the openings in the bottoms of the compartments thereof, substantially as herein shown and described.

5. In a washing-machine, the combination, with a tubular wheel having a central opening, *b*, and a series of apertured compartments, C, of the guards E and the shields F, substantially as and for the purpose set forth.

6. The herein-described tubular washing-wheel, consisting of the tubular wheel B, having the central transverse opening, *b*, and divided into compartments C by the inclined partitions *c*, the said compartments having apertures in their bottoms, the apertured and hinged doors D, for closing the said compartments, guards d' and d^2 over the openings in the compartments and doors, respectively, the guards E around the openings in the central opening, *b*, and the shields F over the guards E, as specified.

388,607. PIPE-WRENCH. David B. Wheeler, North Carondelet, Pa. Filed Apr. 16, 1888. Serial No. 270,703. (No model.)



Claim.—1. The combination of handle A, having a stud, *a*, and shoulders C on its front end and a revolvable angular block mounted on stud *a*, and having grooves in its ends for engaging shoulders C, with the angular jaw pivoted to handle A, and the operating-handle therefor, all constructed and arranged substantially in the manner and for the purpose described.

2. In a pipe-wrench, the combination of the handle and its pivoted jaw with a supplementary adjustable handle having an angular head loosely connected with the pivoted jaw and adapted to open the latter when the handles are opened, all constructed and arranged substantially as and for the purpose described.

3. The combination, with the handle having a toothed slot and the jaw pivoted thereon, of a supplementary handle having a slotted head adjustably engaging the slotted handle and also loosely engaging the pivoted jaw, whereby the jaw is opened when the handles are opened and forcibly closed when the latter are closed, all constructed and arranged to operate substantially in the manner as and for the purpose described.

388,608. TRUSS. Joachim Wiler, Garrett, Ind. Filed Feb. 27, 1888. Serial No. 265,469. (No model.)

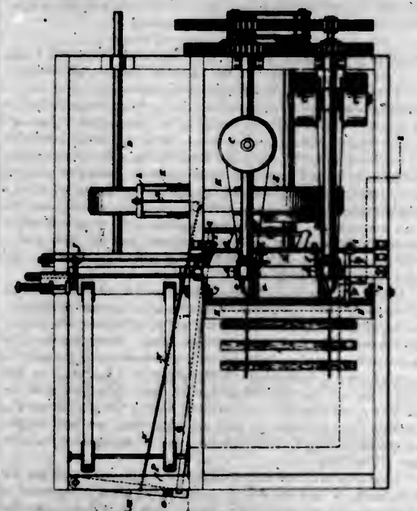
Claim.—1. The combination, with the slotted plate A, of the pads having the perforated lugs *c* passed through the slots in the plate A, the spring-pins C, and a suitable belt, substantially as set forth.

2. The combination, with the slotted plate A, of the belt B, the pads having the perforated lugs *c*, the spring-pins C, the straps F, and the belt G, substantially as described.

3. The combination, with the slotted plate A, of the belt B, attached to said plate, the pads having the perforated lugs *c* passed through the slots in plate A, the spring-pins C, the straps F, the belt G, the buckles *h*, attached to the pads, and the thigh-straps H, having the loops *h'*, through which pass loosely the belts G and B, substantially as described.

4. A pad for a truss, composed of the base-plate C, the plate C', the cover D, clamped between the two plates, the cushion *d*, and the M-shaped springs E, having a coil at each angle and arranged side by side with their fixed ends secured alternately in opposite sides of the plate C', and their free ends bearing against the under side of the cushion, substantially as and for the purpose set forth.

388,609. LAMP-WICK. Adolfo Sáenz Yáñez, Havana, Cuba. Filed Sept. 20, 1887. Serial No. 249,497. (No model.)



Claim.—1. The combination, with the wick-tube open at both ends, of a supplemental open-ended casing or mouth-piece within the outer end of the said tube and of less external diameter than the internal diameter of the tube to form the longitudinally-extending space *f* between the inner wall of the tube and the outer wall of the mouth-piece and the spacing projections or lugs, substantially as set forth.

2. The combination, with the wick-tube open at both ends and having lateral perforations and the spacing projections or lugs through it near its upper end, of the mouth-piece extending down within the tube at its upper end to a point just above the perforations, the mouth-piece being open at both ends and of less external diameter than the internal diameter of the tube to form the longitudinally-extending space *f* between its outer side and the inner side of the tube, substantially as set forth.

3. The combination, with the wick-tube open at both ends and having the wick extending up into the tube, and a granular or powdered filling extending from the wick to the upper end of the tube, of the mouth-piece open at both ends of less diameter than the bore of the tube and embedded in the said filling, and spacing projections or lugs between the mouth-piece and the inner wall of the tube, substantially as set forth.

4. The combination, with the wick-tube open at both ends and having perforations through its walls near its upper end, and the mouth-piece open at both ends and extending downwardly into the upper end of the tube to a point adjacent to said perforations, and the spacing projections or lugs between the mouth-piece and tube, of the granular or powdered material filling the upper end of the tube to a point just below the perforations, and also filling the mouth-piece and space *f* between it and the inner side of the tube, substantially as set forth.

388,610. MACHINE FOR MAKING FENCE. Joseph Brown, Quincy, Ill., assignor, by mesne assignments, to the Automatic Fence Loom Company, of New Jersey. Filed Nov. 2, 1887. Serial No. 254,095. (No model.)

Claim.—1. In a fence-machine, the combination, with the twisters, of a belt-tightener or equivalent device for governing the trans-

mission of power to the machine, levers or pawls for controlling the operation of the same, arranged to be held out of action by the wires leading from the reels to the points of twisting, and a device or devices connecting the levers or pawls with the belt-tightener or its equivalent, whereby the machine is automatically stopped whenever either of the wires breaks or runs out, substantially as described.

2. In a fence-machine, the combination, with the twisters, of a belt-tightener or equivalent device for governing the transmission of power to the machine, stop mechanism for controlling the operation of the same, and levers or pawls normally sustained or supported, respectively, by the wires leading from the reels to the point of twisting and by the pickets in their passage through the machine, and adapted when released or dropped by the failure of either a wire or wires or of the proper supply of pickets to bring the stop mechanism into action, as set forth.

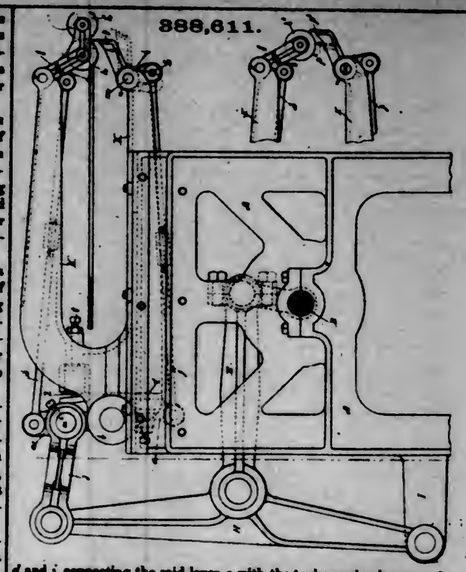
3. In a fence-machine, the combination, with the twisters, of a belt-tightener or equivalent device for governing the transmission of power to the machine, a rock-shaft or bar operating or controlling the same, and levers or pawls for controlling the operation of the rock-shaft or bar, the said levers or pawls being normally sustained or supported by the wires and pickets, respectively, and adapted by their release to set in operation the rock-shaft, and thereby disconnect the motive power, substantially as set forth.

4. The combination, in a fence-machine, of levers or pawls carried by the twisting-heads or their shafts and arranged to be normally restrained against the force of gravity or a spring by the wires passing from the reels to the twisters, a rock-shaft or bar provided with fingers or arms, with which the levers or pawls engage when released, and a belt-tightener or equivalent device operated by the rock-shaft for controlling the transmission of power to the machine, substantially as described.

5. The combination, in a fence-machine, of an automatic picket-feeding device with a movable piece located in the path of movement of the pickets that are fed into the machine and restrained by them as they successively pass through and from the twisters, a belt-tightener or equivalent device for governing the transmission of power to the machine, and intermediate mechanism for causing the release of the movable piece to act upon the belt-tightener, whereby the machine is stopped automatically when the proper supply of pickets fails, substantially as described.

6. The combination, in a fence-machine, of a pawl or lever supported by the forward ends of the pickets in their progress through and from the wire-twisters with stop mechanism adapted to be operated by the release of the pawl when not supported by the pickets, substantially as set forth.

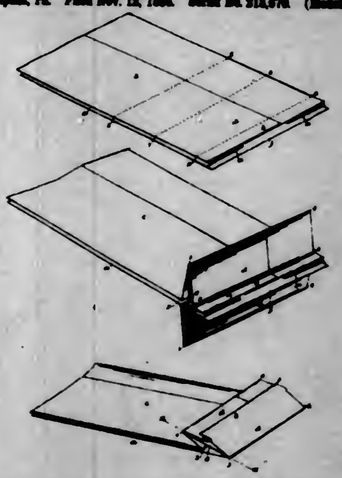
7. The combination, with the automatic picket-feeding device and the reciprocating guideway or pushing-head, of a pawl or lever adapted to engage with the guideway or head when not supported by the pickets and a power-detaching device brought into operation by the pawl or lever when moved by the guideway, substantially as described.



8. The combination, in a fence-machine, of the pawls *m m'*, the rock-shaft R, provided with the arms *l l'*, and the belt-tightener operated by the rock-shaft, substantially as described.

388,611. LEATHER-STRETCHING MACHINE. William R. Adams, Lynn, Mass. Filed Apr. 17, 1888. Serial No. 270,911. (No model.)

Claim.—1. In a machine for stretching leather, the combination, with a stationary support or frame, of a sliding frame mounted thereon and provided with movable stretching-tools, a two-armed tool-actuating lever mounted on said sliding frame and connected by adjustable rods with said stretching-tools, said lever having a limited movement independently of said frame, an operating-lever pivoted to said stationary frame and connected with the said tool-actuating lever and a crank with which said operating-lever is connected, whereby one part of the movement of the said operating-lever will vibrate the tool-actuating lever to operate the stretching-tools, and the other part of the movement of the said operating-lever will reciprocate the said sliding frame, as set forth.

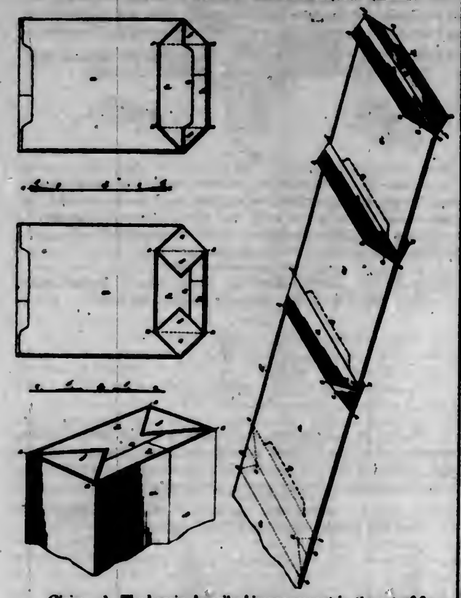


2. The combination, with the sliding frame K, of the two-armed tool-actuating lever *a*, mounted on said frame at its rear end, the tool-carrying levers *f* and *l* at the forward end of said frame, the stretching-tools carried by said levers, the rods *d* and *j*, connecting the opposite arms of said lever *a* with the said tool-carrying levers, and the operating-lever H, connected with the said lever *a*, and stops on said sliding frame to limit the independent or vibrating movement of the said lever *a*, whereby the tool-actuating lever is adapted to serve as a medium through which the said operating-lever can both reciprocate the said sliding frame and actuate the stretching-tools, substantially as set forth.

3. In a leather-stretching machine, the combination, with the sliding frame K, of the two-armed tool-actuating lever *a*, mounted on said frame at its rear end, the tool-carrying levers *f* and *l* at the forward end of said frame, the operating-lever H, connected with the said lever *a*, the stretching-tools carried by the said levers *f* and *l*, the rods

d and *j*, connecting the said lever *a* with the tool-carrying levers, and the yielding blocks *g g'*, serving as elastic or cushioning stops to limit the vibratory movements of the said lever *a* independently of the sliding frame on which it is mounted, substantially as set forth.

388,612. ART OF MAKING PAPER BAGS. Daniel Auten, Cleveland, Ohio, assignor to the Union Paper Bag Machine Company, Philadelphia, Pa. Filed Nov. 12, 1886. Serial No. 218,670. (Model.)

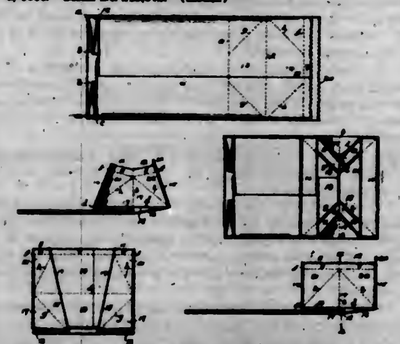


Claim.—1. The herein-described method of forming a square-bottom bag from a bellows-sided tube, which consists in distending or carrying apart and folding the sides of the tube at the lines 3 4, which define two edges of the bag-bottom, while the mouth of the bottom-forming end of the tube remains in a closed or substantially closed condition, substantially as described.

2. The herein-described method of forming a square-bottom bag from a bellows-sided tube, which consists in distending or carrying apart and folding the sides of the tube at the lines 3 4, which define two edges of the bag-bottom, while the mouth of the bottom-forming end of the tube remains in a closed or substantially closed condition, and then folding over and securing to the bottom the portion *b*, substantially as described.

3. The herein-described method of forming square-bottom bags from a continuous tube, which consists in cutting the material to form the lip *f*, then distending or carrying apart and folding the sides of

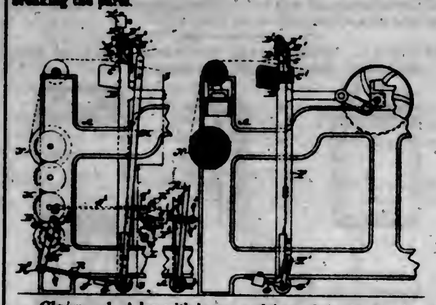
the tube upon the lines 3 4, which define two edges of the bag-bottom, while the mouth of the bottom-forming end remains in a closed or substantially closed condition, then covering the tube upon the line 6 4, and then folding over and securing to the bottom the projecting portion *b*, substantially as described.



388,613. ART OF MAKING PAPER BAGS. Daniel Auten, Cleveland, Ohio, assignor to the Union Paper Bag Machine Company, Philadelphia, Pa. Filed Nov. 12, 1886. Serial No. 218,671. (Model.)

Claim.—1. The herein-described improvement in the art of forming a satchel-bottomed bag from a continuous tube, which consists in distending or carrying apart and folding the sides of the tube at the lines 2 3, which define two edges of the bag-bottom, while the main part of the tube is retained in its flat condition, substantially as described.

2. The herein-described improvement in the art of forming a satchel-bottomed bag from a continuous tube, which consists in distending or carrying apart and folding the sides of the tube at the lines 2 3, which define two edges of the bag-bottom, while the main part of the tube is retained in its flat condition, and then covering the tube and folding over the lip *e* and folding inward the projecting points *f* and securing them to the bottom of the bag, substantially as described.



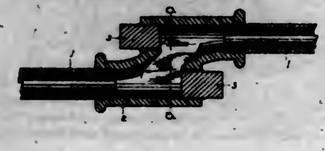
388,614. PAPER BAG. Daniel Auten, Cleveland, Ohio, assignor to the Union Paper Bag Machine Company, Philadelphia, Pa. Filed Oct. 8, 1886. Serial No. 215,572. (Model.)

Claim.—A bellows-sided bag having a rectangular bottom closed by a single transverse seam, and having the triangular portions 18 19 lying inside said bottom, substantially as described.

388,615. TAKE-UP MECHANISM FOR LOOMS. Frederic A. Allison, Philadelphia, Pa. Filed Jan. 4, 1887. Serial No. 223,978. (No model.)

Brief.—The pivoted reed is held in position, commonly, by the action of the weighted elbow-levers. When the lay moves forward, however, the reed meets the fell of the cloth and is pushed rearwardly, and this movement of the reed is utilized by suitable connections to set the actuating-pawl of the take-up mechanism, which as the lay retreats is moved by the action of the weighted elbow-levers in restoring the reed to proper position. A yielding connection is interposed in the pawl-actuating mechanism to prevent an undue strain from breaking the parts.

Claim.—1. A lay with bosses, and journals having bearings in said bosses, in combination with a frame carrying a reed, and slotted arms connecting said frame and journals, arms connected at their upper ends to said frames and provided at their lower ends with pins, weighted levers each having a bifurcated end in which said pin works, a vertical arm secured to one of said journals, so as to oscillate therewith, a winding-drum with pinion on its journal, and mechanism, substantially as described, connected to said pinion and vertical arm, for converting the oscillating motion of the arm into the rotary movement of the drum, substantially as described.

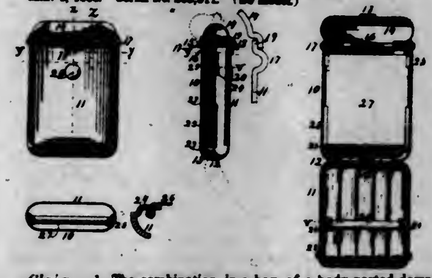


2. A lay, in combination with the journals *D'*, having bearings in bosses connected to said lay, a frame secured to said journals, a reed in said frame, the arms F, secured to said frame and provided with the pins P at their lower ends, the weighted levers G, each having a bifurcated end, the vertical arm H, secured to one of said journals *D'*, so as to oscillate therewith, a winding-drum having a pinion on its journal, a train of gearing with ratchet-wheel, a pivoted lever with a pawl, and a rod connected to said arm H and adapted to oscillate the said pivoted lever, substantially as and for the purpose set forth.

3. A lay with bosses and a frame having a reed therein, in combination with journals having bearings in said bosses, the vertical arm H, secured to one of said journals, the rod J, the arm K, having the pawl K', a winding-drum with pinion thereon, and a train of gearing between said arm K and pinion of winding-drum, the said train having a ratchet adapted to be operated by said pawl K', so as to rotate said winding-drum, substantially as described.

4. A lay with bosses, and journals having bearings in said bosses, in combination with a frame carrying a reed, and arms connecting said frame to said journals, the vertical arm H, secured to one of said journals, the rod J, connected to the arm H and having the collar R thereon, the arm K, loosely fitted on the rod J, the spring Q, located on said rod J between the collar R and arm K, the nut R', the pawl K' on arm K, a train of gearing having the ratchet L, adapted to be operated by said pawl K', and a winding-drum having a pinion operated by said train of gearing, substantially as described.

5. A lay with bosses D² and journals *D'*, in combination with the vertical arm H, the arm K, with pawl K', an operating-rod connecting said arms H and K and having a collar with clamping-screw thereon, a winding-drum having a pinion, a train of gearing with a ratchet adapted to operate said drum, and a spring between said arm K and said collar on operating-rod, normally adapted to bear against said arm K, but adapted to yield in case of unusual resistance of the ratchet-wheel, due to strain on the winding-drum.

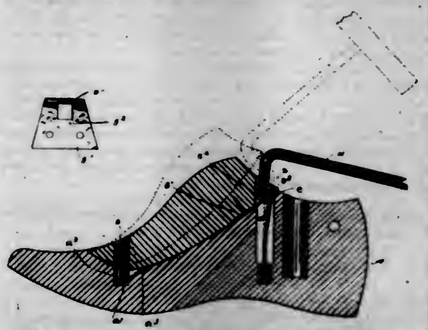


388,616. FLUID-CONDUIT. Seneca L. Bailey, Lowell, Mass. Filed Feb. 20, 1888. Serial No. 264,893. (No model.)

Claim.—1. A pipe-coupling having at its opposite ends screw-threaded pipe-receiving openings offset from each other, and a single unobstructed chamber forming a communication between said openings, said coupling having also a mud-hole at each end directly opposite or in line with said pipe-receiving openings and adapted to be closed by removable stoppers or plugs, substantially as set forth.

2. A pipe-coupling having at its opposite ends screw-threaded pipe-receiving openings offset from each other, and a single unobstructed chamber forming a communication between said openings, said coupling having also a mud-hole at each end directly opposite or in line with said pipe-openings, combined with two pipes screwed into said pipe-openings and with two removable stoppers or plugs closing said mud-holes, substantially as set forth.

388,617. CIGARETTE-CASE. JULES BERTHE, Louisville, Ky. Filed Mar. 1, 1888. Serial No. 265,811. (No model.)



Claim.—1. The combination, in a box, of a body parted down its side edges and across its lower end and hinged together at its lower end, and a lid hinged to the upper end of one of the parts and provided with a spring-catch to engage the other part and fitted to close entirely around the upper ends of both parts, substantially as shown and described.

2. The combination, in a box made of sheet metal, of a body parted down its sides and the parts hinged together, each of the parts being provided with inward-projecting lips along its edges, the said lips being shaped with angles or ledges to engage the inner corner of the opposite edges of the box, and the lips upon one part of the box alternating along the line of juncture with the lips of the opposite part, substantially as shown and described.

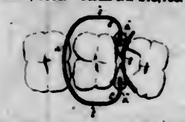
3. The combination, in a box made of sheet metal, of a body parted down its sides and the parts hinged together, each of the parts being provided with inward-projecting lips along its edges formed with ledges, as described, certain of the said lips extending still farther inward beyond the ledges and punctured with T-shaped openings, and an elastic strap provided with metallic heads adapted to engage the said lips at the T-shaped openings, substantially as shown and described.

4. The combination, in a box made of sheet metal, of a body parted down its sides and the parts hinged together, each of the parts being provided with inward-projecting lips along its edges, formed with ledges, as described, and the lower lips bent backward, forming shelves, substantially as shown and described.

388,618. LAST. JOHN C. BENFORD and WARREN I. BENFORD, Berlin, Mass.; Clara T. Stetson administratrix of said Warren I. Stetson deceased. Filed May 26, 1888. Serial No. 275,515. (No model.)

Claim.—1. The body of the last provided with a shoulder, a^2, and a latch, combined with the block having a pin or stud at its under side at or near its lower end to co-operate with the said shoulder, and at its upper end a shoulder or projection, b^2, to be engaged by the said latch, substantially as described.

2. The body of the last and its attached latch having a beveled upper end, combined with the block of the last, provided at its upper end with a shoulder or projection, b^2, and a bar, b^3, substantially as and for the purpose described.



3. The body of the last provided with the spring-latch *c*, fixed thereto, and the block B, separated from the body of the last by a curved cut, as *a*, combined with a pin, *b*, at or near the lower end of the block, and the plate b' at or near the upper end of the block, and the latch *c*, engaging the said block, substantially as described.

388,619. DENTAL MATRIX. HENRY P. BOOTH, Chippewa Falls, Wis. Filed Jan. 26, 1888. Serial No. 262,262. (No model.)

Claim.—In combination, an artificial wall for a dental cavity, consisting of, a strip, *c*, placed between the teeth and substantially at right angles to the row of teeth, and two wedges, *d d*, inserted between the strip and tooth adjacent thereto, and provided with a connecting-spring, *a*, as and for the purpose described.

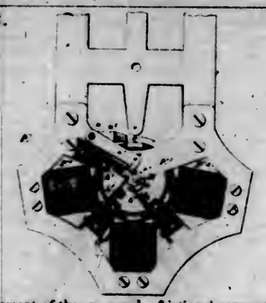
388,620. DENTAL MATRIX. HENRY P. BOOTH, Chippewa Falls, Wis. Filed June 1, 1888. Serial No. 276,702. (No model.)

Claim.—In combination, an artificial wall for a dental cavity, consisting of a strip, *c*, placed between the teeth and substantially at right angles to the row of teeth, and two wedges, *d d*, pivoted to a connecting-spring, *a*, as and for the purpose described.

388,621. DOOR-CHECK. BENJAMIN F. BOOSER, Randolph, Mass. Filed May 2, 1888. Serial No. 272,256. (No model.)

Claim.—1. A door stop and check, consisting of the combination of a base-frame adapted to be attached to the floor, a pivoted spring-actuated lever-catch, D, arranged at the outer end of the frame, and a sliding abutment, B, arranged upon the top of the frame and bearing against the upper end of the lever-catch, and having a spring for forcing it forward of greater power than the spring of the catch, as and for the purpose described.

2. A door stop and check, consisting of the combination of the base-frame A, slide B, with lug *b* and tongue *c*, spring C, arranged to bear against the lug, the lever-catch D and spring *d*, and a sliding connection for holding the slide B to the frame A, as and for the purpose described.



388,622. ELECTRIC MOTOR FOR SELF-WINDING CLOCKS. FRANK W. BRADBURY, Chicago, Ill. Filed May 26, 1888. Serial No. 275,062. (No model.)

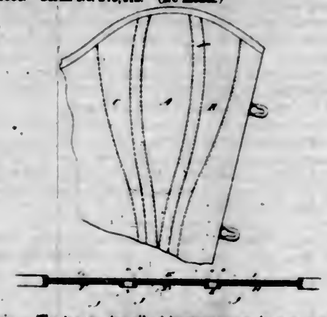
Claim.—1. The combination, with a clock mechanism and an electric-motor armature for winding the same, of a detent for arresting the armature in a predetermined position with reference to the magnetic field of the motor upon its retrograde movement and a connection between the armature and the arresting-detent, substantially as described.

2. The combination, with a clock mechanism and an electric-motor armature for winding the same, of a detent for arresting the armature in a predetermined position with reference to the magnetic field of the motor upon its retrograde movement.

3. In a self-winding clock having an electric motor with a rotating armature, the combination, with the armature-drum, of a pivoted arresting-detent intercepting the path of the armature-drum upon the

388,622.

backward movement of the same and a frictional connection between the armature-shaft and said detent for throwing the same out of the path of the armature-drum during the forward movement of the latter, substantially as set forth.



4. In a self-winding clock, the combination, with a rotary electric motor for winding the clock mechanism having the armature-bars $c' c'$, of the arresting-detent a^2 for intercepting the paths of the same, the frictional lever *a'*, moving with the arresting-detent, and the flange or disk upon the armature-shaft engaging the end of the frictional lever, substantially as described.

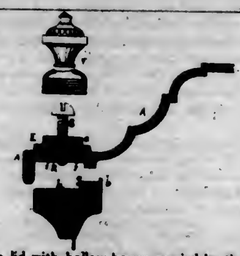
5. In a self-winding clock having a rotating electric motor, the combination, with the motor, of an arresting device for the armature of the same stopping the armature in a predetermined position other than a dead or neutral point upon the cessation of the winding.

6. In a self-winding clock mechanism having a rotating electric motor for winding the same, the combination, with the driving-spring of the clock tending to normally reverse the direction of rotation of the motor upon the cessation of winding, of an arresting device acting in conjunction with said spring to arrest the armature of the motor in a predetermined position other than a dead-point of the motor at the cessation of the winding, substantially as described.

7. In a clock mechanism having a winding electric motor with a rotating armature, the combination, with the armature-drum, of a pivoted arresting-detent intercepting the path of the armature-drum upon the backward movement of the same, and a frictional connection between the armature-shaft and said detent for throwing the same into the path of the armature-drum during the retrograde movement of the latter, substantially as described.

388,623. CORSET. MORRIS P. BRAY, Ansonia, Conn. Filed July 9, 1888. Serial No. 279,412. (No model.)

Claim.—The herein-described improvements in corsets, consisting in the breast portion constructed in several sections, each section composed of an inner thickness and an outer thickness, one of said thicknesses no greater in width than the width the section is to occupy in the corset, the other thickness of greater width than the one thickness, and a stiffening fabric of substantially the same size and shape as the said one thickness between the said two thicknesses, the said three thicknesses forming each section stitched together, the greater breadth of one thickness forming a margin of single thickness, and the said sections united by stitching the adjacent margins together, combined with an overlay over the said stitched margins, substantially as described.



388,624. FASTENER FOR COFFINS. MAX BERGER, New York, N. Y. Filed Feb. 23, 1888. Serial No. 264,966. (No model.)

Claim.—1. The combination of the body and metallic lid of a burial-case and securing-screws therefor with yielding retainers for the screws carried by the lid.

2. The combination of the body and lid of a burial-case and securing-screws for the lid with hollow bosses carried by the lid and containing yielding material through which the retaining-screws pass.

3. The combination of the body and lid of a burial-case and retaining-screws therefor with hollow bosses on the lid, socketed escutcheons to fit on the said bosses, and screws passing through the escutcheons and bosses.

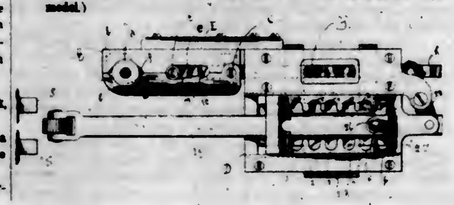
388,624.

388,625. CANNON-PINION FOR WATCHES. LEONARD C. BRIGGS, East Saginaw, Mich. Filed Dec. 22, 1887. Serial No. 258,765. (No model.)

Claim.—The combination, with a journal, B, of uniform dimensions from top to base of the pinion-seat, with the exception of a groove, *b*, of a pinion having at the lower end of its split hub an indentation, *a'*, and an inwardly-turned flange or burr, substantially as described.

388,626. WIRE-TIGHTENER. DAVID T. BROWN, Walker, Mo. Filed May 12, 1888. Serial No. 273,749. (No model.)

Claim.—1. A wire-tightener comprising a head or body provided with a gripper for the wire, formed of two arms or sections pivoted with relation to each other, and a holder to which said head or body is journaled, substantially as set forth.



2. A wire-tightener comprising a head or body, a holder to which said head or body is journaled, the gripper formed of two arms connected to the head or body and pivoted with relation to each other, and an adjustable connection between the said arms, whereby they may be clamped firmly together when twisting the wire, substantially as set forth.

3. The improved wire-tightener consisting of a holder, and a head or body portion journaled to said holder and provided with a gripper having near its outer end a transverse opening for the wire to be stretched, and having its edges inclined or curved toward such end, substantially as set forth.

4. The improved wire-tightener comprising a head or body, a gripper consisting of arms connected with said head or body and pivoted with relation to each other, the holder to which such head or body is journaled, and the handle whereby to turn such part, substantially as set forth.

5. The wire-tightener herein described, consisting of the head or body, the handle by which to turn it, and the holder to which it is journaled, the gripper consisting of arms connected with the head or body and pivoted with relation to each other, such arms having near their outer ends slots or notches forming a guide-opening, and having such ends inclined or curved, and the adjustable connection whereby said arms may be clamped together, substantially as set forth.

388,627. ELEVATOR. WILLIAM F. BULLOCK and WILLIAM F. HARRIS, Lynn, Mass. Filed Sept. 3, 1887. Serial No. 248,005. (No model.)

Claim.—1. The combination of the rod 25, the indicator 27, each adapted to be moved independent of the other, an operating-lever for locking the rod *h* and indicator together, cams S on the elevator-well for engaging and moving the rod 25, and a clutch mechanism, in connection with the indicator, adapted to be set in motion by moving the rod 25 and to automatically grasp the shipper-cord, substantially as described.

2. The combination of the movable rod 25 and independently-movable indicator 27, engaging cams S, the connecting-link 28, the rod *h*, and a clutch mechanism, substantially as described.

3. The combination of the rod 25, the frame D, slide 23, and movable indicator 27, substantially as described.

388,628. PROCESS OF MAKING BATTERY-ZINCS. ROBERT L. CARR and PARKER BORDEN, Fall River, Mass. Filed Dec. 15, 1887. Serial No. 257,972. (No model.)

Claim.—1. The improved process of constructing battery-zincs herein described, the same consisting, essentially, of forming a body consisting wholly or in part of an amalgam of zinc and mercury, and a cap consisting of pure or approximately pure zinc, and having a conducting-wire cast therein and projecting at two sides thereof, placing said body, cap, and wire in a closed vessel, and submitting them to heat to unite them, substantially as set forth.

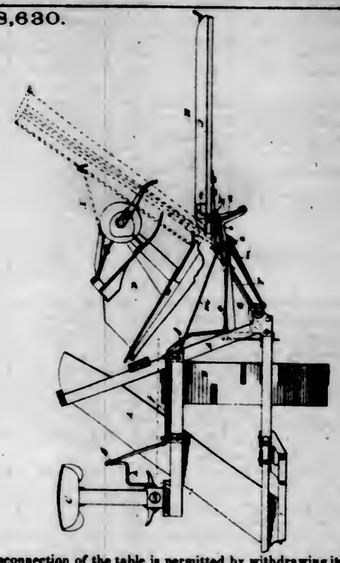
2. That improvement in the process of constructing battery-zincs which consists in forming a body composed wholly or in part of an amalgam of zinc and mercury, and having a socket in its upper portion, and a cap composed of pure or approximately pure zinc and provided with a conducting-wire cast or fused into the same, placing said body and cap in a closed vessel with a portion of the cap and wire in said socket, and submitting them to the action of heat to unite them, substantially as described.

3. That improvement in the process of constructing battery-zincs which consists in tinning the conducting-wire, casting a pure or approximately pure zinc cap around the same, leaving the ends of said wire projecting, and then uniting said cap and wire to the body of the zinc by the action of heat, a proper flux being employed between the united parts, substantially as set forth.

388,629. METAL STRAP FOR PACKING-BOXES. SPENCER C. CARY, Baldwin, N. Y. Filed Oct. 15, 1886. Serial No. 216,304. (Model.)

Claim.—1. A metal box-strap provided with longitudinal stiffening-corrugations along and immediately upon its edges, substantially as and for the purpose set forth.

2. A metal box-strap having longitudinal stiffening-corrugations and its extreme edges downwardly turned to project beyond its under face, substantially as and for the purpose described.



388,630. BUNDLE-CARRIER FOR GRAIN-BINDERS. HENRY J. CASE, Auburn, N. Y., assignor of one-half to D. M. Osborne & Company, same place. Filed July 30, 1886. Serial No. 209,577. (No model.)

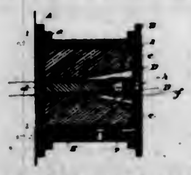
Claim.—1. In combination with a grain harvesting and binding machine, a socket or bearing near its front on the stubble side, and the horizontal or approximately horizontal sheaf-carrying table provided with the arm or journal seated in said socket or bearing, said arm and socket having a downward inclination toward the harvester, substantially as described, whereby the rear end of the table is caused to swing outward as it descends.

2. In combination with a grain harvesting and binding machine, the horizontal or substantially horizontal bundle carrying table, and a supporting shaft or journal attached to said table and seated in bearings on the frame, its axis extending at right angles to the line of travel with an inclination upward from the machine.

3. In combination with a harvesting and binding machine, a sheaf-carrier and a connecting pivot or journal, substantially as described, having its axis of rotation inclined from the horizontal and adapted to permit the carrier to be turned thereon from a horizontal operative position to an upright position, bottom side up, whereby the passage of the machine through narrow openings is permitted.

4. A harvesting-machine provided with a socket inclined from the horizontal, in combination with a sheaf-carrying table having the supporting journal or pivot fixed rigidly thereto, seated in the socket and retained solely by gravity, as described, whereby the instantaneous disconnection of the table is permitted by withdrawing its journal from the socket.

5. A harvesting and binding machine having the inclined sockets or bearings attached thereto, in combination with the sheaf-carrying table having the journal fixed rigidly thereto, seated in the bearings and adapted for instantaneous withdrawal at will.



6. In combination with a harvester and binder, the sheaf-carrying table pivoted thereto to fall at its rear end, a spring-actuated latch jointed to the table and carried thereby, the fixed arm on the main frame to engage the latch and maintain the table in operative position, and the operating rod or chain connected to said latch, and serving, as described, the twofold purpose of disengaging the latch from the arm that the table may fall and of acting through the latch to lift the table from its depressed to its operative position.

7. In combination with a harvesting and binding machine, a sheaf-carrying table pivoted thereto to fall at its rear end, the pivoted latch and its actuating-spring connected to the table, a rigid arm, *e*, with which said latch engages to sustain the table, the operating-rod connected to the latch, and controlling devices connected to said rod and located adjacent to the driver's seat, whereby the driver is enabled to disengage the latch and permit the fall of the table, and subsequently to restore the table positively to its elevated position.

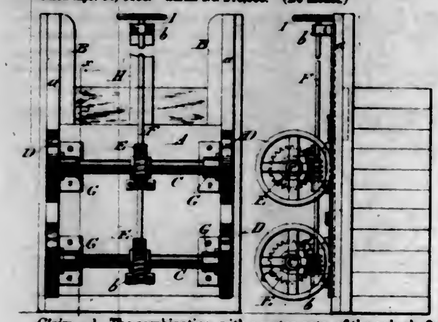
8. In combination with a downwardly-swinging table, the guard or bundle-detaining device hinged to its edge, and mechanism, substantially as described, actuated by the swinging of the table, for permitting said guard to turn downward out of action as the table descends.

9. The pivoted falling table, in combination with the fixed arm *e*, the arm *a*, latch *b*, and spring *c*.

388,631. ELECTRIC FIRE-ALARM SIGNAL-BOX. HENRY A. CRANE, Evart, Mich. Filed Mar. 31, 1888. Serial No. 269,126. (No model.)

Claim.—1. In an electrical fire-alarm signal-box, the combination of two springs forming a part of the electric circuit, blocks *c c* of insulating material for supporting said springs within the box, and an intermediate stationary or immovable block of insulating material for maintaining the springs apart, substantially as described.

2. In an electrical fire-alarm signal-box, the combination, with two springs insulated from each other and forming a part of the electric circuit, of insulators attached to the springs and having openings reaching thereto, and a key for closing the circuit, substantially as and for the purpose described.



3. An electrical fire-alarm signal-box having arranged therein two springs forming a part of the electric circuit, the said springs having attached thereto blocks of insulating material, having openings therein adapting them to receive and interlock with a key, substantially as described.

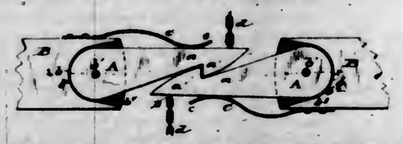
4. An electrical fire-alarm signal-box having arranged therein two springs insulated from each other and forming a part of the electric circuit, the said springs having attached thereto blocks of insulating material formed with openings reaching to the springs, and having bevel-shaped recesses in their outer edges, so as to adapt them to receive and interlock with a key, the end of which is conical or bevel shaped, substantially as described.

5. In an electrical fire-alarm signal-box, the combination, with the box and a suitable lock therefor, of two springs forming a part of the electric circuit, the insulators attached to the springs, and a key having a conical or arrow-shaped end for making electrical contact between the springs, substantially as described.

6. In an electric fire-alarm signal-box, the combination, with the box and a suitable lock therefor, of the blocks *c c* and *d*, the springs C C, the insulators attached to the springs having openings communicating therewith, and a key for closing the circuit, substantially as described.

388,632. WATER-GATE. CLEVELAND J. CHENEY, Lowell, Mass. Filed Apr. 17, 1888. Serial No. 270,966. (No model.)

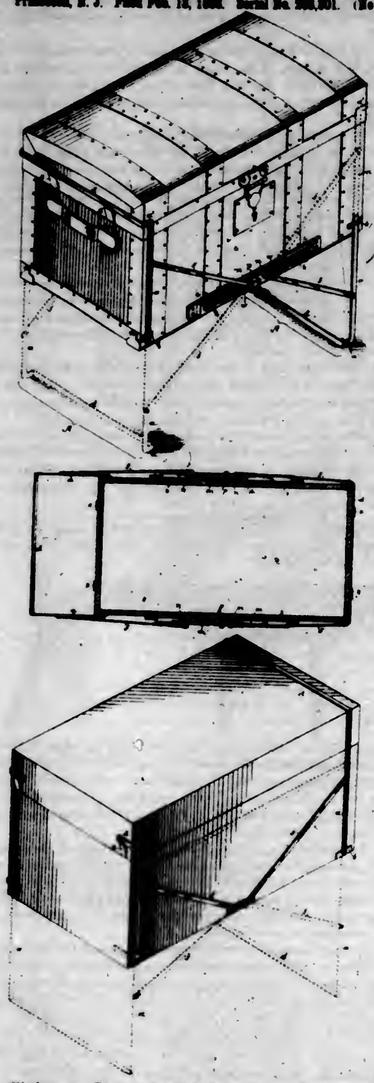
Claim.—1. The combination, with a water-gate, of the axle-shafts carried thereon and provided with terminal eccentric journals, the wheels on said journals, and a mechanism for rotating the axle-shafts, substantially as and for the purpose described.



2. The axle-shafts having terminal eccentric journals, and also having gears, the wheels on said journals, the water-gate carrying the axle-shafts, and the vertical worm-shaft for actuating the gears, substantially as described.

3. The combination of the gate A, the horizontal shafts C C, carried in bearings G G on said gate, said shafts having terminal eccentric journals, *c*, the wheels D D, the gears E E, and the worm-shaft F, substantially as described.

4. The combination, with a water-gate, of the axle-shafts C, having eccentric journals *c*, said shafts being carried in bearings on the gate, and suitable devices for rotating the shafts to remove the gate from its seat, substantially as described.



5. The combination of the gate A, the shafts C C, having journals *c c*, the wheels D D, the gears E E on the shafts, the worm-shaft F, the start H, secured to the gate, and the tracks *a a* for the wheels, substantially as described.

388,633. CAR-COUPLING. GEORGE W. CRICO, Montvale, N. J. Filed Apr. 11, 1888. Serial No. 270,206. (No model.)

Claim.—In a car-coupling, the combination, with the draw-bar having a recess formed near one end, the rear portion of the said recess forming a shoulder, and the under portion of the said draw-bar extending out and forming an arm, of the coupler-heads fitting in the said recess and resting against the shoulder formed in the recess and moving upon and supported by the arm formed by the elongated portion of the draw-bar, whereby, when the cars are coupled, all jar will be taken from the coupler-head, and in turning a curve the coupler-head will be supported by the arm on the draw-bar, substantially as and for the purpose specified.

388,634. ATTACHMENT FOR TRUNKS. CLIFTON W. CLIFTON, Princeton, N. J. Filed Feb. 13, 1888. Serial No. 263,801. (No model.)

Claim.—1. The combination of a trunk with opposite frames carried thereby and constructed to embrace the ends of the lid of the trunk when elevated, said frames being adjustable, so as to project beneath the trunk and provide supports for the same, all substantially as specified.

2. The combination of a trunk with opposite frames pivoted thereto near the lower outer corners, whereby they can be turned down to serve as supports for the trunk or be turned up so to constitute braces for the same, all substantially as specified.

3. The combination of the trunk, the opposite frames carried thereby and adjustable so as to form either supports or braces, and brace-bars serving to confine said frames when adjusted to either of their extreme positions, all substantially as specified.

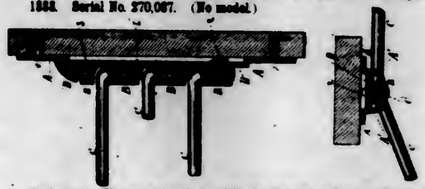
4. The combination of a trunk with vertically-adjustable supporting and bracing frames connected to the trunk at its opposite ends, each frame comprising opposite side bars bent at their upper ends and connected by a transverse bar, all substantially as specified.

5. The combination of a trunk having a shouldered lid with op-

posite vertically-adjustable frames which, when depressed, form supports for the trunk and when raised engage with the shoulders on the lid and confine said lid to the body of the trunk, all substantially as specified.

6. The combination of the trunk having retainer-plates, the opposite frames pivoted to the trunk at the lower outer corners, and brace-rods pivoted to the side bars of the frames and engaging at their free ends with the retainer-plates on the trunk, all substantially as specified.

7. The combination of the trunk, the opposite frames pivoted to the same at its lower outer corners, the brace-bars hung to the side bars of said frames, the retainer-plates for the free ends of said brace-bars, and slotted guide-plates therefor, all substantially as specified.



8. The combination of the trunk having a retaining-plate and slotted guide-plate with the pivoted end frames having brace-bars with locking-pins at their inner ends, said pins being provided with buttons contained between the guide-plate and retainer-plate, all substantially as specified.

9. The combination of the trunk, its guide-plate and retaining-plate, the pivoted end frames and their brace-bars having locking-pins with buttons thereon, and springs for acting upon said buttons to cause the engagement of the pins with the openings in the retainer-plate, all substantially as specified.

10. The combination of the trunk, its retaining-plate and guide-plate, the opposite pivoted end frames and their bracing-bars having locking-pins with buttons thereon, and a pivoted locking-lever constructed to engage said buttons, all substantially as specified.

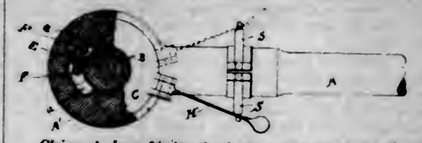
11. The combination of the trunk, the opposite adjustable frames, the brace-bars therefor, and the guide-plate having reversely-inclined slots on opposite sides of the center for receiving and locking said brace-bars in either of their extreme positions, all substantially as specified.

388,635. CLOTHES-DRIER. George Conover, Waterbury, Conn., assignor to the American Ring Company, same place. Filed Apr. 9, 1888. Serial No. 270,067. (No model.)

Claim.—1. The combination, with the slotted wall-plate A, of the bridge-pieces B, made therewith and having intervening spaces, the horizontally-movable rod-arms C, having bent ends adapted to pass between and within the bridge-pieces, and a key, D, adapted to pass within the bridge-pieces and back of the ends of the arms to hold the same in place, substantially as set forth.

2. The combination, with the slotted wall-plate A and the bridge-pieces B, having intervening spaces and made with said plate, of the movable rod-arms C, adapted to be received between and within said bridge-pieces, and the headed key D, grooved lengthwise upon its face and crosswise at intervals corresponding to the space between the bridges, substantially as set forth.

3. The combination, with the slotted wall-plate A and the bridge-pieces B, having intervening spaces and made with said plate, of the movable rod-arms C, adapted to be received between and within said bridge-pieces, and the headed key D, grooved lengthwise upon its face and crosswise at intervals corresponding to the space between the bridges and having the lug 2 on its back, substantially as set forth.

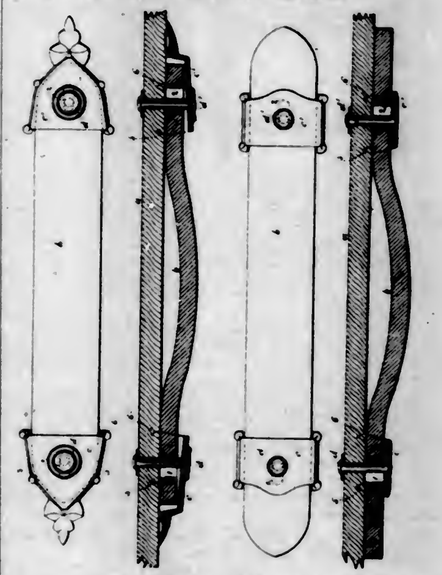


388,636. DEVICE FOR PASTING COP-BOTTOMS ON SPINNING MACHINES. William Cooper, Oldham, and John Cordingley, Hollingwood, County of Lancaster, England. Filed Apr. 19, 1887. Serial No. 236,262. (No model.) Patented in England Aug. 23, 1886, No. 10,737, and in Germany Apr. 30, 1887, No. 42,088.

Brief.—The object of the invention is to improve the paste-boxes employed for pasting cop-bottoms in spinning machinery, in order to apply the paste more efficiently and economically.

Claim.—A device for pasting cop-bottoms, comprising a box to contain the paste, a wheel to revolve partly in the paste in the box and partly out of the box, and an elongated spreading-brush alongside the wheel, substantially as described.

388,637. DRILLING DEVICE. Abner K. Cross, Boston, Mass. Filed Nov. 11, 1887. Serial No. 254,908. (No model.)

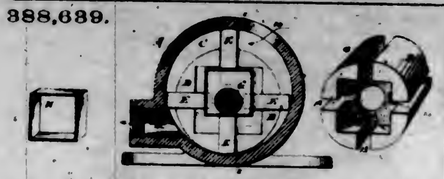


Claim.—1. In a friction-clutch, the combination of a shaft and a lever having a head fitting loosely about the shaft with a friction-roller or clamping-piece placed in a double-tapering chamber formed in either the shaft or the head of the lever, and means whereby the friction-roller may be placed at will in either end of said chamber and there retained in contact with both the shaft and the hub, thus serving to transmit motion from one part to the other, the motion being right or left handed, according to the position of the roller in the chamber.

2. In a reversible friction-clutch, the combination of the spindle B, hub A', provided with a double-tapering chamber, *a a*, and roller E, with the washer C, having the arms F F, and spring-lever H, substantially as and for the purpose specified.

3. In a friction-drill, the combination of the spindle B, feeding-screw K, collar B', and washer D, with a handle, A, its hub A', fitting about the spindle B and provided with a double-tapering chamber, *a a*, the roller E, and the washer C, having the arms F F and spring-lever H, and catch S, all constructed and operating substantially as and for the purpose specified.

388,638. TRUNK-HANDLE. George Croom, New York, N. Y. Filed May 18, 1888. Serial No. 274,249. (No model.)

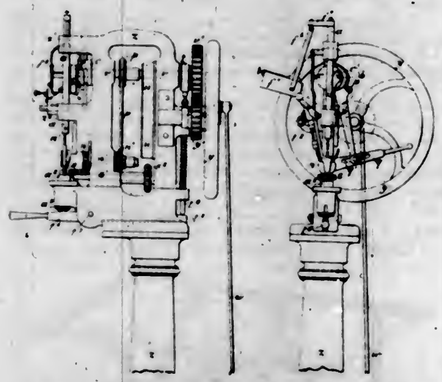


Claim.—1. The combination, with the body or shell of the trunk and a leather handle, of metal end caps or bridge-pieces having penetrating-points made integral therewith and adapted to pass into the body of the trunk, and rivets or bolts passing through the end caps, leather handle, and body of the trunk to hold the parts together, substantially as specified.

2. The combination, with the body or shell *a* of the trunk, of the leather handle *b*, slotted at its ends, the metal end caps or bridge-pieces *c c'*, having penetrating-points upon their under side and made integral therewith, and adapted to pass into the body of the trunk, and riveted pins or bolts *d d'*, passing centrally through the metal end caps, and through the slots in the handle, and through the body of the trunk to hold the parts securely together and in place, substantially as set forth.

388,639. ROTARY PRESSURE-BLOWER. Gilbert Crowell, Brooklyn, N. Y. Filed Nov. 30, 1887. Serial No. 256,148. (No model.)

Claim.—1. In a rotary engine, the combination, with its casing, hub, and blades, of a spring of hollow polygonal form adapted to bear upon each of the blades, substantially as described.



2. The herein-described spring, consisting of a plurality of leaves connected together in hollow polygonal form, each leaf constituting an independent spring.

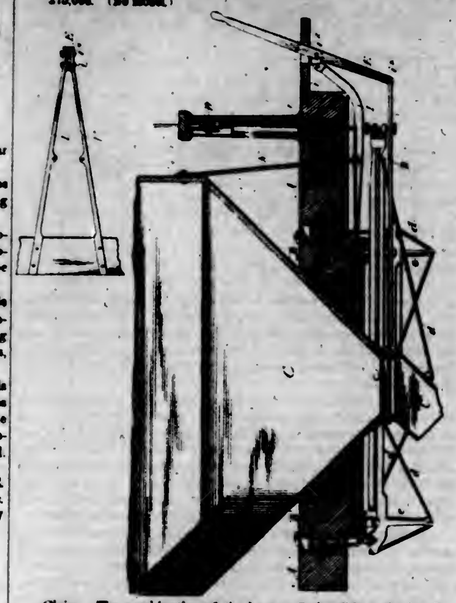
3. In a rotary engine, the combination, with its casing, its revoluble hub, and four blades carried thereby, of a spring of hollow polygonal form adapted to bear upon each of the blades, and also to be moved independently thereof, substantially as described.

4. The combination of a cylinder or casing, a hub revoluble therein, carrying two or more blades adapted to reciprocate with respect to the hub, and said hub provided with a recess, I, and a spring of hollow polygonal form seated in said recess to bear upon said blades, substantially as described.

5. The combination, with a cylinder, a hub provided at its ends with recesses I, and in its periphery with radial slots, and blades seated in said slots and adapted to reciprocate independent of the hub, of a spring of hollow polygonal form seated in each of said recesses and adapted to bear upon the blades, substantially as described.

388,640. NAILING-MACHINE FOR BOOTS OR SHOES. John R. Cutlan, Wellingborough, County of Northampton, England. Filed Dec. 9, 1887. Serial No. 257,412. (No model.) Patented in England May 19, 1884, No. 7,202.

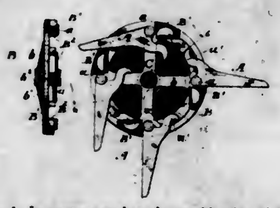
Claim.—1. In a boot-nail-driving machine, the combination, with the plate *g*, having the slot *g'* and an aperture, *o*, of the slide *h*, having the slot *f* at an angle to the slot *g'*, and also having the slot transversely to the slot *g'*, substantially as set forth.



2. In a boot-nail-driving machine, the combination, with the slide *h*, having the slot *i* therein for supplying one nail at a time under the nail-driver, of the cam *c*, the plunger *a*, the nail-driver *a'*, the rocking nail-reservoir f^{x}, and the forked arm f^{5}, the said plunger *a* rocking the nail-reservoir by means of said forked arm f^{5}, substantially as set forth.

3. In a boot-nail-driving machine, the combination, with a cam, *c*, nail-reservoir f^{x}, nail-feed-regulating slide *h*, and slotted plate *g*, of a tube, *n*, plunger *a*, carrying the nail-driver *a'* at its lower end and having the forked arm f^{5} connected to its upper end for rocking the nail-reservoir, and the loose jaws *k* and *l*, kept closed by spring *m*, substantially as set forth.

4. A boot-nail-driving machine worked with the main actuating-axis *v*, having the two eccentrics *t* and *p* and the double cam *c* thereon, a nail-driver actuated from the eccentric *t*, and the regulating-wheel operated with the eccentric *p*, and a nail-feeding device operated by the double cam *c*, substantially as set forth.



5. A boot-nail-driving machine constructed with a gripping device consisting of an arm, f^{6}, actuated by eccentric *t* through the rod *t'*, having spring f^{9} inserted in the slotted end, an upright rod, f^{8}, gripped at f^{9}, and the lever-arm f^{7}, which supports the rest a^{2} at the moment the driver *a'* is driving in the nail, substantially as set forth.

388,641. MEANS FOR OPERATING THE SLIDES OF GRAIN-HOPPERS. John Dahl, Chicago, Ill. Filed May 25, 1888. Serial No. 275,008. (No model.)

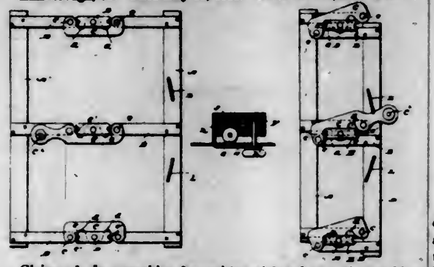
Claim.—The combination of the hopper C, the slide *c*, the bar D, attached at one end to the slide *c* and pivoted at the other to the lower end of the lever E, the said lever itself pivoted between the outer ends of the curved bars I I', the said curved bars themselves having their inner ends fastened to the square frame B, and the vertical bars *L*, connecting the middle portions of said curved bars with the hopper C, adapted to operate the slide *c*, substantially as described.

388,642. PACKING MECHANISM FOR GRAIN-BINDERS. John S. Davis, Cleveland, Ohio. Filed Nov. 5, 1887. Serial No. 254,603. (No model.)

Claim.—1. In a rotary packer, the combination of the revolving disk, the arms A, pivoted thereon, the fixed cam upon which the arms trail, and the yielding noiseless cushions on the disk, against which the arms strike when thrown out by the cam, substantially as hereinbefore set forth.

2. The combination of the packer-casing consisting of a stationary and a revolving disk, a cam on the stationary disk, arms pivoted on the revolving disk and trailing over the cam, and yielding cushions against which the arms fall when released by the cam, substantially as hereinbefore set forth.

3. The combination of the disk and the ductile-metal clips rising therefrom with the cushion-blocks held in close embrace between the disk and clips, the latter being so firmly pressed against the blocks as to constantly hold them in place, substantially as set forth.



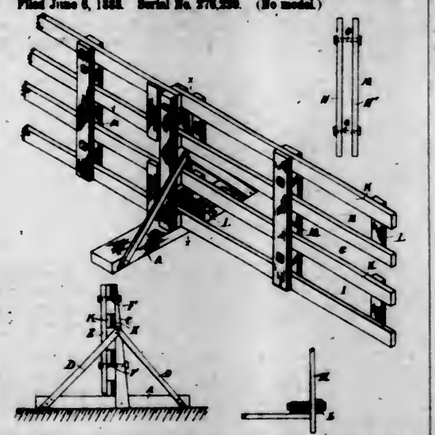
4. The combination of the cast-metal skeleton frame or spider *b* with the sheet-metal disk *b'*, embracing the hub and secured to the rim of the spider, substantially as described.

5. The combination of the cast-metal skeleton frame or spider *b* and the sheet-metal disk *b'*, secured thereto, as described, with the annular rim or ledge b^{3}, covering the joint of the spider and disk at their edges, substantially as hereinbefore set forth.

6. The combination of the revolving packer-disk carrying the pivoted arms and cushions with the stationary disk having the fixed

cam-track and the roller *d'*, arranged substantially as and for the purpose hereinbefore set forth.

388,648. FENCE-MAKING MACHINE. ALEXANDER K. DUNCAN, Hillsborough, Pa. Filed May 18, 1888. Serial No. 274,207. (Model.)



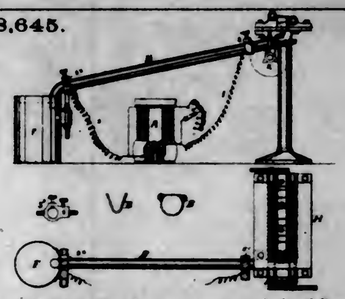
Claim.—1. In a machine for making picket fences, the combination of a pair of bars, links pivotally connected to the bars, twister-plates pivoted centrally to the links and having perforations in each end thereof for the reception of the wires, and a lever for moving the bars toward and from one another, substantially as described, for the purpose set forth.

2. In a machine for making picket fences, the combination of a pair of bars, each having a series of arms fixed thereto, links pivoted to the ends of the arms and having notches or recesses formed in one edge thereof, a lever pivoted to an arm of one bar and to a corresponding arm of the other bar, and twister-plates pivoted centrally to the links at a point between the notches thereof, the ends of said plates having wire-receiving openings and spanning the notches or recesses in the links, substantially as and for the purpose described.

3. The combination of a tension-bar having a series of recesses, a roller fitted in each recess, and a yielding friction-plate arranged to bear against wires passing between itself and the roller and provided with a regulating-screw, substantially as and for the purpose described.

4. The combination of a tension-bar having a series of recesses formed in one of the lateral faces thereof, an annularly-grooved roller fitted in each recess of the bar, and a yielding friction-plate secured at one end to the bar and having a regulating-screw passing through its unconfined or free end, substantially as and for the purpose described.

388,644. PORTABLE FENCE. ELIJAH DEBOTH, Newark, Ohio. Filed June 6, 1888. Serial No. 276,230. (No model.)



Claim.—1. A portable fence formed of a base-board, a post secured thereto, a movable post in parallel relation therewith, and bolts passed through each post, in combination with separable and removable panels held in vertical position between the posts, and from horizontal movement by strips attached to each section of the panels, as and for the purpose set forth.

2. A portable fence formed of separable panels held in fixed relation by a central clamp and in vertical position by being clamped between posts, as and for the purpose set forth.

388,645. APPARATUS FOR HARDENING AND TEMPERING BY ELECTRICITY. PHILIP DIXON, Elizabeth, N. J. Filed Jan. 21, 1888. Serial No. 261,443. (No model.)

Claim.—1. An apparatus for hardening or tempering, consisting

388,645.

of the combination of a chute or conveyer, a feeder delivering the articles to be hardened or tempered thereto, a source of electric currents having its circuit through the chute or conveyer, whereby the latter is heated, an agitator or vibrator moving the conveyor and causing the articles to pass through the same, and a vessel for containing the cooling bath, into which the articles may be delivered from the chute.

2. In an apparatus for hardening or tempering, the combination, with a chute or conveyer through which the articles to be operated upon may be passed, of a source of electricity having its respective poles connected with different points in the length of said chute or conveyer.

3. In an apparatus for hardening or tempering needles and similar articles, the combination of a heating chute or conveyer, a source of electric currents having its circuit through said conveyer, and a vibrator applied to the chute, substantially as described.

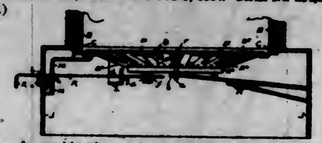
4. In an apparatus for hardening or tempering needles and similar articles, the combination of an inclined heating chute or conveyer, and a source of electric currents having its circuit through said conveyer.

5. In an apparatus for hardening or tempering needles and similar articles, the combination of a heating chute or conveyer, a source of electric currents having its circuit through said conveyer, a vibrator applied to the chute, and a transparent cover for said chute or conveyer.

6. The combination, in a device or apparatus for hardening or tempering needles or similar articles, of a chute or conveyer through which the articles are to be passed, a source of electricity having one pole connected with the chute at a given point, and an adjustable contact device connected with the other pole of the source, through which connection may be made at different points along the length of the chute.

388,646. TOBACCO-FRAME. JOSEPH F. DEREY, St. Vincent, Ky. Filed May 14, 1888. Serial No. 273,879. (No model.)

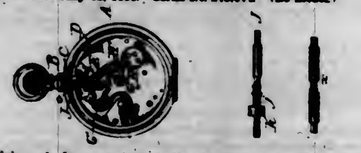
Claim.—1. The rack comprising the central longitudinal bar and the frame supported upon the uprights or supports connected to said bar and frame and disposed in pairs, of which the end ones incline toward each other in the direction of the length of the rack, substantially as set forth.



2. The rack consisting of the single central longitudinal piece or bar having applied transversely thereto, near its ends, cross pieces or bars adapted to engage with the usual bolster-standards of an ordinary wagon running-gear, to which single longitudinal bar or piece are connected the lower ends of obliquely-disposed uprights or legs, also connecting with and supporting in an elevated position a horizontal rectangular frame, substantially as set forth.

3. The rack consisting of the central longitudinal bar or piece provided near its ends with transverse or cross pieces having notched or recessed ends, and the frame secured or supported upon obliquely-disposed supports or uprights, of which the end ones incline toward each other in the direction of the length of the rack, substantially as set forth.

4. The rack consisting of the central longitudinal bar or piece provided with cross pieces or bars having notches in their ends, and the rectangular horizontal frame provided with a chain at its middle,



about and at one end, and secured upon obliquely-disposed supports or uprights, the lower ends of which are secured to the said longitudinal bar and to blocks or cleats interposed between said uprights or supports, substantially as set forth.

388,647. FIRE-GRATE FOR FURNACES, STOVES, &c. CALVIN C. DUNKLEE, Boston, Mass. Filed Oct. 3, 1887. Serial No. 251,303. (No model.)

Claim.—In combination, an inner circular grate, A, having a horizontal rectangular eye, *d*, and a central pivot, *a*, turning in a bearing, *b*, of a stationary support, H, an outer annular grate, B, surrounding inner grate, A, and having a vertical circular eye, *h*, and a rest, G, for grate A, supports F at and about a circular opening, C, for grate B, an operating-rod, K, and a fixed support, L, for said rod K, having a vertical circular eye, *g*, said rod extending through and engaging said several eyes *d*, *h*, and *g*, whereby, through the rod K, the grates A B can be rotated on their said respective supports simultaneously in opposite directions and the inner grate dumped, all substantially as described, for the purpose specified.

388,648. STEM-WINDING WATCH. SILAS A. DURGIN, Sheldon, Dak. Filed May 12, 1888. Serial No. 273,674. (No model.)

Claim.—1. In a watch, a winding-bar having an adjustable collar for releasing the snap-spring, substantially as described.

2. A winding-bar for watches having a partially-threaded stem, in combination with a threaded collar upon such stem adapted to bear upon the snap-spring, substantially as and for the purpose set forth.

3. In combination with a hunting-case watch having stem winding and setting mechanism, a winding-bar having a collar for operating to release the case-snap, and connected to the yoke and winding-pinion, whereby the winding and setting mechanism and the case-releasing spring are operated directly by said bar without setting-levers, substantially as described.

388,649. LIQUID-FUEL BURNER. CHARLES J. ECKSTEIN, Grand Crossing, Ill. Filed Feb. 17, 1887. Serial No. 227,917. (No model.)

Claim.—1. The combination, with the fire-box of a stove or furnace and a suitable delivery-pipe for liquid fuel, of a liquid-fuel burner comprising a top plate extending over the fire-box and provided with an opening for the escape of the products of combustion, and a burner-bar immediately beneath said top plate, said bar having a recess formed lengthwise thereof, and being closed except for a space adjacent its lower front edge, substantially as described.

2. In a liquid-fuel burner, the combination, with a suitable delivery-pipe, of a burner-bar having a recess formed lengthwise thereof in its lower front portion, and a depending front plate adapted to close the front of the burner-bar, substantially as described.

3. The combination, with the fire-box of a stove or furnace, and with a suitable delivery-pipe, of a liquid-fuel burner comprising a top plate extending over and completely closing the fire-box and provided with an opening for the products of combustion, a burner-bar suspended beneath said top plate and completely within the fire-box, and provided along its lower portion with an overflow-edge adapted to receive and distribute the liquid fuel, and a deflecting-plate extending from a point near the lower portion of the burner-bar to the opening of the top plate, substantially as described.

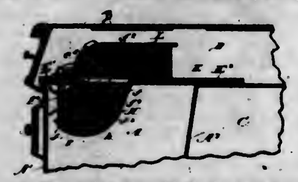
4. In a liquid-fuel burner, the combination, with the burner-bar having a shallow channel extending lengthwise thereof and having an overflow-edge at its lower front portion, of a deflecting-plate extending from the lower front portion of said burner-bar to the upper back part thereof and in proximity thereto, so as to form a combustion-chamber between said bar and plate, substantially as described.

5. In a liquid-fuel burner, the combination, with a fuel-delivery pipe, of a burner-bar having its lower front portion provided with a shallow channel and an overflow-edge lengthwise thereof, a front plate adapted to close the front of the burner-bar, and a deflecting-plate extending from beneath and in front of said burner-bar to a point behind the same and separated a slight distance therefrom, substantially as described.

6. In a liquid-fuel burner, the combination, with the fuel-delivery pipe, of a recessed burner-bar having its lower front portion provided with a slightly-upturned overflow-edge, and having its main body extending upwardly, and a supporting-plate, upon which said burner-bar is removably held, substantially as described.

7. In a liquid-fuel burner, the combination, with a suitable supporting-plate adapted to cover the fire-box of the stove, of a recessed burner-bar provided at its lower front portion with an overflow-edge, a dependent front plate for closing the front of the burner-bar, and a deflecting-plate, said several parts being carried by the supporting-plate, substantially as described.

8. In a liquid-fuel burner, the combination, with the supporting-plate adapted to cover the top of the fire-box and provided with a central recess, of a burner-bar arranged to be slipped through said recess and detachably sustained by the supporting-plate, substantially as described.



9. The combination, with the fire-box of a stove or furnace and a liquid-fuel burner comprising a burner-bar adapted to fit completely within the fire-box, of a supporting-plate for sustaining said burner-bar, said plate being adapted to cover the fire-box and being formed of separate sections suitably connected together, whereby the burner and the top plate can be readily inserted into and removed from the stove or furnace, substantially as described.

10. In a liquid-fuel burner, the combination of a suitable supporting-plate provided with a depending front plate or wall, a recessed burner-bar having an upturned distributing-edge in proximity to said depending front wall or plate, and a deflecting-plate extending from in front of the lower portion of the burner-bar to a point behind the top thereof, said deflecting-plate being provided with end walls extending to the supporting-plate, substantially as described.

11. In a liquid-fuel burner, the combination, with a burner-bar and a suitable plate for sustaining said bar and adapted to cover the fire-box of the stove, of an upper top plate provided with a register-valve, substantially as described.

12. In a liquid-fuel burner, the combination, with a burner-bar, of a top plate provided with an expanded liquid-fuel chamber, G, and suitable delivery and discharge pipes leading into and from said chamber, substantially as described.

388,650. LIQUID-FUEL BURNER. CHARLES J. ECKSTEIN, Grand Crossing, Ill. Filed Feb. 17, 1887. Serial No. 227,918. (No model.)

Claim.—1. The combination, with the fire-box of a stove or furnace, of a liquid-fuel burner comprising a suitable fuel-delivery pipe, and a burner-bar extending from end to end of the fire-box and movably sustained therein, and provided upon its exterior with ribs adapted to receive and distribute the fuel, substantially as described.

2. In a liquid-fuel burner, the combination, with a suitable fuel-delivery pipe and with suitable supports, of a burner-bar journaled in said supports and provided with a series of longitudinal ribs having slightly-upturned distributing-edges, substantially as described.

3. In a liquid-fuel burner, the combination, with a suitable fuel-delivery pipe and with suitable supports, of a burner-bar journaled in said supports and provided with a series of recesses, *f*, and intermediate ribs, *f' f² f³*, substantially as described.

4. In a liquid-fuel burner, the combination, with a suitable fuel-delivery pipe and suitable supports, of a burner-bar, F, journaled in said supports and provided with the longitudinal recesses *f*, the intermediate ribs, and the end plates, *f⁴*, substantially as described.

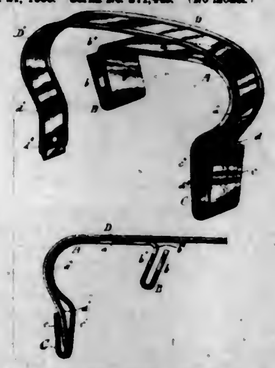
5. In a liquid-fuel burner, the combination, with a suitable top plate, E, and deflecting-plate H, of the end plates, *h*, and the burner-bar F, removably journaled in said end plates, substantially as described.

6. In a liquid-fuel burner, the combination, with the top plate, E, of the burner-bar F, suitable supports wherein said burner-bar is removably journaled, and a guard-plate, I, substantially as described.

7. In a liquid-fuel burner, the combination, with a suitable plate, E, arranged over the fire-box, and a suitable burner-bar beneath said plate, of a deflecting-cover located above the top plate and extending over the burner-bar, substantially as described.

8. In a liquid-fuel burner, the combination, with the top plate, E, having an opening, E^3, therein, and a burner-bar beneath said opening, of a deflecting-cover, L, extending backwardly over the opening E^3 on the top plate, E, substantially as described.

9. In a liquid-fuel burner, the combination, with a suitable top plate, E, having an opening, E^3, therein for products of combustion, and having a suitable burner-bar beneath said opening, of a deflecting-cover, L, extending above said opening in the top plate and provided at its front with a register-valve, substantially as described.

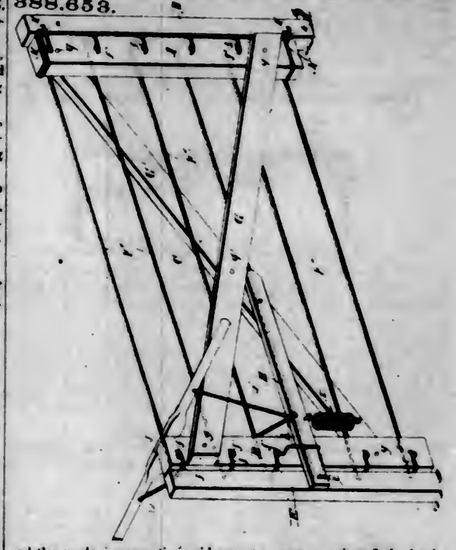


388,651. PAPER-CUTTER. LEO BERLACH, St. Louis, Mo., assignor to the American Roll Paper Company, same place. Filed Jan. 3, 1888. Serial No. 259,507. (No model.)

Claim.—1. In combination with the ends or standards in which the roller is journaled, lugs on the ends or standards, a knife having end portions fitting in the lugs in a horizontal position, arms having slot-and-pin connection with the ends of the knife, and a spring or weight for operating the arms, substantially as and for the purpose set forth.

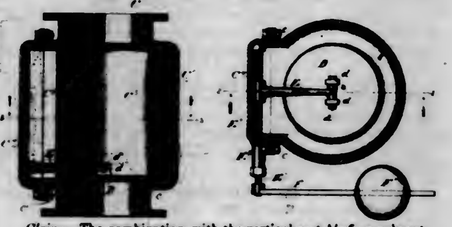
2. In a paper-cutter, the combination of the ends provided with lugs 4, arranged in horizontal series, as shown, roller journaled in the ends, knife provided with ends fitting in the lugs, lever pivoted to the ends or standards and having slot-and-pin connection with the ends of the knife, projections on the arms, and springs connected to the ends or standards, the free ends of which bear against the projections on the arms, substantially as and for the purpose set forth.

388,652. FORMING-TOOL. WILLIAM W. BIERNSON, Astoria, Ill. Filed Apr. 21, 1888. Serial No. 271,463. (No model.)



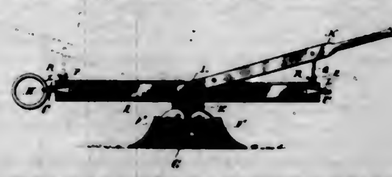
Claim.—The forming-tool described, comprising a curved metal bar, A, having its ends bent in opposite directions to form two sockets, B and C, the openings of said sockets being at the convex side of the bar, substantially as described.

388,653. GATE. DAVID BERLAND, Cedar Hill, Tex. Filed Apr. 17, 1888. Serial No. 270,898. (No model.)



Claim.—The combination, with the gate composed of the latch-upright, hinge-upright, longitudinal wires, and cross-braces, of the spring-depressed latch H, pivoted to the brace G just in front of the crossing part of the opposite brace, the double-armed lever J, pivoted through its center to the inner surface of the top of the latch-upright,

388,653.



and the cords *j*, connecting said arms to a proper point of the latch, substantially as specified.

388,654. STEAM-EXHAUST-PIPE VALVE. JOHN BRWOOD, Chicago, Ill., assignor of two-fifths to James G. Bestering, same place. Filed Apr. 3, 1888. Serial No. 269,432. (No model.)

Claim.—The combination, with the vertical part A' of an exhaust-pipe leading from a steam-engine and a branch pipe, B, taken from said exhaust-pipe, of the valve C, located in the vertical part of the exhaust-pipe beyond the point at which the branch B is taken, said valve C comprising the laterally-recessed shell C', provided with a horizontal seat, *c'*, the rotatable shaft E', passing through a stuffing-box, E^3, the valve D, the arm E, secured to the shaft E' and pivotally attached to the middle of the valve proper, D, the exterior weight-arm, F, and the movable weight F', substantially as described.

388,655. REVERSIBLE PLOW. CHARLES H. FARLEY, Addison, W. Va. Filed Apr. 20, 1888. Serial No. 271,264. (No model.)

Claim.—1. In a reversible plow, the combination of the double-ended beam, the standard depending from the center of the same, the right and left hand plowshares arranged in reverse positions, and the longitudinal draft-rod on one side of the plow-beam and having the traveling draft-ring, substantially as described.

2. The combination, in a reversible plow, of the double-ended beam, and the draft-rod arranged longitudinally on one side thereof and having the clevises formed in its ends, the ends of said draft-rod being secured to and vertically adjustable on the ends of the plow-beam, substantially as described.

3. The combination, in a reversible plow, of the double-ended beam, the longitudinal draft-rod having the clevises formed in its ends and secured to the ends of the beams, said clevises having the laterally-adjusting notches, and the draft ring or link arranged on the draft-bar and adapted to be engaged by the notches in either of the clevises, substantially as described.

4. The combination, in a reversible plow, of the double-ended beam, the longitudinal draft-rod having its ends secured to the ends of the beam and forming the clevises, the latter having the notches on their inner sides, the draft ring or link adapted to slide on the draft-rod and engage either of the clevises, and the locking-plates I, pivoted to the draft-rod at its ends, for the purpose set forth, substantially as described.

388,656. WIRE ROPE OR CABLE. HENRY W. FARLEY, Urbana, Ill. Filed May 3, 1888. Serial No. 273,076. (No model.)

Claim.—1. A wire rope or cable having an inclosing-covering of alternate metallic and flexible abutting sections.

2. A wire rope or cable having incasing-rings molded upon the strands thereof and locked thereto by projections applied to the rope, substantially as described.

3. A wire rope or cable having metal rings cast upon the strands thereof at suitable distances apart in fixed relation thereto, and having a bound covering of flexible lubricating material between the said rings, whereby the entire surface of the rope is covered by alternating metal and non-metallic casing, substantially as described, for the purpose specified.

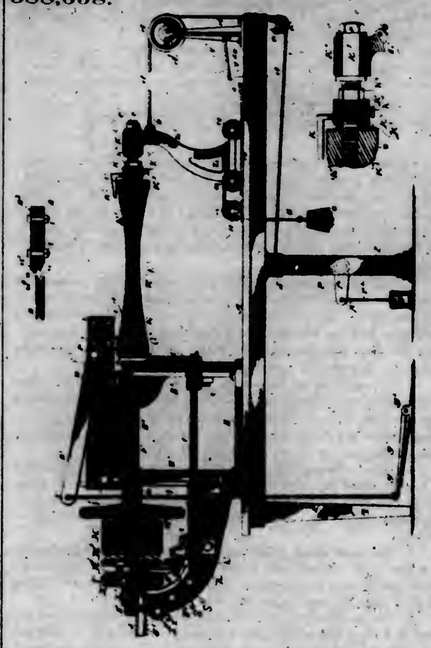
4. A wire rope or cable having metal rings cast upon the strands thereof and in fixed relation thereto at suitable distances apart, and having a flexible material bound upon the unringed surface of the rope of a diameter less than that of the said rings, whereby the said flexible covering is protected from wear, as herein set forth.

5. A wire rope or cable having metal rings cast upon the strands thereof at suitable distances apart, and locked in relation thereto by metal pins or wedges driven into the rope between its strands and projecting from its surface into the metal of the ring, substantially as described.

6. The improved article of manufacture herein described, consisting of a wire rope having metal rings cast upon the surface of the strands thereof at suitable distances apart, and having a lubricating material consisting of cotton waste bound upon the unringed parts by means of a wire tie, as herein set forth.

388,657. POT FOR CONDIMENTS AND THE LIKE. ROBERT H. FERLAY, Glasgow, County of Lanark, Scotland. Filed Apr. 18, 1888. Serial No. 271,029. (No model.) Patented in England Oct. 28, 1887, No. 14,689.

Claim.—The combination of a tube or cylinder, *a*, open at both ends, neck *b*, fitted within its upper end, a closure for the neck, casing *c*, having a ledge, *f*, at its lower end for the bottom of cylinder *a* to rest on, cover *g*, inclosing the neck *b* and secured to the casing *c*, and a piston or expeller contained within the body *a*, substantially as shown and described.



388,658. MACHINE FOR MAKING WIRE SPRINGS. OSCAR R. FOSTER, Utica, N. Y. Filed Mar. 31, 1888. Serial No. 269,044. (No model.)

Claim.—1. In a spring-winding machine, the combination, with a shaft and a former secured thereto, of a movable lug mounted on the former, a latch arranged on the former in the path of the wire and caused by the wire to force the lug outward, and a tripping mechanism actuated by said lug for arresting the motion of the shaft, substantially as set forth.

2. In a spring-winding machine, the combination, with a shaft and a former secured thereto and provided with a device arranged to be actuated by the pressure of the spring-wire to be wound on the former, of a clutch on the shaft and intermediate mechanism actuated by the device on the former for operating the clutch, substantially as set forth.

3. In a spring-winding machine, the combination, with a former mounted on a shaft and carrying a spring-actuated lug, of a latch arranged on the former in the path of the wire to be wound and caused by the wire to force the lug outward, and a clutch on the shaft and

388,658.

intermediate mechanism actuated by the lug moving the clutch, substantially as set forth.

4. In a double-cone-spring-winding machine, the combination, with a shaft, a truck, and a sectional former, one section of which is secured to the shaft and the other section mounted on the truck, of a loose pulley mounted on the shaft, a clutching device arranged to interlock with the pulley, a clutch-operating device, and a lug and a latch arranged on one section of the former, the latch being in the path of the wire to be wound and caused by the wire to force the lug outward to engage the clutch-operating device, substantially as set forth.

5. In a wire-spring-winding machine, the combination, with a housing-frame, a shaft carrying a section of the spring-former, and a movable truck carrying another section of the former, of mechanism for rotating the former, and tripping devices actuated by contact with a projection carried by the former for arresting the motion of the shaft, substantially as set forth.

6. In a cone-spring-winding machine, the combination, with a shaft carrying one section of a spring-former, of a truck, a stud journaled in a bearing on said truck, a section of the spring-former secured to said stud, a collar secured on the stud, and a locking-finger secured to the collar and overhanging the end of the adjacent spring-former section, substantially as set forth.

7. In a cone-spring-winding machine, the combination, with a former composed of two separable sections, a shaft to which one of said sections is attached, a stud to which the other section is attached, and a truck having a bearing in which said stud is journaled, of a bent locking-finger attached to the stud and overlapping the end of the adjacent former-section.

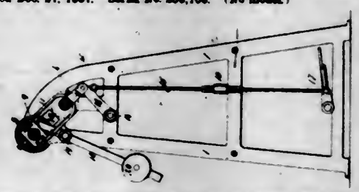
8. The combination, with a frame, a shaft journaled therein, a former-section secured to one end of said shaft, a loose pulley mounted on the shaft, a clutch arranged to engage the pulley, a truck having a bearing, a stud journaled in said bearing, and a former-section secured to the stud, of a lug and a latch arranged on one section of the former, the latch being in the path of the wire to be wound and caused by the wire to force the lug outward, and clutch-operating devices actuated by the lug, substantially as set forth.

9. The combination, with the shaft mounted in a stationary frame, a stud journaled in a movable support, and former-sections secured to said shaft and stud, of a pulley loosely mounted on the shaft, a sliding clutch secured on said shaft, a lug and a latch arranged on the former-section secured to the shaft, the latch being in the path of the wire and caused by the wire to force the lug outward, and clutch-operating devices moved by the lug for operating the clutch, substantially as set forth.

388,659. ORE-CONCENTRATOR. WILLIAM A. FRANK and THOMAS WEEKS, Pinal, Ariz. Filed Aug. 3, 1886. Renewed Dec. 12, 1887. Serial No. 257,682. (No model.)

Claim.—1. The combination, in an ore-concentrator, of a trough-body having a plane bottom with a series of openings through it, a series of screens secured upon the said bottom across the said openings, and perforated with fine holes located in lines along the trough, and provided with V-shaped strips rising abruptly above the plane of the trough-bottom and located beside the lines of holes, substantially as shown and described.

2. The combination of a trough-body having a plane bottom with a series of openings through it, a series of sheet-metal plates removably secured to the said body-bottom across the said openings and perforated with fine holes located in lines along the trough, and slanting-sided strips secured upon each of the said plates along beside the said holes, substantially as shown and described.



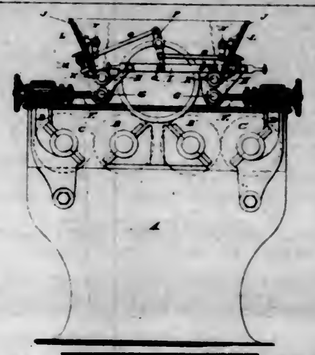
3. A trough having its bottom divided into a series of spaces alternately plane and grooved, and having fine perforations located in lines along the bottoms of the said grooves, the sides of the said grooves being slanted and rising abruptly above the plane portions of the bottom, substantially as shown and described.

4. The combination of a trough having fine perforations located in a longitudinal line in its bottom, and a gate fitted to slide across the trough close beneath the perforated portion, and having its front edge diagonal to the line of holes, substantially as shown and described.

5. The combination of a trough having fine perforations located in a line in its bottom, and a gate fitted to slide close beneath the perforated portion in a direction transverse to the said line and having its front edge diagonal to the said line.

6. The combination, in an ore-concentrator, of a sheet-metal bottom, D, having lines of upwardly-tapering perforations in it, and slanting-sided strips E, secured upon the said bottom beside the lines of perforations, substantially as shown and described.

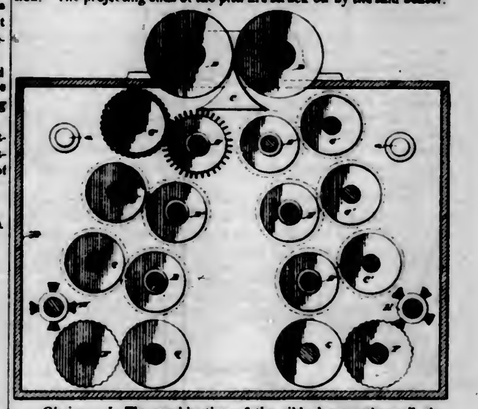
388,660. IRONING-MACHINE. GEORGE J. FRITZ, St. Louis, Mo. Filed Dec. 27, 1887. Serial No. 259,106. (No model.)



Claim.—1. In an ironing-machine, the combination of the frame having inclined slots 10, a shaft mounted in fixed bearings, a movable shaft, roller on the shafts, sliding boxes in which the movable shaft is journaled, and means for shifting the movable shaft, consisting of an independently-movable lever pivoted to the frame at 19, and having a bearing at one end against the under side of one of the sliding boxes, and a weight at the other end of the lever, said movable shaft being moved by the said lever in one direction, and yokes secured to the boxes, pivoted arms connected to the yokes, and a treadle, to which the arms are connected, for moving the shaft in the other direction, substantially as and for the purpose set forth.

2. In an ironing-machine, the combination of the shaft 2, mounted in fixed bearings, movable shaft 3, rollers on the shafts, sliding boxes 9, fitting in slots 10 of the frame, yokes 11, pivoted to the boxes and encompassing shaft 2, arms 13, pivoted to the yokes and to the frame, operating-treadle, and adjustable rods 16, connecting the arms to the treadle, substantially as shown and described.

388,661. ROLLER GRINDING-MILL. WILLIAM D. GRAY, Milwaukee, Wis., assignor to R. P. Allis & Co., same place. Filed July 25, 1884. Serial No. 138,751. (No model.)



Claim.—In a roller grinding-mill, the combination of a hopper, a feed-controlling gate, a lever, P, connected by intermediate devices with said gate, a stationary grinding-roll, a movable grinding-roll, a roll-adjusting mechanism embracing a movable bar or arm, l, and widely-separated stops or shoulders *a* and *b* on said arm to actuate the gate-controlling lever, whereby the rolls are closed before the gates are opened and the rolls opened before the gates are closed.

388,661

388,662. MACHINE FOR DISINTEGRATING HEMP, RAMIE, &c. JOSHUA J. GREEN, New York, N. Y. Filed Feb. 6, 1888. Serial No. 263,154. (No model.)

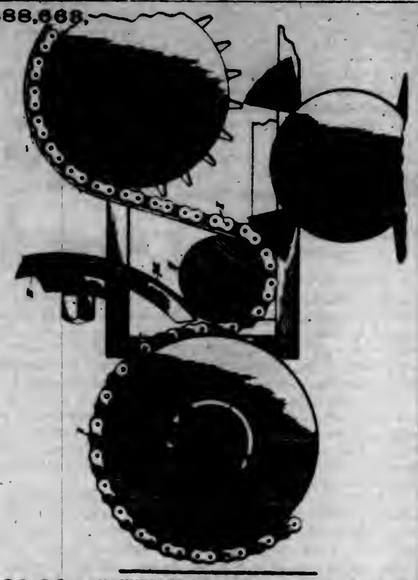
Brief.—The stalk is split into halves by a knife, and each half passes down to similar devices. Said devices consist of a ribbed presenting-roll, between which and a tucker-blade roll the stalk is broken, and a beater within the tucker-blade roll, revolving in a contrary direction. The projecting ends of the pith are struck off by the said beater.

Claim.—1. The combination of the ribbed presenting-roll, the tucker-blade roll, and the beater, substantially as and for the purposes hereinbefore set forth.

2. The combination of the feed-rolls, the splitting-knife, the ribbed presenting-roll, the tucker-blade roll, and the beater, substantially as and for the purposes hereinbefore set forth.

3. The combination, with the ribbed presenting-roll, of the tucker-blade roll, consisting of end disks, *a*, and connecting-blades *b*, and the beater located within and rotatable independently of said tucker-blade roll, substantially as and for the purposes hereinbefore set forth.

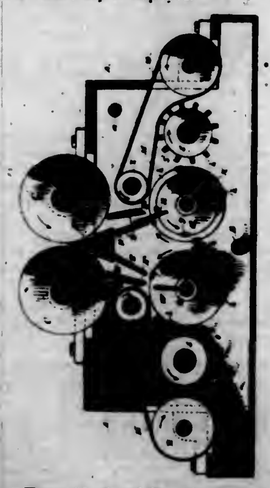
388,663. MACHINE FOR DISINTEGRATING HEMP, JUTE, RAMIE, &c. JOSHUA J. GREEN, New York, N. Y. Filed Feb. 6, 1888. Serial No. 263,155. (No model.)



Brief.—As the stalk enters the machine a splitting-knife divides it into two halves, each of which, as it passes beyond said knife, is operated upon by duplicate machinery at the ends of the frame. Said machinery consists, essentially, of a feed-apron and a skeleton apron moving more rapidly than the feed-apron; and the stalk is carried between these aprons and bent sharply around a bar, thus causing the pith to break into sections and to protrude between the bars of the skeleton apron, to be struck off by a revolving beater.

Claim.—1. The combination of the feed-apron, the skeleton apron, the breaker bar or roll, and the beater, substantially as and for the purposes hereinbefore set forth.

2. The combination of the guide-plate, the feed-apron, the breaker-bar, the beater, and the skeleton apron, substantially as and for the purposes hereinbefore set forth.



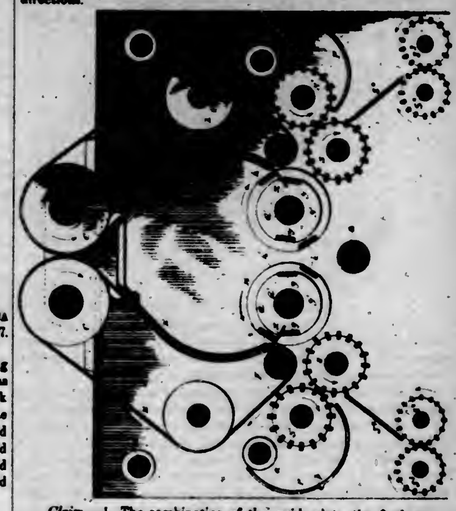
3. The combination of the feed-rolls, the splitting-knife, the guide-plate, the feed-apron, the skeleton apron, the breaker-bar, and the beater, substantially as and for the purposes hereinbefore set forth.

388,663.

388,664. MACHINE FOR TREATING HEMP, RAMIE, &c. JOSHUA J. GREEN, New York, N. Y. Filed June 16, 1888. Serial No. 277,367. (No model.)

Brief.—The stalk is split into two halves, each half passing down between guide-plates, the lower edge of one of which serves as a breaker, about which the stalk is sharply bent. Thence the stalk passes between an apron and a scraping-roll moving faster than the feed devices, thus putting a tension on the stalk. The projecting end of the pith, as it separates from the stalk at the breaker, is nipped and broken off by a beater having a fixed blade within; or a compound beater consisting of two beaters, one revolving within the other and in an opposite direction, may be employed.

Claim.—1. The combination of the guides, the breaker, the beater, the tension-roll, and the apron, substantially as and for the purposes hereinbefore set forth.



2. The combination of the feed-rolls, the splitting-knife, the guides, the breaker, the beater, the tension-roll, and the apron, substantially as and for the purposes hereinbefore set forth.

3. The compound beater consisting of the rotating beater proper, H, with bars A, and the fixed or stationary blade W within the rotating beater proper, with its acting edge arranged with reference to the bars A, substantially as and for the purposes hereinbefore set forth.

4. The compound beater consisting of the rotating beater proper, H, with bars A, and the stationary blade W within the said beater proper, in combination with the guides, the breaker, and the tension devices, substantially as and for the purposes hereinbefore set forth.

388,665. MACHINE FOR TREATING HEMP, RAMIE, &c. JOSHUA J. GREEN, New York, N. Y. Filed May 28, 1888. Serial No. 274,778. (No model.)

Brief.—The stalk is split into two halves, each half passing between the feed-apron and a guide-plate to and about a breaker-bar, and between a pair of scraper-rolls revolving faster than the feed-apron travels. As the stalk passes about the breaker-bar the pith breaks and the end projects into the path of a compound beater consisting of two beaters, one within the other and revolving in opposite directions.

Claim.—1. The combination of the guide-plate, the feed-apron, the breaker bar or roll, the scraper-rolls, and the beater, substantially as and for the purposes hereinbefore set forth.

2. The combination of the guide-plate, the feed-apron, the breaker bar or roll, the beater, and the two sets of scraper-rolls S S' and S² S².

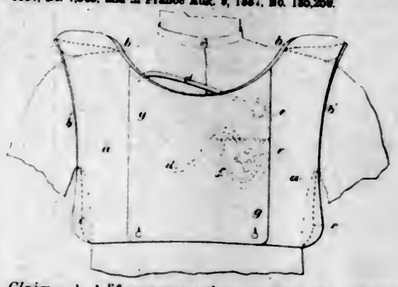
3. The combination of the feed-rolls, the splitting-knife, the feed-apron, the guide-plate, the breaker bar or roll, the scraper-rolls, and the beater, substantially as and for the purposes hereinbefore set forth.

4. The compound beater composed of the two beaters G H, the one within the other, rotating synchronously, but in opposite directions, substantially as and for the purposes hereinbefore set forth.

5. The compound beater composed of the two synchronously but oppositely-rotating beaters G H, the one within the other, in combination with the guide-plate, the feed-apron, the breaker bar or roll, and the scraper-rolls, substantially as and for the purposes hereinbefore set forth.

388,666. THERMOSTATIC VALVE FOR INCUBATORS. MILLER T. GREENLEAF, Quincy, Ill. Filed Nov. 22, 1887. Serial No. 255,869. (No model.)

Claim.—1. In an incubator, the combination, with a box or hatching-compartment having a ventilator-plate mounted upon a central axis having knife-edge bearings, of a thermostat composed of two metals of different expansibility curved into circular form, one end of said thermostat being rigidly mounted upon the top of the compartment and the free end bearing against the top of one of the knife-edge bearings, substantially as described.



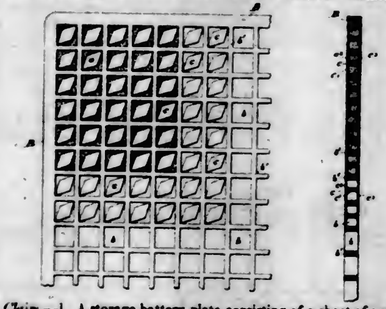
2. In an incubator, a ventilator-plate having central knife-edge

bearings, a thermostat composed of brass and steel or other metals having different indices of expansion bent into nearly circular form, an adjustable support, to which one end of said thermostat is rigidly fastened, and a set-screw for adjusting said support to bring its free end nearer to or farther from the knife-edge bearing, substantially as described.

3. A ventilator-plate having a bracket attached, provided with a strip of metal lying lengthwise of said plate and at right angles to its surface, and a ball straddling said strip and soldered thereto, substantially as described.

4. A ventilator-plate having a bracket consisting of a strip, 12, having oppositely-extending pieces 13 soldered on one surface of the ventilator-plate, and a ball, 14, straddling the strip and soldered thereto, substantially as described.

388,667. **LIFE PRESERVER OR BUOY.** Frederick Gresson, Springfield Place, Bradford, County of York, England. Filed Aug. 15, 1887. Serial No. 246,966. (No model.) Patented in England May 25, 1887, No. 7,585, and in France Aug. 9, 1887, No. 185,259.

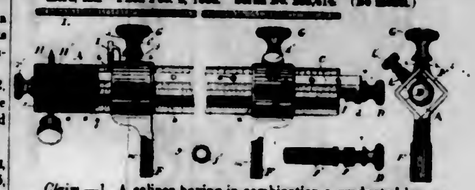


Claim.—1. A life preserver or buoy consisting of a continuous tubular-shaped bag, *a*, of water-proof material, provided with three apertures, *b b' b'*, for the neck and arms, respectively, and suitable inflating means, substantially as set forth.

2. A life preserver or buoy consisting of a continuous tubular-shaped bag, *a*, of water-proof material, provided with three apertures *b b' b'*, for the neck and arms, respectively, a longitudinal partition, *c*, extending entirely around the bag, whereby the bag is divided into two parallel air chambers or compartments, which extend around the front and back, and under and over the arm-apertures, and suitable means for inflating said compartments, substantially as shown and described.

3. A life preserver or buoy consisting of a continuous tubular-shaped bag, *a*, of water-proof material, provided with three apertures, *b b' b'*, for the neck and arms, respectively, a tube, *d*, provided with a tap-valve, *e*, a pocket, *f*, for supporting the tube and valve when not in use, and a turn-down flap, *g*, for covering and protecting the tube, substantially as and for the purpose set forth.

388,668. **STORAGE-BATTERY PLATE.** Charles D. P. Gibson, New York, N. Y. Filed Apr. 23, 1888. Serial No. 271,563. (No model.)

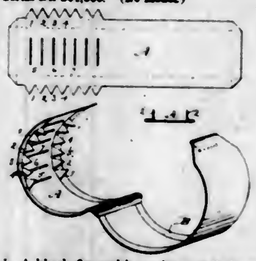


Claim.—1. A storage-battery plate consisting of a sheet of metal having transverse openings, a button of the same material extending through each opening and having an enlarged head at each end, and active material filling the spaces in the openings about the buttons.

2. A storage-battery plate consisting of a sheet of metal having openings, buttons placed in each opening, consisting of a central stem and enlarged heads, and active material placed in each opening about the said buttons.

3. A storage-battery plate consisting of a sheet of metal having rectangular openings, buttons of metal extending through each opening and consisting of central stems and flattened ends of diamond shape, said ends being approximately flush with the respective surfaces of the plate, and active material about the buttons.

388,669. **MICROMETER-CALIPER.** Edgar J. Hamlet, Baltimore, Md. Filed Feb. 2, 1888. Serial No. 262,414. (No model.)



Claim.—1. A caliper having in combination a graduated bar, an adjustable slide-bar extending lengthwise of the graduated bar and provided with pin-holes along its length, and slot c at one end, the screw *c'*, an initial caliper-point, a clip-head, F², surrounding the graduated bar and provided with the socket *b*, a thumb-pin to connect with the pin-holes in the slide-bar, and also provided with a caliper-point, and an adjusting-screw, D, for moving the said slide-bar endwise.

2. A caliper having in combination a graduated bar having in one end a bore, *o*, a clip-head surrounding the graduated bar and provided with thumb-screw for tightening it, and having a gage, I, a piston, *o'*, in the end bore, a spring, *g*, bearing against the piston, and a scratch-point, H, passing laterally through the graduated bar, and also through the said piston.

3. A caliper having in combination a graduated bar having in one end a bore, *o*, a clip-head surrounding the graduated bar and provided with thumb-screw for tightening it, and having a gage, I, a piston, *o'*, in the end bore, a tightening thumb-nut *r'*, to draw on the piston, and a scratch-point, H, passing laterally through the graduated bar, and also through the said piston.

388,670. **HORSE-TAIL TIE.** Charles D. Haldeman, Des Moines, Iowa, assignor of one-half to Clarence B. Jones, same place. Filed Jan. 23, 1888. Serial No. 261,869. (No model.)

Claim.—1. A blank for making a horse-tail tie, consisting of a metal plate having scallops on its edges and transverse parallel slots, substantially as shown and described, for the purpose stated.

2. A horse-tail tie consisting of a semicircular elastic metal band having series of teeth extending inward on its opposite sides at one end portion, and parallel slots extending across the band between the series of teeth, and a plain mating semicircular band hinged to the toothed band and provided with a hook on its free end adapted to engage the said slots in the toothed section, substantially as shown and described.

388,671. **STOCK-CAR.** Charles Hagen, Buffalo, N. Y., assignor of two-thirds to Henry Bunting and Leonard B. Crocker, both of same place. Filed Mar. 30, 1888. Serial No. 267,889. (No model.)

Claim.—1. The combination, with the walls of a stock-car provided with longitudinal slats A', separated by open spaces between each slat, of a series of movable slats, B, connected together and separated by open spaces between each slat, the slats B being adapted to fit into the open spaces between the slats A' and close said openings, screw-shanks *d*, secured to the movable slats and extending through

vertical slots *c*, formed in one of the stationary slats A', and clamping-nuts *f*, engaging with said screw-shanks, whereby the movable slats B are tightly clamped in rear of the stationary slats A', or into the spaces between the slats A', as desired, substantially as set forth.

2. The combination, with the car-walls composed of a series of longitudinal slats, A', separated by open spaces and having inner beveled edges, of a series of movable slats, B, connected together and having outer beveled edges and adapted to fit into the open spaces between the slats A', screw-shanks *d*, attached to the movable slats and passing through slots *c*, formed in the slats A', and clamping-nuts *f*, applied to said screw-shanks and bearing against the slats A', substantially as set forth.

388,672. **GRINDING-MACHINE.** Frank C. Hall, Philadelphia, Pa. Filed Feb. 21, 1888. Serial No. 264,741. (No model.)

Claim.—1. In combination with a grinding-wheel, a pivoted standard, and a spring connected thereto, an arm pivoted adjustably to the upper end of the standard, and a laterally-extending plate on the end of said arm, having lugs for holding the blade to be ground, all substantially as described.

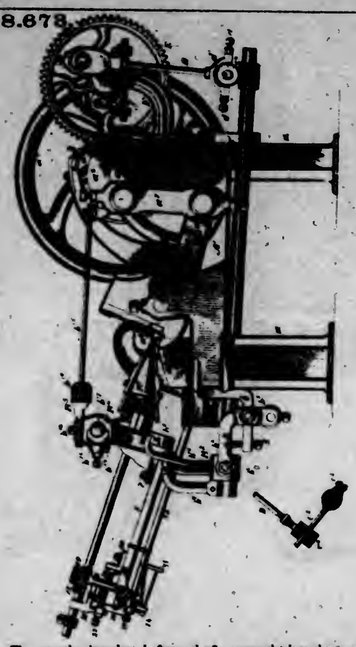
2. In combination with a grinding-wheel, a pivoted standard, and a spring engaging therewith, an arm, H, pivoted adjustably to the standard, and a laterally-extending plate on the end of the arm H, having inwardly-projecting spurs *l l*, projecting upwardly at a slight angle, all as described.

3. In combination with a grinding-wheel, an arm, as H, carrying a gage or blade-holder pivoted adjustably to an arm, F, said arm having studs, and a spring bearing on one of the studs, all substantially as described.

4. In combination with the grinding-wheel and the adjustably-pivoted arm, as H, the gage consisting of a plate, K, cut away on its upper edge, forming projections *n n* on either side, and having a spur, *m*, on its outer face, said spur and projections forming a notch for holding scissor-blades, substantially as described.

388,673. **NAIL-PLATE FEEDER.** George T. Harden and Benoni S. Grant, Middleport, Ohio; said Harden assignor to James S. Baggan, same place. Filed Mar. 5, 1887. Serial No. 229,772. (No model.)

Claim.—1. In a nail-plate feeder, the combination, with the adjustable rock-shaft C, of a transverse bar adjustably connected with the front end of the nail-machine, in connection with which the feeder is used, and a bearing for the front end of said shaft supported by said transverse bar and capable of adjusting itself to the angular direction of the shaft when the latter is adjusted, substantially as and for the purpose described.



2. In a nail-plate feeder, the combination, with the brackets by which the feeder is connected with the nail-machine and with the rock-shaft of the feeder, of a transverse bar or shaft, b^3, supported on said brackets by intermediate connections, and a bearing for the rock-shaft supported by said bar or shaft b^3 and capable of adjusting itself to a change in the angular direction of the rock-shaft, substantially as shown and described.

3. In a nail-plate feeder, the combination, with the brackets *b b*, the saddle B, and intermediate connections, of the transverse shaft b^3, pivotally mounted in the saddle, and the rock-shaft C, passing through said shaft b^3 and having a bearing therein, substantially as shown and described.

4. In a nail-plate feeder, the combination, with the brackets *b b*, the saddle carried thereby through intermediate connections, of the transverse shaft b^3, pivotally mounted in said saddle, and the barrel-stock mounted on said transverse shaft and capable of vibrating or swinging thereon, substantially as shown and described.

5. In a nail-plate feeder, the combination of the angular brackets *b b*, the bearing-blocks b^2, adjustably mounted on the horizontal arms of said brackets, the transverse rod b^3, carried by said bearing-blocks, the saddle B', mounted on the rod b^3 and capable of swinging thereon, the transverse shaft b^3, pivotally mounted between the horizontal arms of the saddle, and the barrel-stock mounted on said shaft and capable of swinging thereon, substantially as shown and described.

388,673.

6. The angular bracket *b*, formed of a wrought-iron bar and having the upper end of its vertical arm bent into hook shape and adapted to be attached to the bed of a nail-cutting machine by a bolt passing through its hooked end, substantially as shown and described.

7. In a nail-plate feeder, the combination, with the barrel and its stock, of a reciprocating rack working through the barrel-stock to impart oscillatory motion to the barrel, and a hinged guard arranged to cover the guideway of the rack and to protect the latter, substantially as shown and described.

8. In a nail-plate feeder, the combination, with the rock-shaft C, and with the reciprocating rack that oscillates the barrel, of the vibrating arm formed with a clamp-socket at its lower end for the reception of said shaft, the said socket being formed by bending the end of the arm around upon itself, whereby it is adapted to be adjustably clamped upon the shaft by a screw or bolt passing through the arm and through the bent end, substantially as and for the purpose described.

9. In a nail-plate feeder, the combination, with the wheel E, its shaft E' and crank E^2, and with the rock-shaft C, of the arms c^2, adjustably clamped upon the said shaft, the collar c^4 on said arm and capable of oscillating thereon, and the pitman D, connecting said collar with the crank E^2, substantially as and for the purpose described.

10. In a nail-plate feeder, the combination, with the rock-shaft C and its arm c^2, of the collar c^4 on said arm, the forked pitman D d', connected with said collar by pointed screws *d d*, passing through the arms of its fork, and the crank E^2 on the shaft of wheel E, with which the pitman is connected at its opposite end, substantially as shown and described.

11. The feeding-fork for nail-plate feeders herein shown and described, consisting of two main parts, 9 10, each having horizontal arms by which they are pivoted or hinged together, and grasping-jaws at their upper ends, in combination with an arm projecting from the barrel-stock, to which arm one of said parts is hinged, to swing or vibrate forward and backward, substantially as shown and described.

12. The feeding-fork herein shown and described, consisting of the two parts 9 10, each having horizontal arms by which they are pivoted or hinged together, and grasping-jaws at their upper ends, one of said jaws being spring-seated, substantially as shown and described.

13. The combination, in a nail-plate feeder, of the bar 8, projecting from the barrel-stock, the part 9 of the feeding-fork hinged to said arm to swing forward and backward, the part 10 hinged to the part 9 to swing toward and from the same, the said parts 9 10 being provided with jaws to grasp the nipper-rod, a spring to throw the connected parts 9 10 forward, and a push-bar, 34, between the nail-machine and a horizontal arm that projects below the connection between

the arm 8 and the part 9, whereby, when the barrel-stock moves toward the machine, the jaws will first be closed to grasp the nipper-rod and then moved toward the machine, substantially as shown and described.

14. In a nail-plate feeder, the combination of two grasping-jaws hinged together and adapted to open and close by a swinging movement in a horizontal plane and capable of vibrating in a vertical plane, and a push-rod operating upon the arm of one jaw, for imparting motion to said jaws in both directions, substantially as and for the purpose described.

15. The combination, with the barrel of a nail-plate feeder, of the holding-bars *p p* and the plates *q q*, to which they are attached, the said plates being pivotally connected to the barrel by screws *u u*, substantially as shown and described.

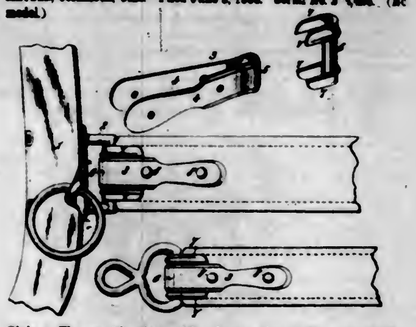
16. The combination, with the barrel of a nail-plate feeder, of the holding-bars *p p* and the plates *q q*, to which they are secured, the said plates being pivotally connected to the barrel by spherical-headed screws *u u*, and springs *v v*, to press the points of said holding-bars together, substantially as shown and described.

388,674. **BOOK-SUPPORT FOR SHELVES.** Mark W. Harrington, Ann Arbor, Mich. Filed Mar. 30, 1888. Serial No. 269,009. (No model.)

Claim.—1. A book-support for shelves, comprising in combination a body portion to support a book placed against it, a foot on said body portion adapted to press upon the upper surface of the shelf in use, an arm projecting from the body portion below said foot to permit the entrance of the edge of the shelf, and said body portion being arched or extended upwardly in front of said foot and above said arm, whereby the support may rock forward and is made self-clamping upon the shelf, substantially as described.

2. A book-support for shelves, comprising in combination a body portion to support a book placed against it, a foot on said body portion adapted to press upon the upper surface of the shelf in use, an arm projecting from the body portion below said foot to permit the entrance of the edge of the shelf and beyond said foot, whereby the center of gravity is in front of the center of rotation, and said body portion being arched or extended upwardly in front of said foot and above said arm, whereby the support may rock forward and is made self-clamping upon the shelf, substantially as and for the purpose set forth.

388,675. **WAGON-BODY.** Richard C. Hart, Quincy, Mo. Filed Feb. 2, 1888. Serial No. 262,719. (No model.)



Claim.—1. The wagon-body brace consisting of the brace having the thickened lower end portion, having a web tapering from the upper end of said thickened portion upward, said brace also having a series of steps arranged at intervals throughout its length, substantially as set forth.

2. The combination, with a wagon-body bottom, of the angle-plate forming the bottom of a socket in said bottom, and the brace applied to the side of the body and resting in said socket upon said angle-plate, said angle-plate projecting beyond said bottom, adapting it to rest upon the bolster, substantially as set forth.

3. The combination, with the wagon-body bottom, of the angle-plate forming the bottom of a socket in said bottom and offset from the side edge and under side thereof, substantially as set forth.

4. The combination, with the wagon-body bottom having a socket, of the angle-plate forming the bottom of said socket and projecting or offset from the under side and side edges of said bottom, the brace having its lower end let into said socket and provided with steps and a web, and the side having recesses or sockets which receive said steps and web, said side having a wearing-plate opposite the bolster-standard, substantially as specified.

388,676. **WEAR-PLATE FOR HARNESS-HOOKS.** William B. Hayden, Columbus, Ohio. Filed June 6, 1888. Serial No. 276,026. (No model.)

Claim.—The combination, with a harness-iron, of a wear-saddle, 6, having clip-plates 7, a clip, 3, the loop of which rests directly upon said saddle, and a strap embraced by said clip and by the ends of the clip-plates, substantially as described.

388,677. **MEASURING-VESSEL.** George Hayn, New York, N. Y. Filed Mar. 1, 1888. Serial No. 266,573. (No model.)

Claim.—1. A bottle provided with graduating lines or marks indicating measure, radiating from a point, essentially as shown and described.

2. A liquid-receptacle, of glass, having upon its outer surface designating-lines radiating from a common center or index-point, adapted to indicate the amount of liquid taken and being taken from the vessel, essentially as shown and described.

3. A liquid-receptacle, of glass, having to its outer surface a set of radial lines with a common center, the lines diverging and located at such angles as to indicate the amount of contents being poured out, or as poured out, by coinciding with the level of the contents of the vessel when it is inclined in the act of pouring, essentially as shown and described.

4. A vessel or liquid-holder having to its face a set of radiating lines so arranged that the level of liquid therein may be brought to coincide with line after line of the set in the act of pouring as the vessel is tilted, the several lines of the set diverging and graduated to indicate measurement of quantity through coincidence of line and level of liquid, essentially as shown and described.

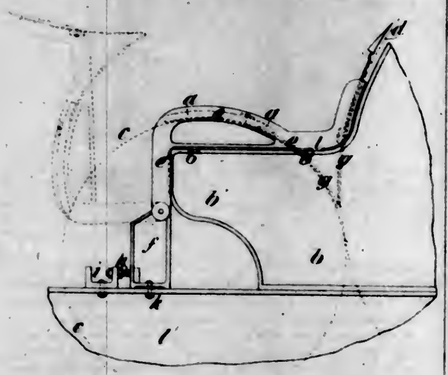
5. A liquid-receptacle funnel-shaped at the junction of body and neck, and provided with the radial lines B, for measurement, essentially as shown and described.

6. A liquid-receptacle, A, having its neck formed with the lateral grooves C, and upon its outer surface the radial lines B, essentially as shown and described.

7. A liquid-receptacle provided with graduating lines or marks indicating measure, radiating from a common center, and also lines or marks indicating measure, arranged horizontally, whereby quantities may be measured in the act of pouring and amount of contents noted when the vessel is at rest, essentially as shown and described.

8. A liquid-receptacle provided with radial lines or converging lines or marks indicating measure as the vessel is tilted or inclined, and also parallel lines or marks indicating measure when the vessel is perpendicular, essentially as shown and described.

388,678. **ART OR METHOD OF KNITTING STOCKINGS.** Samuel Hemmall, Philadelphia, Pa. Filed Oct. 27, 1887. Serial No. 253,512. (No model.)



Claim.—The mode herein described of forming a toe upon a stocking, said mode consisting in forming upon the foot opposite projecting tapering tongues by narrowing the web first upon the needles of one

388,678.

half of the machine and then upon the needles of the other half, then forming stitches around the entire set of needles, and then uniting the adjacent edges of the continuous band thus produced, all substantially as specified.

388,679. **CARDING-ENGINE.** John M. Rutherford, Manchester, County of Lancaster, England. Filed Jan. 4, 1888. Serial No. 259,791. (No model.) Patented in England July 24, 1884, No. 10,518.

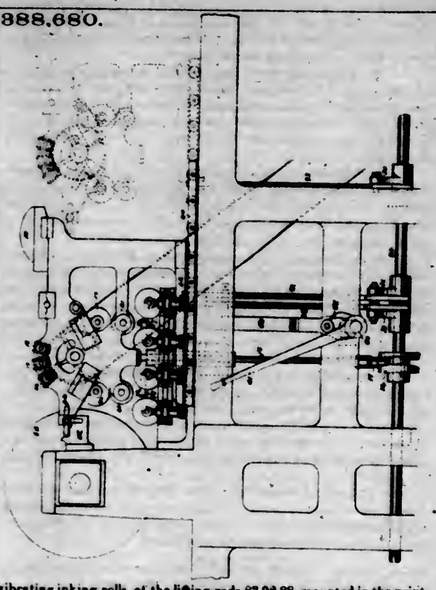
Claim.—1. In a carding-engine, the combination of the main and doffer cylinders, under framing, and side frames having flat or level surfaces, with the doffer-cover resting upon said flat or level surfaces, standards or blocks to which the doffer-cover is hinged, and means for adjusting the said standards upon the framing, substantially as set forth.

2. In a carding-engine, the combination of the main and doffer cylinders, side frames, and under framing, with the doffer-cover and parts to which said cover is hinged in front of the main axis of the doffer, so that when the cover is lifted all parts move clear from the doffer, substantially as described.

3. In a carding-engine, the combination of the main and doffer cylinders, under framing, the side frames having horizontal surfaces, in combination with the doffer-cover, making-up pieces, and side pieces resting upon the said horizontal surfaces, standards to which the said side pieces are hinged, and means for adjusting the standards, substantially as described.

388,680. **INKING APPARATUS FOR PRINTING-MACHINES.** Richard M. Hoe, New York, (Mary S. Hoe executrix of said Richard M. Hoe, deceased,) and Dominick Wesselius, Brooklyn, assignors, by direct and mesne assignments, to Robert Hoe, Peter S. Hoe, Stephen D. Tucker, and Theodore H. Mead, New York, N. Y. Filed Nov. 28, 1882. Serial No. 77,679. (No model.)

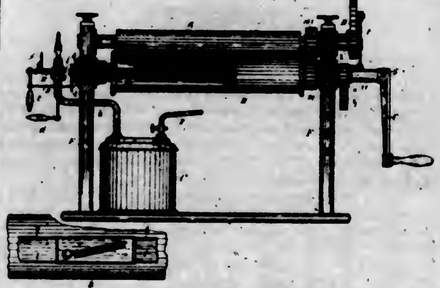
Claim.—1. The combination, with the main frame of the printing-machine, of the ink-distributing apparatus and its vertically-movable horizontally-sliding supporting-carriage, substantially as described.



2. The combination, with the ink-distributing apparatus and its movable supporting-carriage, of the independent roller-frames 40, substantially as described.

3. The combination, with the ink-distributing apparatus, its movable supporting-carriage, and its elevating mechanism, of the independent roller-frames 40, substantially as described.

4. The combination, with the main frame of the printing-machine, of the ink-distributing apparatus, its vertically-movable horizontally-sliding supporting-carriage, and clamping devices, substantially as described, for rigidly supporting said ink-distributing apparatus and its carriage in its adjusted position during the printing operation.



5. The combination, with the movable ink-distributing apparatus, carriage, and the devices supported by said carriage for actuating the

388,680.

vibrating inking-rolls, of the lifting-rods 83 92 88, mounted in the printing-machine frame, substantially as described.

388,681. **PHOTOGRAPHIC BURNISHING-MACHINE.** Alfred H. Humphrey, Meadon, Mich. Filed Jan. 30, 1888. Serial No. 262,257. (No model.)

Claim.—1. The combination of the revoluble cylinders, gear-connected, one provided with a pinion, the other with a connected pinion and crank revoluble on its axle, a gear with which the crank-pinion meshes, a segmental gear meshing with one of the cylinder-pinions, and a connecting-rod between the segmental gear and the gear which meshes with the crank-pinion, whereby the cylinders rotate first one way and then the other while the crank is turned in one direction, substantially as set forth.

2. The combination of the gear-connected cylinders, one having a detachable pinion, the other having a connected crank and pinion rigidly attached to its axis by a set-screw, a gear meshing with the crank-pinion, a segmental gear meshing with the detachable pinion, and a connecting-rod between the segmental gear and the gear which meshes with the crank-pinion, substantially as set forth.

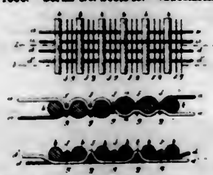
3. A gas or vapor burner for heating purposes comprising two concentric tubes, revoluble one in the other, and each provided with lines of perforations adapted to register with each other, in combination with the feed and burnishing cylinders, substantially as set forth.

4. A gas or vapor burner for heating purposes comprising the concentric tubes, one of which is adapted to rotate, and each provided with the lines of perforations, and one having the slots in its said line of perforations, in combination with the feed and burnishing cylinders substantially as set forth.

5. A gas or vapor burner comprising the concentric tubes adapted to be rotated one within the other, or vice versa, each having the lines of perforations, and the inner one having the slots, and provided with

a lever, a stop to limit the play or throw of said lever, and a supporting-frame, all combined with the cylinders between which the photograph passes, substantially as set forth.

6. In combination, the revoluble hollow cylinders between which the photograph is to be passed, means for rotating said cylinders, the concentric tubes in the burnishing-cylinder, each having the line of perforations, and one revoluble in the other, and provided with a lever to rotate it and a stop to limit the throw of said lever, substantially as set forth.



7. In combination, two revoluble hollow cylinders, means to rotate them, the concentric tubes having the spiral lines of perforations, the inner one provided with the slots in the line of its perforations, said tubes being in the burnishing-cylinder, and means to supply gas or vapor within the inner tube, substantially as set forth.

8. In combination, the revoluble hollow cylinders, the concentric tubes in the burnishing-cylinder having the spiral lines of perforations registering with each other, the inner tube revoluble in the latter and provided with a lever to rotate it by, a vapor-generator, the handle of which operates the spindle to control the flow of vapor, having an arm adapted to contact with the lever of the inner tube, and the supporting standards or frame, substantially as set forth.

9. In combination, the hollow cylinders between which the photograph is passed, the tubes therein having the lines of perforations, one revoluble within the other, the revoluble one having a lever, a vapor-generator having an indicator denoting the throw of the lever which controls the flow of vapor, and an arm attached to said lever and adapted to contact the lever of the revoluble tube, substantially as set forth.

10. The combination of two hollow cylinders between which the photograph is passed, a tube in one of said cylinders having the line of perforations, and a gas or vapor apparatus for blowing the gas or vapor into said tube, substantially as set forth.

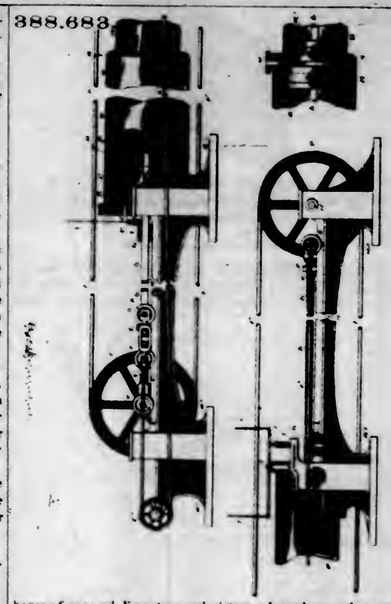
388,682. **CARPET FABRIC.** John Humphries, Philadelphia, Pa. Filed Feb. 27, 1888. Serial No. 265,349. (Specimens.)

Claim.—1. The within-described carpet fabric, in which each set of warp-threads comprises figuring-warps and binding-warps, and each set of weft-threads comprises a filling or stuffer thread and two binding-threads, one of said binding-threads confining the figuring-warp of the face only and the other confining the figuring-warp of the back only, all substantially as specified.

2. The within-described carpet fabric, in which each set of warp-threads comprises figuring-threads and binders, and each set of weft-threads comprises a filling or stuffer thread, a fine thread confining the figuring-warps of the face, and a thick thread confining and covering the figuring-threads on the back of the fabric, all substantially as specified.

388,683. **HYDRAULIC ELEVATOR.** Edwin Hunt, Cleveland, Ohio. Filed Aug. 26, 1887. Serial No. 247,920. (No model.)

Claim.—1. In a hydraulic elevator, the combination, with a water-cylinder having communicating bores of unequal diameter and pistons adapted to reciprocate in said bores to hoist or assist in hoisting the load, of blocking mechanism for holding one or both pistons stationary, substantially as set forth.



2. In a hydraulic elevator, the combination, with a water-cylinder having communicating bores of unequal diameters and pistons adapted to reciprocate in said cylinder, of a piston-rod extending from each piston, a flexible cable connecting said rods, and wedge or wedges for holding one or both pistons stationary, substantially as set forth.

3. The combination, with water-cylinder having bores of unequal area and piston of unequal area operating in opposite directions in the bores of said cylinder, with suitable mechanism, substantially as indicated, for transmitting and utilizing the power of the pistons in elevating the load, of wedges for blocking the respective pistons, and suitable levers and cables for operating the wedges from the cage of the elevator, substantially as set forth.

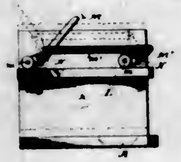
4. The combination, with water-cylinder and piston, substantially as indicated, of openings through the pistons and valves for closing such openings, said valves opening inward, valve-stems projecting outward beyond the face of the pistons, and stops for engaging such valve-stems to open the valves whenever the pistons shall have exceeded their normal outward movement, substantially as set forth.

5. The combination, with a water-cylinder having communicating

388,683.

bores of unequal diameters and pistons adapted to reciprocate in the bores of said cylinder, of a piston-rod extending from each piston and a cable connecting the piston-rods, substantially as set forth.

6. The combination, with a water-cylinder composed of two communicating bores of unequal diameter, and pistons adapted to reciprocate in the bores of said cylinder, of piston-rods extending from each piston, yokes secured to said piston-rods, and cables connecting said yokes, substantially as set forth.



7. The combination, with a water-cylinder composed of a large and small communicating chamber, and having a water-inlet entering these chambers between the pistons and pistons of different areas in the cylinder, of piston-rods, yokes secured to said rods, and cables connecting said yokes, substantially as set forth.

8. The combination, with a frame having ways thereon, a water-cylinder supported by said frame, said cylinder being composed of a large and small chamber, pistons of different areas in said chambers, and piston-rods extending from the pistons, of a set of reciprocating sheaves connected with one piston, a reciprocating yoke connected with the other, a cable connecting the piston-rods, a set of stationary sheaves, and a cable string over the stationary and reciprocating sheaves, substantially as set forth.

388,684. **CORN-HARVESTER.** Preston R. Hunt, Plattsville, assignor of one-half to Albert J. Cory, Tawawa, Ohio. Filed Mar. 10, 1888. Serial No. 266,847. (No model.)

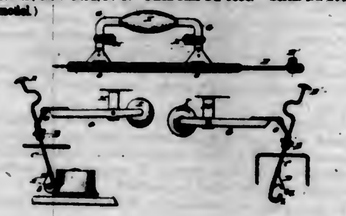
Claim.—1. In a wheeled corn-harvester, the combination, with a circular cutter mounted horizontally in the front side of the main frame and mechanism for operating the cutter, of a receptacle for cut stalks in rear of the cutter, two sets of belts in front of the receptacle, one on each side, the belts of each set traveling in the same plane, one vertically over the other, for directing the stalks to the cutter and thence to the receptacle, two wheels having radiating arms arranged in the same horizontal plane, one at each side of the receptacle, between the two belts composing each set, for directing the stalks to the belts, and mechanism, substantially as described, for operating the belts and feed-wheels.

2. In a wheeled corn-harvester, the combination, with the frame having a floor formed of transverse slats, as described, of a swinging rack having bottom slats adapted to fit between the slats of the floor,

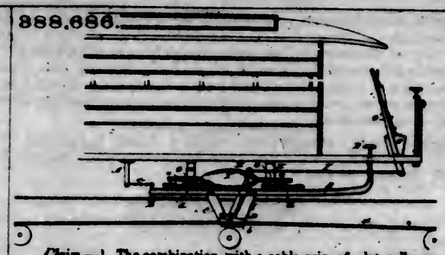
388,684.

a wheel-guard to which the rack is pivoted, cam-levers pivoted to one side of the rack coupled together by a bar and provided with friction-rolls at their lower ends and a fixed segmental track mounted on the main frame at one side of the machine, upon which said friction-rolls travel, for the purpose stated.

388,685. **SHOE-REST.** Charles W. Hutchinson and Edwin A. Tracy, Berwick, Conn., assignors to William A. Allen, same place. Filed June 27, 1888. Serial No. 278,246. (No model.)



Claim.—1. A shoe-support consisting of two overlapping plates having coincident slots to provide adjustment relative to each other and upturned ends to clasp the shoe, as set forth, in combination with a stand having a threaded end extending through said slots, a binding-nut on said threaded end for interlocking said plates and stud, and a socketed stand for supporting the described shoe-support, all substantially as and for the purpose specified.

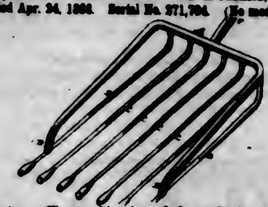


2. A shoe-support formed of two metallic plates having upturned ends to clasp a shoe-sole and coincident slots, whereby adjustment relative to each other may be attained, a threaded supporting-stud projecting through said slots, and a binding-nut on said threaded stud having one side formed as a rib somewhat less in width than said slots, substantially as and for the purpose specified.

3. In combination with bar *d*, a collar fitted adjustably on said bar, a clamping-screw, *f*, a stud with milled head seated in said collar, a shoe-support formed of two overlapping slotted plates with upturned ends, as set forth, and a nut on said stud for clamping together the plates of said shoe-support, all substantially as and for the purpose specified.

388,686. **CABLE-GRIP FOR TRACTION RAILWAYS.** Orlando H. Jaquith, New York, N. Y. Filed Jan. 24, 1888. Serial No. 261,772. (No model.)

388,686.



Claim.—1. The combination, with a cable-grip, of a laterally-projecting counter-balance arranged to work in a plane at right angles to the cable, substantially as and for the purpose described.

2. The combination, with a cable-grip, of a laterally-projecting counter-balance arranged to work in a plane at right angles to the cable, and links or double hinges connecting the counter-balance and grip and having their axes parallel with the cable, substantially as and for the purpose described.

3. The combination, with a cable-grip, of a laterally-projecting counter-balance arranged to play at right angles to the cable and a sliding connection between the two arranged to yield in the direction of the draft, substantially as and for the purpose described.

4. The combination, with a grip hung upon an axis parallel with the cable, of a rigidly-attached bar extended above the platform and provided with a treadle-head, substantially as and for the purpose described.

388,687. **CORN-SCOOP.** John A. Jessmon, Union County, Miss. Filed Apr. 24, 1888. Serial No. 271,704. (No model.)

Claim.—The combination of the body A, made heaviest at its center and lightest at its front ends, and having its front ends, D, curved downward and secured to the two outer tines, with the tines C, provided with the balls G upon their outer ends, and which have their rear ends curved upward and secured to the central portion of the body, and the handle F, substantially as shown.

388,688. **SWITCH FOR TRACKS FOR CARRYING IRON.** Erwin A. Kerr, Girard, Ohio. Filed May 14, 1888. Serial No. 273,886. (No model.)

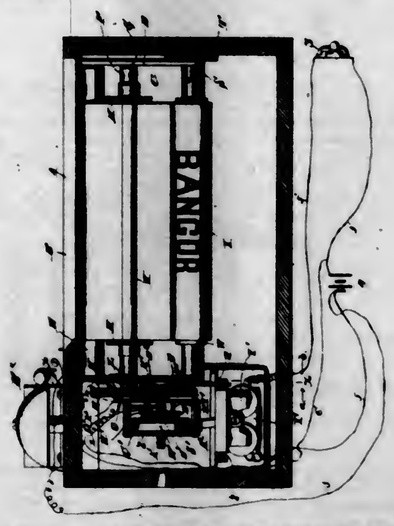
Claim.—1. The combination, with the main track A, and side track, B, of the switch C, which is pivoted at a point higher than the said main track, and beveled at its free end, and provided with ears *c c*, whereby it is adapted to be lowered, so as to rest upon the main track, and to be held in place thereon when in use, as shown and described.

2. The combination, with the main track A and the slotted support E, of the switch C, pivoted to the support E, and provided with the horizontally-projecting pin *c'*, and lever-connections for throwing said switch into and out of register with the main track, as herein shown and described.

3. The combination, with the main track A, secured to the support E, having the vertical slot *e*, of the side track, B, provided with the vertically-tilting switch C, having the horizontally-projecting pin *c'*, the lever D, pivoted to the support E, and connected at one end to the vertically-tilting switch C by the rod *d*, and provided at its other end with the adjustable weight W, whereby said vertically-tilting

switch is held in a raised position above the main track, as shown and described.

4. The combination, with the vertically-tilting switch C, having its free end beveled, of the rod *d'*, weighted lever D, rod *d*, lever F, and cord or chain G, whereby the said vertically-tilting switch is thrown into and out of register with the main track, substantially as shown and described.

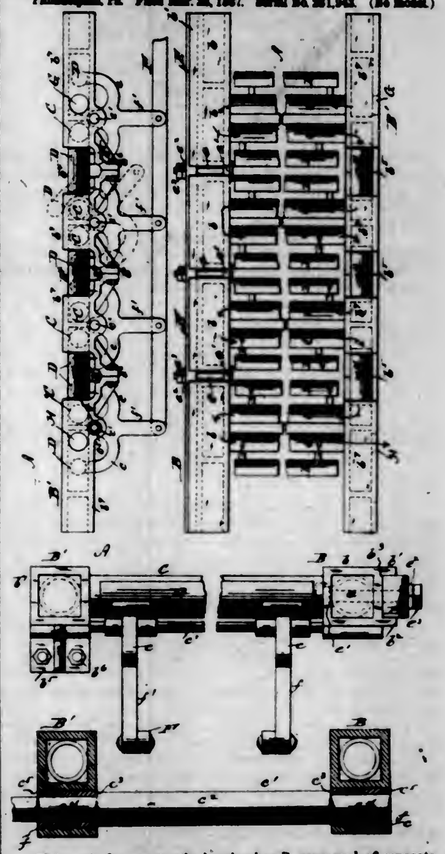


388,689. CARRIAGE-TOP. Salem R. Kimball, Jackson, Penn., assignor of one-half to Francis Asbury Williams, same place. Filed Jan. 16, 1888. Serial No. 261,147. (No model.)

Claim.—1. In a carriage-top, the combination, with the front bow restricted to the canopy or cover, and the middle bow, of the additional braces connected to said front and middle bows, and, in addition, to yielding or flexing inward, each having an offset near its lower end and inwardly curved above its flexing or yielding point or joint, permitting the braces, as the top folds down, to rest upon the middle bow and sustain the top in the lowered position, substantially as set forth.

2. In a carriage-top, the combination, with the front bow restricted to the canopy or cover, and the middle bow, of the additional braces connected to said front and middle bows, and each being formed with a spring and an offset near its lower end and inwardly curved above said spring, substantially as set forth.

388,690. ELECTRIC RAILWAY-STATION INDICATOR. Gideon H. Kirwan, Wilkes-Barré, Pa. Filed Mar. 27, 1888. Serial No. 268,700. (No model.)



Claim.—1. The combination of the station-indicator, the motor to operate the same, and provided with the switch-wheel and arm or contact, the armature having the arm to engage and disengage the motor, for the purpose set forth, the electro-magnet to operate the armature, the battery, the circuit-closer, the bell, and the open circuits connecting the electro-magnet to the circuit-closer and the battery and connecting the bell, the switch, and the battery, substantially as described.

2. The combination, in a station-indicator, of the shaft F, the wheel M, loose thereon, the motor having the operating-wheel engaging wheel M, the clutch to connect the said wheel to the said shaft, the lever to operate said clutch, the shaft W, the spring U, connected thereto, and the scroll or apron rolled on the shaft W and connected to the shaft F, whereby when the latter is rotated the scroll will be unrolled from the shaft W onto the shaft F and the spring will be wound, substantially as described.

3. The combination of the spindle S, the spring U, attached thereto, the shaft W, having one end journaled in a suitable bearing and detachable therefrom, the opposite end of said shaft being secured to the spindle, the operating-shaft F, the scroll normally rolled on the shaft W, and having its free end detachably connected to shaft F, the wheel M, loose on shaft F, the clutch to secure said wheel thereto, and the motor having the wheel engaging said wheel M, substantially as described.

4. The combination of the station-indicator, the motor to operate the same, provided with the switch-wheel and with the revolving cam L', having the notch M', the annunciator connected in open circuit with the switch-wheel and with a battery, the armature having the arm provided with the stop to engage the notch in the cam, and the electro-magnet to operate the said armature, said electro-magnet being connected in open circuit with the battery and with a circuit-closer, substantially as described.

388,691. GRATE-BAR. Gideon L. Kinney and James Reagan, Philadelphia, Pa. Filed Mar. 22, 1887. Serial No. 231,943. (No model.)

Claim.—1. In a grate, the bearing-bar B, composed of separate sections connected together so as to permit of independent expansion and contraction of the same, grate-bars C, connecting the sections of bar B to another bearing-bar, B', rocking or shaking bars D, having their shafts mounted in bearings secured to the bearing-bars B and B', and actuating mechanism for the rocking bars D, substantially as set forth.

2. A grate composed of hollow supporting or bearing bars B B', composed of separate sections, hollow grate-bars C, connecting the sections of bars B B', rocking or shaker bars D, having shaft-bearings in boxes secured to bearing-bars B B', and actuating mechanism for said shaker-bars, substantially as set forth.

3. In a grate, the combination of bearing-bar B, composed of separate hollow sections frictionally secured to a bar, E, to admit of independent expansion and contraction of said sections, bearing-bar B', composed of separate hollow sections having pipe-couplings *b'* and flanges and bolt-connections *b' b'*, hollow grate-bars C C, connecting the sections of bars B B', shaker-bars D D, having shaft-bearings in boxes secured to the sections of bars B B', and actuating mechanism for said shaker-bars, substantially as set forth.

4. In a grate, the combination of bearing-bars B B', one of which is composed of sections, each section having a flange and a bolt-connection with a supporting-bar, grate-bars connecting the sections, rocking arms or shakers for the grate-bars, and actuating mechanism for the shaker-arms, substantially as and for the purpose set forth.

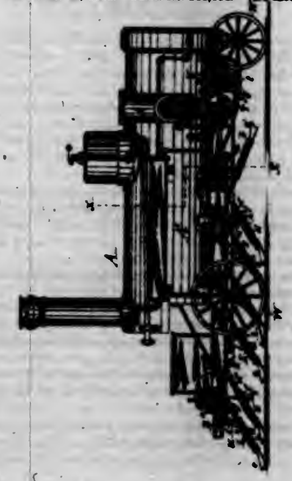
5. In a grate, the combination, with bearing-bars B B' and parallel grate-bars C C, grouped in pairs, of separate rocking or shaking bars D D, grouped in pairs, each pair mounted upon a common shaft with a pair of grate-bars between them and adapted to move in reverse directions to provide open spaces between the pairs of grate-bars, and actuating mechanism for bars D D, substantially as set forth.

6. In a grate, the combination of bearing-bars B B', grate-bars C C, separate rocking or shaker bars D D, arranged in pairs, and each pair mounted upon a common shaft having bearings in boxes secured to bars B B', and actuating mechanism for shaker-bars D D, substantially as set forth.

7. The sectional water-bars B B', combined with connecting tubular bars C, rocking bars D, having shafts mounted on bars B B', and actuating mechanism for bars D D, substantially as set forth.

8. In a water-grate, the combination of bar B, composed of hollow sections connected to a supporting-bar, E, grate-bars C, bar B', composed of sections having pipe-couplings *b'*, and flange-bolted connections, rocking bars D, and actuating mechanism for bars D, substantially as set forth.

9. In a grate, the combination of a bearing-bar, B, composed of sections having edge flanges, *b' b'*, a bar, E, adapted to said flanges, and bolt-connections *c*, passing between said sections and engaging at one end with the sections and at the other with bar E, substantially as and for the purpose set forth.



10. In a grate, the combination of a bearing-bar, B, composed of separate sections, a rod, E, upon which said sections are strung or supported, and bolt-connections engaging at one end with the sections and at the other with said bar E to divide or space the sections from one another and secure them to said bar, substantially as set forth.

11. In a grate, the combination of bearing-bars B B', having openings *f*, thimbles *e'* in said openings, angular shafts C, having round journals adapted to said thimbles, rocking bars secured to said shafts, and actuating mechanism for the latter, substantially as set forth.

12. A grate composed of two parts, each part having sectional bearing-bars B B', grate-bars having shaft-bearings in boxes secured to bars B B', connecting-bars B B', rocking bars, and separate shaking devices for the rocking bars of each part of the grate, substantially as set forth.

13. A grate composed of sectional bearing water-bars B B', tubular grate-bars, inlet and outlet pipe-connections, and a drain or drip pipe with cock leading from the said outlet-pipe, substantially as set forth.

388,692. TRACTION-ENGINE. Edward M. Kimlin, Lacona, N. Y. Filed Mar. 22, 1888. Serial No. 268,004. (No model.)

Claim.—1. The combination, with an engine mounted on wheels, of longitudinally-reciprocating bars actuated by said engine and propelling-legs connected to said bars, as and for the purpose specified.

2. The combination, with an engine mounted on wheels, of longitudinally-reciprocating bars actuated by said engine and propelling-legs hinged to said bars, substantially as described and shown.

3. The combination, with an engine mounted on wheels, of bars connected movably longitudinally to the supporting-frame of the engine, a driving-shaft arranged transversely on the engine, eccentrics on said driving-shaft, pitmen connecting said eccentrics with the longitudinally-movable bars, and propelling-legs hinged to said bars, substantially as described and shown.

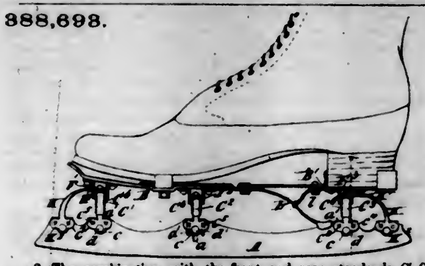
4. The combination, with the engine mounted on wheels, of the bars B B, arranged lengthwise the engine and movable longitudinally, the driving-shaft C, arranged crosswise of the engine, the clutch-faces D D, rigidly attached to said driving-shaft, sleeves E E, mounted loosely on said shaft at opposite sides of the clutch-faces, clutches F F, adapted to slide longitudinally on said sleeves and locked circumferentially thereon, eccentrics *a a*, rigidly secured to the sleeves, and pitmen *b b*, connecting said eccentrics with the bars B B, and propelling-legs L L, connected to said bars, substantially as described and shown.

5. In combination with the engine mounted on wheels and reciprocating bars arranged lengthwise of the engine and actuated thereby, propelling-legs hinged to said bars, and cables or chains having branches connected, respectively, with the successive propelling-legs for lifting the same simultaneously out of their operative position, as set forth.

6. In combination with the engine mounted on wheels, and reciprocating bars arranged lengthwise of the engine and actuated thereby, propelling-legs pivoted to said bars, windlasses pivoted to the frame of the engine, and cables or chains wound at one end on said windlasses, and having the opposite end portions provided with branches connected with the successive propelling-legs, substantially as described and shown.

7. A traction-engine comprising a driving-shaft separate and distinct from the axles of the carrying-wheels, power-transmitting devices mounted independent of each other on said shaft, and adapted to be thrown in and out of gear therewith and transmit either propelling motion to the carriage of the engine or power to machines remote from the engine, a windlass mounted on the carriage of the engine and adapted to be thrown in and out of gear with the aforesaid shaft, and a cable or chain extended from said windlass, substantially as specified.

8. On a traction-engine of the class herein specified, the combination, with the driving-shaft C, separate and distinct from the axles of the carrying-wheels, and power-transmitting device on said shaft adapted to be thrown into and out of gear therewith, and to either propel the carriage of the engine or transmit motion to machines remote from the engine, of the worm H on the said driving-shaft, the gear-wheel I, adapted to be thrown into and out of gear with the worm, the drum or windlass J, turning with the said gear-wheel, and a cable or chain wound at one end on the said drum, substantially as and for the purpose set forth.



9. The combination, with the engine mounted on wheels, of the driving-shaft C, worm H, rigid on said shaft, the shaft *g*, arranged adjustably toward and from the said worm, the gear-wheel I, and drum J, journaled on the shaft *g*, a cable or chain wound at one end on said drum, and braces adapted to sustain the engine in its position, as set forth.

10. The combination, with the engine mounted on wheels, of the driving-shaft C, worm H, and clutch-faces D D, rigidly attached to said shaft, the sleeves E E, mounted loosely on said shaft and provided with splines *h*, the clutches F F, sliding on said splines, eccentrics *a a*, secured to the sleeves E E, the bars B B, arranged movably longitudinally, pitmen *b b*, connecting the eccentrics with the said bars, propelling-legs L L, connected to the bars B B, the gear-wheel I, adapted to be thrown in and out of gear with the aforesaid worm, the drum J, turning with the gear-wheel I, and the cable or chain *i*, wound on said drum, all combined substantially as described and shown, for the purpose set forth.

388,693. SKATE. Joseph A. La Chapelle, St. Martin, Quebec, Canada. Filed Jan. 24, 1888. Serial No. 261,722. (No model.)

Claim.—1. In a skate, the combination, with the blade and foot-plates, of standards set on and secured to the blade and fork-shaped, so as to extend outward and upward on each side of same, vertical pins carried between sides of and on cross-piece of standard, a single spring coiled alternately around each of such pins, boxes projecting downward and secured on the under side of the foot-plates and perforated to fit over such pins and resting on said springs, and a connecting-bar passing through such projecting boxes and secured to the tops of the sides of the standards, all as shown and described, and for the purpose set forth.

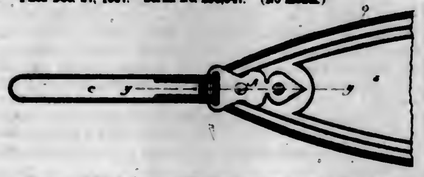
388,693.

2. The combination, with the front and rear standards, C C², rigidly secured to the blade A and carrying pins D, mounted on them, and springs E, wound around said pins alternately, of curved forked stays K, secured to the ends C² C² of the standards and to the blade A, as and for the purposes set forth.

3. The combination, with the blade A and standards C C², and stays K K, with flattened ends *c* K², riveted to such blade, of dogs or projections formed on inner side of such flattened ends, and vertical grooves *d'* in blade, in which such dogs fit, as and for the purposes set forth.

4. The combination, with the blade and foot-plates of a skate, and, in combination, the standards C C², secured rigidly to the blade, with stays K K, to prevent longitudinal movement, of the standard C², carrying pins D D and spring E, and secured to blade so as to allow of vertical movement, as shown.

388,694. CONSTRUCTION OF PAVEMENTS. Israel L. Landis, Lancaster, Pa. Filed July 16, 1888. Serial No. 280,087. (No model.)



Claim.—1. The combination, with the binding-plates of a street-pavement, of the inwardly-extending links and a connecting tie-link whereby the parts may be forcibly drawn together and locked, substantially as specified.

2. The combination, with the binding-plates, of the tie-link perforated, as described, and provided with an eye through which a stake may be driven to secure the parts together, substantially as specified.

3. The combination, with the binding-plates and the connected links D, of the clutch-links engaging the said plates and connected with the said links D, substantially as and for the purposes set forth.

4. The combination, with the binding-plates, of the sleeves covering the joints between the same and the connecting-links secured to said sleeve and connected with each other by tie-links, substantially as specified.

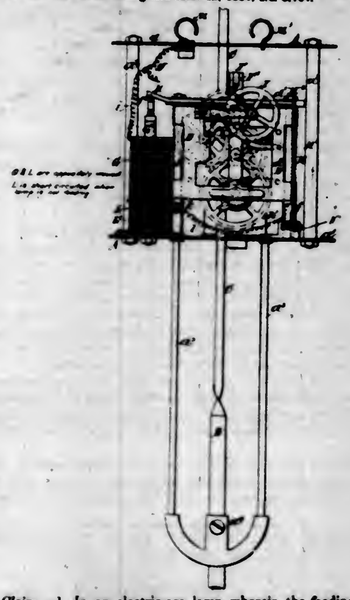
388,695. HARNESS-SADDLE. Andrew H. Larkin, Portland, Me. Filed Dec. 27, 1887. Serial No. 258,047. (No model.)

Claim.—In a harness-saddle, the combination of the skirt and pad with the metal loop-plate A, made as described and secured to the point or lower end thereof, substantially as and for the purposes set forth.

388,696. METHOD OF MAKING CANNON. Joseph P. Lavigne, New Haven, Conn. Filed Jan. 30, 1888. Serial No. 262,463. (No model.)

Claim.—1. A method of making cannon, consisting in preparing a tube to form the inner wall of the gun, then casting a filling over such tube, and then casting an envelope forming the outer wall of the gun over the tube and filling, so as to hermetically seal the latter between the tube and envelope, substantially as set forth.

2. A method of making cannon, consisting in preparing a tube to form the inner wall of the gun, then casting a filling over such



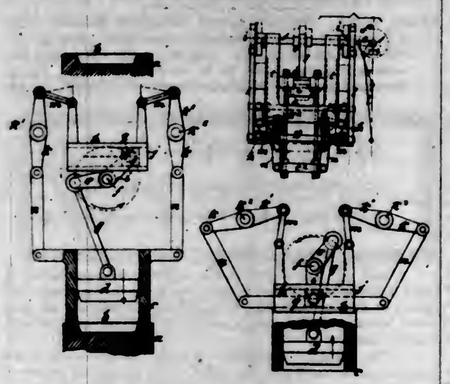
388,696.

tube, and then casting an envelope forming the outer wall of the gun over the tube and filling, the ends of the tube being fused by the envelope, substantially as set forth.

3. A method of making cannon, consisting in hermetically inclosing a cheap metallic filling between the inner and outer walls of a gun by beveling the ends of a tube forming the inner wall of the gun, then casting the filling over such tube, then casting an envelope forming the outer wall of the gun over the tube and filling, the beveled ends of the tube being fused in the last step, whereby the tube and envelope are virtually transformed into one piece of metal, substantially as set forth.

388,697. ARC LAMP. John Lea, London, England, assignor to Hugh Watt, same place. Filed Jan. 19, 1888. Serial No. 261,261. (No model.) Patented in England Mar. 12, 1887, No. 3,767.

Claim.—1. In an electric-arc lamp wherein the feeding of the carbon or carbons is effected by means of clock-work, a brake which acts upon a wheel of the said clock-work to control the movement thereof, and through which the current flows to and through the said wheel when the arc is normal, and which is actuated by a magnet or solenoid in a shunt from the main circuit, so that as the resistance through the arc increases the pressure of the brake upon the said wheel will be diminished, or the brake will be taken off, substantially as and for the purposes set forth.



2. In an electric lamp wherein the feeding of the carbon or carbons is effected by means of clock-work, the combination, with a brake which is actuated by a magnet or solenoid in a shunt from the main circuit to control the movement of the said clock-work, of a resistance-coil which will be switched into the said shunt when the brake is taken off, and will be short-circuited when the said brake is applied, substantially as and for the purposes set forth.

3. The combination, with the magnet or solenoid G, arranged in a shunt from the main circuit for actuating the brake H³, of a resistance-coil, L, wound in the reverse direction to the said magnet or solenoid and having a core within it, so that the extra resistance switched into the said shunt will energize the said core and counteract the said controlling-magnet or solenoid G, substantially as and for the purpose set forth.

4. The combination, with the clock-work for feeding the carbon or carbons and the magnet or solenoid E, for raising the said clock-work to form the arc, of the magnet or solenoid G, arranged in a

shunt from the main circuit, the lever H, carrying the brake H³ and connected with the armature or core G', the spring K, the coil L, arranged to be included in the said shunt to increase the resistance therein, or to be short-circuited by means of the said brake, and provided with the core L', arranged to act upon the said armature or core G', all substantially as and for the purposes set forth.

388,698. STAMPING-PRESS. Frank M. Leavitt, Brooklyn, N. Y. Filed Jan. 13, 1888. Serial No. 260,610. (No model.)

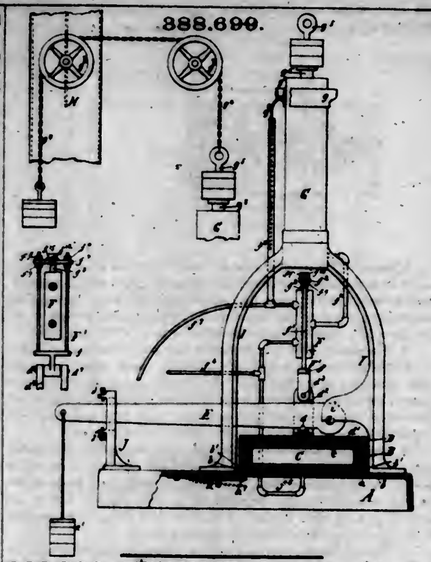
Claim.—1. In a press of substantially the described kind, the combination, with a fixed die, a reciprocating plunger, and a reciprocating and pressing blank-holder, of a toggle-link, *k*, a link connected to the toggle-link, a driving-crank connected by a reciprocating bar to the link, and a second toggle-link connected to first toggle-link and to the blank-holder, arranged and operating substantially as and for the purpose herein shown and described.

2. In a stamping or drawing press, the combination, with a fixed die and a reciprocating plunger and a reciprocating and pressing blank-holder, of a toggle-link, *k*, a toggle-link, *n*, connecting said blank-holder with said toggle-link *k*, a reciprocating driver or cross-head, *h*, a link, *m*, connecting said cross-head to said toggle-link *k*, and two driving-cranks, *e i*, set in opposite or nearly opposite positions, and one connected to said plunger and the other to said cross-head, arranged and operating substantially as and for the purpose herein set forth.

3. In a press, the combination, with the fixed die *a*, reciprocating plunger *d*, and reciprocating and pressing blank-holder *c*, of a centrally-arranged driving crank-shaft, *f*, and two cranks, *e i*, pitman *g*, connecting crank *e* and plunger *d*, cross-head *h*, connected to crank *i*, with the toggle-link *k*, toggle-link *n*, connecting said toggle-link *k* to the blank-holder, and link *m*, connecting the toggle-link *k* to the cross-head, substantially as herein shown and described.

388,699. DAMPER-REGULATOR. Frazer Lemmon, Philadelphia, Pa. Filed Mar. 17, 1888. Serial No. 267,994. (No model.)

Claim.—1. In a damper-regulator, the combination, with the weighted lever E, support I, and its connections, of the foundation-plate A, having steadying-pins *a a'*, one of which is movable, and the flanged piston-cylinder B, having notches *b'*, substantially as described.



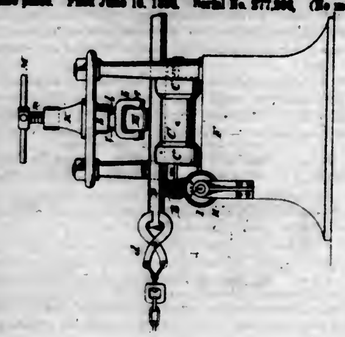
2. The combination of the damper-motor G and its support I, weighted lever E, cylinder B, piston C, hood D, having lugs d^2, side-rod frame F', and valve F, arranged in line with and below the motor G and within the support I, substantially as and for the purpose described.

3. The combination of the exhaust-pipe f^1, the open branch pipe f^2, leakage-pipe f^3, grooved collar *g*, and motor G, substantially as described.

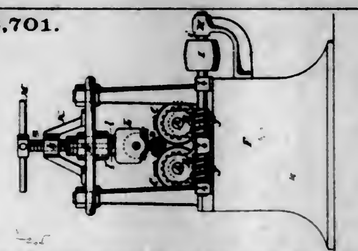
4. A damper-regulator comprising a cylinder, B, piston C, weighted hood D, having lugs d^2 and pin d^3, valve side-rod frame F', valve F, damper-motor G, arranged in the axial line of the valve and piston, pipes f^2 f^3, and pipe f^1, for supplying both the valve F and cylinder B, substantially as and for the purpose described.

5. The combination, with the cylinder B, piston C, lever E, valve F, and motor G, of the protecting finishing-hood D, provided with a knife-edge bearing, *d*, and constructed with a diameter sufficiently large with respect to the diameter of the cylinder to provide a space between itself and the cylinder, and thereby be capable of sliding laterally to accommodate the changes in position of the lever, substantially as described.

388,699.



388,700. SHEATHING-PAPER. Thomas Hardman, New York, N. Y. Filed June 7, 1888. Serial No. 276,572. (No model.)



Claim.—Building and sheathing paper whose surface is provided with nail-guide lines C, substantially as and for the purpose described.

388,701. STRAIGHTENING-MACHINE. William A. McCoy, Beaver Falls, Pa., assignor to the Hartman Steel Company, (Limited), same place. Filed June 16, 1888. Serial No. 277,206. (No model.)

388,701.

Claim.—1. The combination of rotary supports for a shaft, rod, &c., to be straightened, arranged at a distance apart, with a pressure-roller arranged to act upon the rod or shaft at a point between its rotary support and on the opposite side, and adjusting devices to adjust the rotary supports and pressure-roller to or from each other.

2. The combination of two rotary supports for a shaft, rod, &c., to be straightened, arranged at a distance apart, with a pressure-roller arranged to act upon the rod or shaft at a point between its rotary support and on the opposite side, and adjusting devices to adjust the rotary supports and pressure-roller to or from each other, and means to rotate said rotary supports with a uniform speed.

3. The combination of two grooved supporting-rollers having supporting parts arranged at a distance apart and upon which the rod or shaft to be straightened rests, mechanism to rotate said grooved rollers, and a pressure-roller arranged above said grooved rollers and adapted to press upon the rod or shaft in a direction corresponding to the grooved portions of said supporting-rollers.

4. The combination of two grooved supporting-rollers having supporting parts arranged at a distance apart and upon which the rod or shaft to be straightened rests, mechanism to rotate said grooved rollers, and a pressure-roller arranged above said grooved rollers and adapted to press upon the rod or shaft in a direction corresponding to the grooved portions of said supporting-rollers, and means for adjusting said pressure-roller to or from the grooved rollers.

5. The combination of two grooved supporting-rollers having supporting parts arranged at a distance apart and upon which the rod or shaft to be straightened rests, mechanism to rotate said grooved rollers, and a pressure-roller arranged above said grooved rollers and adapted to press upon the rod or shaft in a direction corresponding to the grooved portions of said supporting-rollers, and means for adjusting said pressure-roller to or from the grooved rollers, and means for pulling the rod or shaft longitudinally between the rollers.

6. In a machine for straightening rods, shafts, &c., the combination of supports for the rod, shaft, &c., arranged at a distance apart and adapted to support the rod, shafts, &c., at different places along its length, means to rotate the rod, shaft, &c., and a pressure-roller bearing upon the rod, shaft, &c., at a point in its length intermediate to the supports therefor.

7. In a machine for straightening rods, shafts, &c., the combination of supports for the rod, shaft, &c., arranged at a distance apart and adapted to support the rod, shafts, &c., at different places along its length, means to rotate the rod, shaft, &c., a pressure-roller bearing upon the rod, shaft, &c., at a point in its length intermediate to the supports therefor, an adjustable head for said roller, movable to or from said supports, and a screw-feed for said head to adjust it with reference to the supporting of the rods, shaft, &c., being acted upon.

8. In a machine for straightening rods, shafts, &c., the combination of a main frame, two parallel grooved supporting-rollers adapted to support the rod, shaft, &c., at two places along its length, gearing connecting said rollers to make them rotate in the same direction, power mechanism to rotate said rollers, a pressure-roller arranged above said supporting-rollers and above the grooved portions thereof, and adjusting devices to adjust the pressure-roller to or from the supporting-rollers.

9. A straightening-machine which consists of two grooved rollers and a friction-roller which bears upon the shaft or other material to be straightened over the space formed by the groove of said grooved rollers, and mechanism for rotating said grooved rollers.

388,702. INSECT-POWDER BLOWER. EDGAR W. MESSERSEAU, Brooklyn, N. Y. Filed Feb. 11, 1888. Serial No. 263,736. (No model.)

Claim.—The combination consisting of the main body of the box, the lid or cover composed of the exterior vertical and annular portion provided with the exterior horizontal and annular web, the leather, rubber, or textile fabric of the bellows held between the said web and the interior web forming a part of the interior vertical portion, the latter held in position by means of solder or indentation made in both the vertical and interior vertical portions aforesaid, two or more depending arms extending from the interior web, said arms adapted to support the lower portion of the depending spring, the upper end of the latter resting within the cup held against and to the bellows by means of the rivet, and the depressing-plate secured to the exterior of the device, substantially as shown and described.

388,708. TREATING PLANTS CONTAINING INDICAN. PAUL F. P. MUMMA, Port Orotava, Tenerife, Canary Islands. Filed Apr. 30, 1886. Renewed Feb. 21, 1888. Serial No. 264,732. (No model.) Patented in India Feb. 7, 1881, No. 97, and June 26, 1883, No. 181; in Queensland Oct. 19, 1883, No. 7, and in France Feb. 11, 1884, No. 160,599.

Claim.—1. The method of manufacturing indigo, consisting in the introduction into the indigo-liquor during the process of manufacture of caustic ammonia, which combines with the indican of the plant under treatment and produces a product of superior quality, substantially as described.

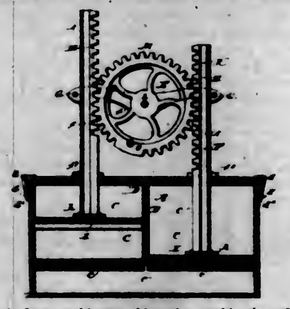
2. The method of manufacturing indigo by introducing nitrate or nitrite of ammonia into the indigo-liquor during the process of manufacture to accelerate the action of alkalies on the indigo-liquor and to act on the gluten of the plant which is in solution, substantially as described.

3. The method of manufacturing indigo by introducing ammonia into the indigo-liquor and oxidizing the indigo-liquor during the process of manufacture, substantially as set forth.

4. The method of manufacturing indigo by introducing ammonia and atmospheric and ozonized air into the indigo-liquor during the process of manufacture, substantially as set forth.

5. The method of manufacturing indigo by introducing ammonia into the indigo-liquor and agitating, oxidizing, and ozonizing the indigo-liquor during the process of manufacture, substantially as set forth.

388,704. ROAD-CART. LEVAN MILLER, Delaware, Ohio. Filed Apr. 19, 1888. Serial No. 271,153. (No model.)



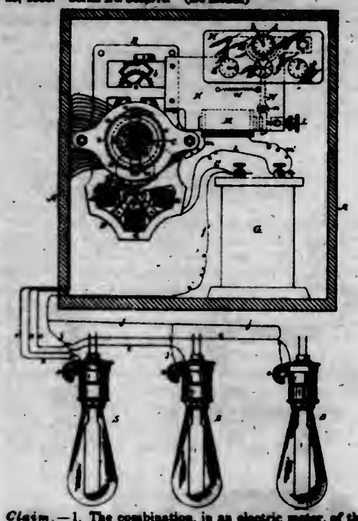
Claim.—1. The combination, in a road-cart, of the shafts A, provided with cross-bars B and C, an axle curved upwardly centrally, a brace bar or rod, F, with a central member, *f*, brace-bars L, extending from the axle to the cross-bar B, converging spring-bars K K, pivotally attached to the cross-bar B, the rear ends thereof being secured to a bar, I, attached to the upper portion of the rear spring, an overhanging rest mounted upon the rear ends of the spring-bars K, and a body suspended from the bar I and pivotally from the spring-bars K by means of spring-connections N, the parts being organized substantially as shown, and for the purpose set forth.

2. The combination, in a road-cart constructed substantially as described, of the converging spring-bars K K, upon which the seat is mounted, loops *l l*, to which the front ends of the spring-bars are pivotally secured, said loops being connected to the cross-bar B, so as to have a rocking movement thereon, and an elliptical spring connecting the rear portion of the spring-bars to the axle, substantially as shown, and for the purpose set forth.

388,705. FINGER-BAR. LORENZO D. MERRIAM, Rockford, Ill. Filed July 7, 1887. Serial No. 243,641. (No model.)

Claim.—The combination, with the finger-bar, of the rib fixed to the under face of the bar, the said finger-bar and rib being provided with rivet-holes, the rib having its rivet-holes farther separated than the holes in the finger-bar, whereby the bar is retained in its curved form, substantially as set forth.

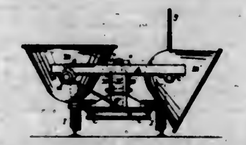
388,706. WASHING-MACHINE. WILBUR F. MOORE, Franklin, Ky. Filed Sept. 24, 1887. Serial No. 250,003. (No model.)



Claim.—1. In a washing-machine, the combination of the suds-box A, having the compartments C C, top bar secured on the upper side of the suds-box, castings F F, secured to the upper side of the bar and comprising the vertical arms *f f* and the horizontal arms *f'*, provided at the centers with aligned bearings *f''*, vertical sliding-dasher shafts H H, operating between the vertical arms of the adjacent castings F, and having the dashers I I on the lower ends to operate in the compartments C, the shaft journaled in the aligned bearings *f''*, and the gear-wheel M, secured on the said shaft and adapted to mesh with gear-teeth on the inner sides of the said dasher-shafts, whereby when the said wheel is rotated one of the shafts will ascend and the other will descend simultaneously, substantially as and for the purpose specified.

2. In a washing-machine, the combination, with the suds-box A, having the compartments C C, of the top bar, D, arranged across the said box, the parallel castings F F, secured to the upper side of the said bar, and having a horizontal arm, *f'*, provided with a bearing, *f''*, the vertical dasher-shafts H H, guided by the said castings and having gear-teeth on the inner sides, and the dashers I I on the lower ends to operate in the compartments C, shaft L, journaled in the bearings *f''* and extending forward beyond the same, the gear-wheel M, secured to the said shaft between the castings and meshing at opposite sides with the gear-teeth on the dasher-shafts, the lever N, secured on the front end of the shaft L, and having the depending arm P at the center, and the forwardly-extending bar O, secured to the wheel at the lower part and adapted to have the lower end of the arm P secured thereto, all constructed and arranged substantially as and for the purpose specified.

3. In a washing-machine, the combination, with the suds-box A, having the compartments C C, of the top bar, D, the castings F F, comprising the vertical arms *f f*, provided at the lower ends with the plates *f''*, adapted to be secured to the top bar, and the horizontal arm *f'*, provided at the center with the aligned bearings *f''*, the vertical arms *f* being also provided on the inner sides with the ribs or projections G', the vertical dasher-shafts H H, provided in the front and rear sides with grooves K K to receive the ribs or projections G', and also having the gear-teeth on the inner sides and the plates *h h* on the lower ends, the dashers I I, secured to the plates *h h* and adapted to operate in the compartments C C, shaft L, journaled in the bearings *f''*, gear-wheel M, secured to the said shaft and meshing with the gear-teeth on the dasher-shafts, and the lever N, secured to the shaft L and having a depending arm, P, connected at the lower end to the gear-wheel, all constructed and arranged substantially as specified.



388,707. ELECTRIC METER. HENRY G. MORRIS, Philadelphia, Pa., assignor to the Brush Electric Company, same place. Filed Feb. 25, 1888. Serial No. 265,378. (No model.)

Claim.—1. The combination, in an electric meter, of the registering mechanism, a magnet for actuating the same, a commutator controlling the said magnet and having independent terminals connected to the different lamps of the system, an actuating-spring for said commutator, an electric motor, and winding-gear operated thereby and connected to the commutator-actuating spring, all substantially as specified.

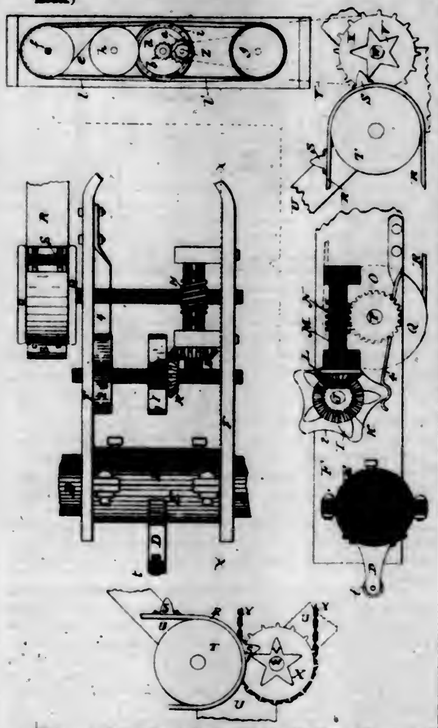
2. The combination, in an electric meter, of registering mechanism, a magnet for actuating the same, a commutator controlling said magnet and having independent terminals connected to the different lamps of the system, an actuating-spring for said commutator, an electric motor and winding-gear operated thereby and connected to the commutator-actuating spring, and a single battery supplying the circuits both for the register-operating magnet and for the winding-motor, all substantially as specified.

388,708. DUMPING-CAR. JOHN W. MERRITT, Denver, Colo., assignor to the Colorado Iron Works, same place. Filed May 1, 1888. Serial No. 272,464. (No model.)

Claim.—1. In combination, a suitable truck frame and wheels, and a receptacle-carrying frame centrally supported on the truck-frame, the receptacles pivotally supported upon opposite sides of the central support to swing outwardly, said frame being balanced by the receptacles upon opposite sides, substantially as described.

2. In combination with a suitable truck frame and wheels, a receptacle-carrying frame, as A A' D D', swiveled to said truck-frame, so as to have movement in a horizontal plane, and the receptacles pivotally supported upon opposite sides of said receptacle-carrying frame, substantially as described.

3. In combination, the truck-frame, the beam F, the bars D D', the block E, the supporting-pin *d'*, the beams A A', and the receptacles pivoted thereto, substantially as described.



4. In combination, the receptacle-supporting frame centrally swiveled, the receptacles pivoted thereto and upon opposite sides of the swivel, the journals of said receptacles being outside the central vertical plane, and limiting-stops for the receptacles, whereby they will remain normally in upright position and swing outwardly when released, substantially as described.

5. In combination, the frame A A', the receptacles pivoted therein,

and the collar or head *d* upon one of the journals and provided with holes to receive a suitable operating-bar, substantially as described.

6. In combination, the pivoted receptacles, the collar or head *d*, provided with teeth, and the catch *e*, substantially as described.

388,709. STREET OR STATION INDICATOR. Charles F. Nicklas, Los Angeles, Cal. Filed Oct. 6, 1887. Serial No. 251,894. (No model.)

Claim.—1. In a station-indicator, the combination, with a car and its indicator proper, of an endless studded belt mounted upon the car and connected by intermediate mechanism with the apron of the indicator, and an arm mounted upon the car-axle to actuate the studded belt and impart an intermediate motion thereto.

2. In a station-indicator, the combination, with a car and its indicator, of a star-wheel, V, a band communicating motion from the star-wheel V to the indicator, a second star-wheel, I, mounted upon the car, a connection between the two star-wheels, and an arm mounted upon an axle of the car and adapted to strike the star-wheel I at each revolution.

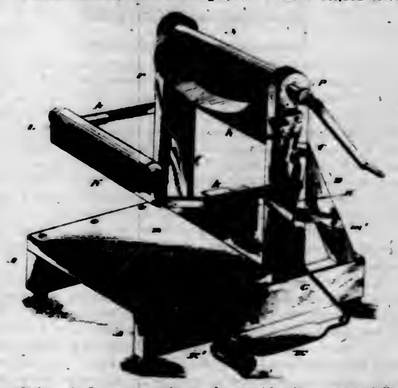
3. In a station-indicator, the combination, with a car and its indicator, of a star-wheel, V, a band communicating motion from the wheel V to the indicator, a second star-wheel, I, mounted upon the car, an arm carried by the car-axle and adapted to strike the wheel I, a belt, R, provided with spurs S to actuate the star-wheel, and gearing for transmitting motion from the star-wheel I to the belt R.

4. In combination with a car and its indicator, an arm, D, carried by the car-axle, a star-wheel, I, located in the path of the arm, a second star-wheel, V, also journaled in the car, a belt, R, provided with spurs S and arranged to actuate the wheel V, a band, Y, communicating motion from the star-wheel to the indicator, and a spring, 4, adapted and arranged to prevent the accidental operation of the indicator.

5. In combination with a car and its indicator, the arm D, secured to the car-axle, a shaft, J, journaled in the frame-work and provided with star-wheel I and bevel-gear K, a shaft, M, also journaled in the frame and provided with worm N and gear L, a shaft, P, arranged parallel with shaft J and provided with gear O and band-wheel Q, a frame, U, provided with band-wheel T and shaft W, star-wheel V and sprocket-wheel X, mounted upon the shaft, a belt, R, provided with spurs S and passing about the wheels Q T, and a chain or band, Y, passing about the sprocket-wheel X and about the wheel of the indicator proper.

6. In an indicator, the combination, with a casing, of the rollers *f g*, journaled therein and connected with their shafts by reversely-acting pawls and ratchets, an apron, *c*, secured at opposite ends to the rollers *f g*, and mechanism for imparting motion to the apron.

7. In combination with the casing, the rollers *f g*, journaled therein, an intermediate roller, D, an apron, *c*, secured at its ends to the rollers *f g* and passing over the face of roller *d*, belts *l* and *l'*, passing, respectively, about the rollers *f*, *g*, and *d*, all substantially as shown, and mechanism for imparting motion to the apron.



8. In combination with a casing, the rollers *f g*, journaled therein and provided with ratchets *o o'*, an intermediate roller, *d*, provided with pulley *i*, an apron, *c*, connected at opposite ends with the rollers *f g*, pulleys *m* and *n*, mounted loosely upon the shafts of the rollers *f g* and provided with pawls *r r'* to engage the ratchets *o o'*, belts *l l'*, passing about the pulleys *m*, *n*, and *i*, all substantially as shown, and mechanism for imparting motion to the apron.

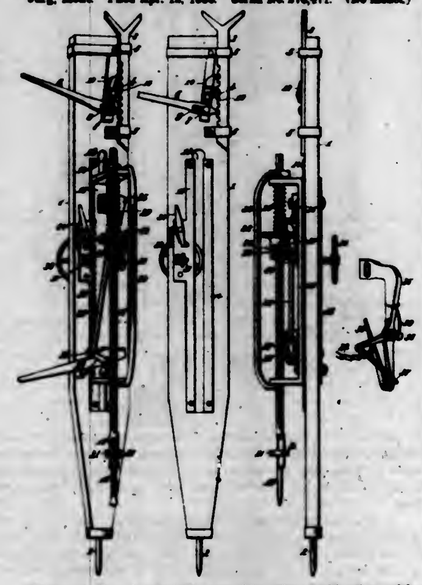
9. In combination with a casing, rollers *f g*, journaled therein, an apron, *c*, secured at its ends to the rollers, a roller, *d*, interposed between the rollers *f g*, a roller, A, arranged parallel with roller *d* and adapted to press the apron upon the latter, and mechanism for imparting motion to the apron.

10. In combination with a suitable frame-work or casing, rollers *f g*, journaled therein and provided with pawls *r r'*, apron *c*, secured to the rollers *f g*, pulleys *m* and *n*, mounted upon the roller-shafts and provided with ratchets *o o'*, intermediate rollers, *d* and A, the former provided with pulley *i*, belts *l l'*, connecting the pulleys *m* and *n* with the pulley *i*, a gear-wheel, *b*, secured to the shaft of roller *d*, and a gear-wheel, *a*, and sprocket-wheel Z, mounted in the casing, all substantially such as shown.

11. In combination with a car and its indicator proper, a bracket or frame, F, journaled upon one of the car-axles, a rod, G, pivoted at one end to the car and connected at its other end to the bracket or frame F, and mechanism for actuating the indicator-apron, mounted partly upon the bracket or frame F, whereby the car-trucks are permitted to rise and fall independently of the car-body without affecting the operation of the indicator.

388,710. MOP-WRINGER. Elbridge H. Noble and Charles R. Warren, Postville, Iowa. Filed Aug. 4, 1887. Serial No. 246,144. (Model.)

Claim.—1. In a mop-wringer, the combination, substantially as set forth, of a supporting-frame provided with vertical standards having a roller mounted in their upper ends, a transverse rod, A, journaled in the standards, having a lifting-arm secured to one of its ends and a crank-arm secured to its opposite end, a treadle attached to the lower part of the frame and connected to the lifting-arm, a bail, K, pivoted to the lifting-arm and to the crank *h'*, said bail carrying a roller, L, and provided with inwardly-projecting plates *k*, and guides M, secured to the upper part of the standards, with which the plates *k* are adapted to engage.



2. In a mop-wringer, the combination, substantially as described, of the frame, the transverse rod A, the lifting and crank arms H and *h'*, secured to the ends of said rod A, the serrated pawl *l*, attached to the lifting-arm, the stop *g*, with which said pawl *l* is adapted to engage, the bail carrying a roller and having inwardly-projecting plates *k*, the guide M, adapted to be engaged by the plates *k* of the bail, a treadle attached to the lower part of the frame having members E and E', and a link-rod, G, connecting the free end of the member E of the treadle with the lifting-arm H.

3. In a mop-wringer constructed substantially as described, the combination of a swinging bail having a roller journaled therein and provided with inwardly-projecting plates *k*, and guides M on the standards of the frame, with which said plates *k* engage, said guides having outward projections *o* and *o'* and pawls *p*, as set forth.

4. In a mop-wringer, the combination, substantially as described, of the frame having standards carrying a roller in their upper ends, the transverse rod having bearing in said standards, the lifting and crank arms respectively attached to the opposite ends of the said rod, the bail pivotally attached to the crank and lifting arms and carrying a roller, and a treadle connected to the lifting-arm.

5. In a mop-wringer, the combination, with the frame having standards carrying a roller, the lifting and crank arms on opposite sides thereof, and the swinging bail carrying a roller attached at its ends to the lifting and crank arms, of the angle-iron *a*, secured to the one side of the base-frame, forming a bearing and having a downward projection, *a'*, at its outer end, the treadle composed of the members E and E', and the rod G, connecting the free end of the member E with the lifting-arm, substantially as described.

388,711. ROCK-DRILLING MACHINE. John A. Parmley, Radersburg, Mont. Filed Apr. 12, 1888. Serial No. 270,471. (No model.)

Claim.—1. In a hand drilling-machine, the combination, with a drill-frame vertically adjustable upon a supporting-post, of a spring-actuated drill-stock mounted in said frame, a clevis fulcrumed on the frame and connected to the drill-stock, and a lever straddled by the clevis and having its fulcrum upon the pivotal point of the latter, substantially as described.

2. In a hand drilling-machine, the combination of a supporting-post, a drill-frame adjustable along the post, a spring-impelled drill-stock, a clevis pivoted to the drill-frame, a rod pivoted to the clevis and connected with the drill-stock, a hand-lever straddled by the clevis and fulcrumed upon the pivot of the latter, a ratchet-wheel on the drill-stock, a bracket-arm secured to the drill-frame and having an elastic arm arranged in the path of the ratchet-wheel, and an inclined spring-impelled trigger pivoted on said bracket-arm, substantially as described.

3. The combination, with the supporting-post having the drill-frame adjustable thereupon, of guides on the end portion of the post, a rack-bar sliding on the post in said guides and having a bifurcated outer end, a pivot or fulcrum on the post, a swinging and longitudinally-movable hand-lever provided with a longitudinal slot engaging the pivot or fulcrum, and pawls on the post engaging the sliding rack-bar, substantially as described.

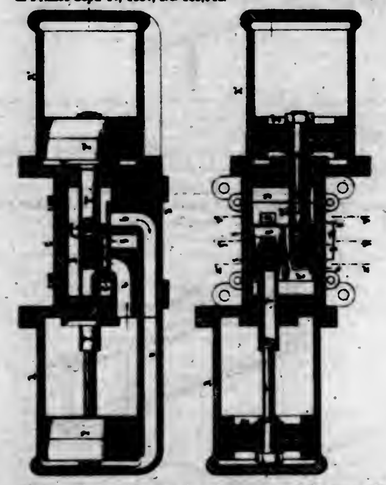
4. In a hand drilling-machine, the combination, with a supporting-post having a longitudinal slot, of a drill-frame having its supporting-bolts adapted to slide in said slot, a pinion meshing with a rack on the drill-frame, a spring-actuated drill-stock, a lever fulcrumed on the drill-frame, and a clevis straddling said lever and connected to the drill-stock by a connecting-rod, substantially as described.

5. In a hand drilling-machine, the combination, with a supporting-post, of a longitudinally-adjustable drill-frame, a spring-actuated drill-stock moving therein and having a ratchet, a clevis pivotally mounted on said frame and connected to the drill-stock by a pivoted connecting-rod, a lever straddled by the clevis and having the pivot of the clevis, an elastic detent engaging with a ratchet, and a spring-actuated trigger pivotally mounted on the bracket-arm carrying the detent, said trigger being inclined relatively to and lying in the path of the ratchet during part of its upward stroke, substantially as described.

388,712. FRAME FOR PHOTOGRAPHS, PICTURES, &c. Hilarius Patterer, Jersey City, N. J. Filed Nov. 18, 1887. Serial No. 255,189. (No model.)

Claim.—1. The frame A, having an opening, *a*, combined with the back board, B, and the glass *b*, carried by said back board, and with a picture-holder on said back board and behind said glass, whereby the picture and glass may be carried by the back board wholly independent of the frame, substantially as described.

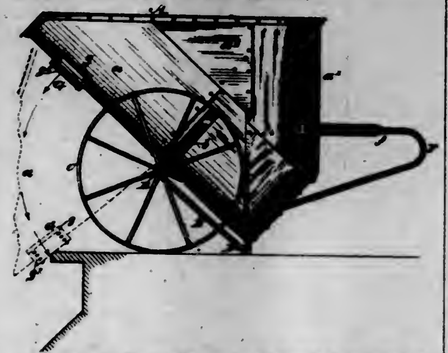
2. The combination of the frame A, having an opening, *a*, back board, B, having cleats *f*, and recesses in said cleats for the reception of a picture, whereby the picture may be carried by the back board and independent of the frame, substantially as described.



3. The combination of the open frame A, hinged back board, B, having recessed cleats *f f*, and glass *b*, held on said cleats in front of the picture-recesses of said cleats, substantially as described.

388,713. PRINTER'S TYPE. James G. Pavyer, St. Louis, Mo. Filed June 14, 1887. Serial No. 241,374. (No model.)

Claim.—A type having the foot or bottom of the base solid and of the full area of the type and recess in the side, leaving the type solid at each of the four vertical corners and a supporting-wall beneath the center of the face.



388,714. PISTON METER. Pierre Perret, Chaux-de-Fonds, Switzerland. Filed May 31, 1888. Serial No. 275,572. (No model.) Patented in France Sept. 17, 1887, No. 185,911.

Claim.—The combination, in a fluid-motor, of the two cylinders, the chest interposed between and secured to the inner adjacent ends of the cylinders, the ports leading respectively from the chest to the front and rear ends of the cylinders, the two sliding valves arranged side by side and both located above the said ports to the cylinders, the two sleeves sliding respectively through the opposite ends of the chests and each secured directly to one of the sliding valves, from which they extend in opposite directions, and the pistons having rigidly-attached piston-rods extending into and sliding within the sleeves

and provided with shoulders, substantially as and for the purposes described.

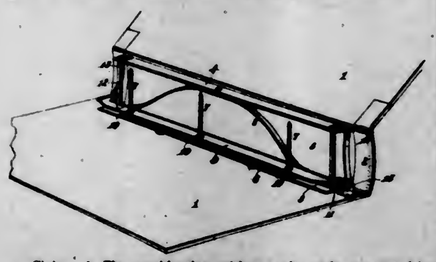
388,715. BARROW. William H. Pearl, West Hentmont, Pa. Filed Apr. 21, 1888. Serial No. 271,296. (No model.)

Claim.—1. The wheelbarrow herein described, consisting of a body portion composed of the bottom part, *a*, curved in a transverse direction to its length, the back parts, *a'*, and the sides a^2, connecting said bottom and back parts and provided with an axle and wheels, handle, and feet, said parts being combined substantially as described.

2. In a wheelbarrow, a body portion consisting of a bottom piece, *a*, curved in a transverse direction to its length, the back part, *a'*, and the sides a^2, connecting said bottom and back, said parts being combined substantially as and for the purpose set forth.

3. A wheelbarrow having the body A with bottom part, *a*, curved in a transverse direction to its length, the axle B, and wheels C, a handle secured to the body on the side opposite to the discharge side, and a bumper secured on the central line of said bottom part, *a*, said parts being combined substantially as described.

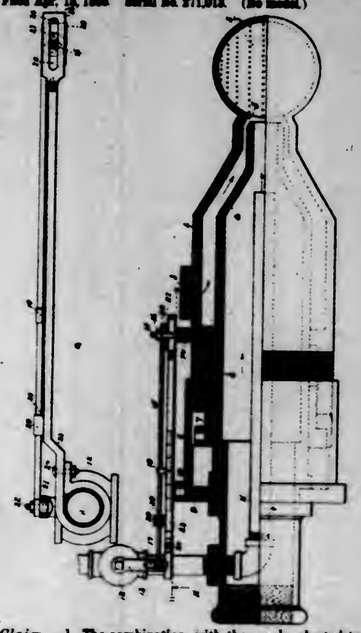
4. In a wheelbarrow, the combination of the body portion, an axle with wheels, feet D, and brace-bar E, connecting said feet D to the axle, substantially as and for the purpose set forth.



388,716. FUSE-LIGHTER. William H. Randall, Chicago, Ill. Filed June 6, 1888. Serial No. 276,232. (No model.)

Claim.—1. A fuse-lighter consisting of a strand of wire coiled upon a candle-wick and formed into hooks for inclasping the fuse, substantially as shown and described.

2. A fuse-lighter having a coiled portion for securing a compact and inflammable candle-wick and right-angular portions provided with outer hooked ends, as shown and described.



388,717. TEMPORARY BINDER. William D. Ready, New York, N. Y. Filed Mar. 28, 1887. Serial No. 232,680. (No model.)

Claim.—1. The combination, with opposite stubs connected by notched guide-rods, of pins projecting from one of said stubs, a clip mounted on said guide-rods and adapted to be moved endwise to engage the notched ends of said rods, said clip being provided with perforations to engage the pins that project from one of the stubs, and a spring to force the clip onto said pins when disengaged from the guide-rods, substantially as described.

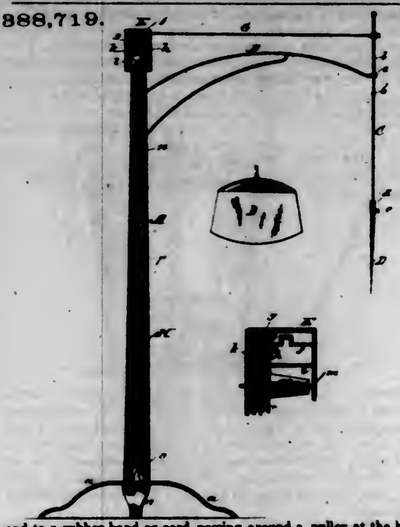
2. The combination of the stubs 3 and 4, of unequal width, the pins 7, connected with the wider stub and projecting slightly above the narrow stub, the guide-rods 12, having notches 13, the clip 9, mounted on said guide-rods and provided with perforations 10, to engage the pins, and the spring 8, to force the clip onto said pins, substantially as described.

388,718. HYDROCARBON-BURNER. Joseph Ross, Oil City, Pa. Filed Apr. 13, 1888. Serial No. 271,013. (No model.)

Claim.—1. The combination, with the nozzle adapted to reciprocate for regulating the admission of steam, and a pipe having the valve for governing the admission of oil, of a scale and a rod connected to said nozzle and valve and carrying an index-hand, as set forth.

2. The combination, with the nozzle capable of reciprocating, and the oil-pipe having a cock, of a lever for operating said cock, a lug on said nozzle, a rod connecting said lever and lug, a fixed strip or rod, 23, and a scale and index-hand carried by said strip 23 and rod, respectively, as set forth.

3. The combination, with the nozzle 1, having a lug thereon, and the oil-pipe having a cock thereon, of a lever for operating said cock, and two approximately parallel rods having a scale and index-hand, respectively, the one of which rods being secured to said oil-pipe and the other to said lever and lug, substantially as set forth.

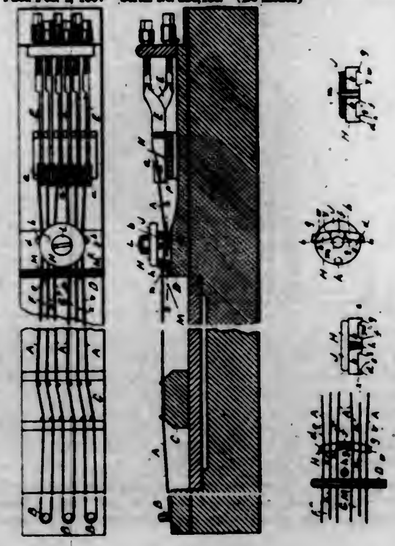


4. In a hydrocarbon-burner, the combination, with the nozzle 1, adapted to reciprocate for regulating the admission of the steam, and the oil-pipe 11, having a cock, of a lever having a slot for operating said cock, a lug on said nozzle, a pin projecting from said lug, the rod 18, having a perforation at one end, fitting over said pin, an anti-friction roller journaled to the other end of said rod and working in said slotted lever, the rod or strip 23, secured to said oil-pipe and having a slotted end fitting over said pin, and an index-hand and scale carried by said rods 18 and 23, as set forth.

5. In a hydrocarbon-burner, the combination, with the nozzle 1, the oil-pipe 11, having a cock, and a lever, 13, for operating said cock, of the lug 14 on the nozzle 1, having the pin 15, provided with a nut, the rod 18, secured to lever 13 and having the index-hand thereon, and perforated plate 20, fitting over said pin, the rod or strip 23, having a scale thereon, riveted around said oil-pipe, and having a plate at right angles to its face, provided with a slot, through which said pin passes, one of said rods being bent to make it parallel with the other, and a washer between said rods, as set forth.

388,719. FLY FAN OR BRUSH. Henry Reisner, White, Tex. Filed Apr. 5, 1887. Serial No. 233,702. (No model.)

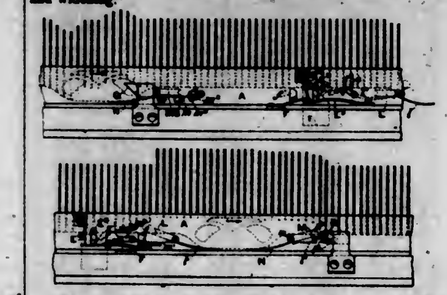
Claim.—1. In an automatic fly fan or brush, a suitable hollow post terminating at its upper end in a casing, a crank-shaft and conical pulley located therein, and gearing connecting the crank-shaft with the pulley-shaft, in combination with a cord connected to the pulley



388,719.

and to a rubber band or cord passing around a pulley at the base of the post, said rubber cord or band at one end being connected thereto, a pitman-rod connecting the crank-shaft with the arm carrying the fan or brush, said arm being adjustably connected to its pivotal support, substantially as and for the purpose set forth.

2. The improved fly-fan described, consisting of the hollow post A, provided with legs *a*, and enlarged at its upper end to form a casing, B, arm B, connected to said post, near the top thereof, and braced, as shown, the fan-carrying arm C, pivoted to said arm, transverse shafts *i m*, and crank-shaft *f*, journaled in said casing, pinion *g* on the shaft *f*, gear-wheel *h* and pinion *k* on the shaft *i*, the gear-wheel *l* and conical pulley F on the shaft *m*, the pitman-rod G, connecting said crank-shaft and arm C, the pulley *o*, journaled in the bottom of said post, cord *n* within said post and secured at one end to the larger end of said conical pulley, and the elastic band H, arranged within said post, passed under said pulley *o*, and secured at one end to the interior of said post and at the other to the other end of the cord *n*, all substantially as shown and described, and for the purpose specified.



388,720. PIANO-FORTE. John P. Richardson, Cambridge, assignor to the Mason & Hamlin Organ and Piano Company, Boston, Mass. Filed Feb. 1, 1887. Serial No. 226,189. (No model.)

Claim.—The combination, with the strings of a piano representing two notes, of a plate or bar, J, having an under bearing-edge, *i*, for the strings and legs *d f g* A, by which it rests upon the iron frame and secured thereto by a screw passing through a central opening in the plate, the legs *d f g* having side bearing-edges, for the purpose specified.

388,721. CIRCULAR-KNITTING MACHINE. Harry C. Reisner, Philadelphia, Pa., assignor of one-half to Thomas A. Pearce, same place. Filed May 10, 1887. Serial No. 237,778. (No model.)

Brief.—The invention consists in the improved means for raising needles to the idle level collectively as well as individually and for depressing them in the same manner during the process of narrowing and widening.

Claim.—1. The combination, with the cam-cylinder, of the lifting-cam E, arranged in guides formed within the ring D, means, substantially as set forth, whereby said cam may be raised and maintained raised during a portion of the cylinder's rotation, and the cam G, whereby on reaching the desired limit the cam E is thrown down flush with the top of said ring, as and for the purposes specified.

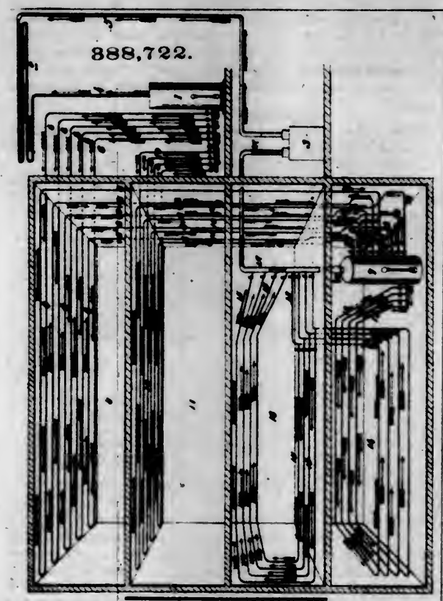
2. The combination, with the lifting-cam E, arranged with reference to the ring D substantially as set forth, of the cam-cylinder having the slot E^2, pin E', a spring arranged beneath said pin, a detent engaging with said spring, and means, substantially as set forth, whereby said detent may be tripped and the spring permitted to rise at a definite point in the rotation of the cylinder, as and for the purposes specified.

3. The combination, with the cam-cylinder having vertical cavities in its ring D, of the lifting-pawls L M, pivoted within said cavities and provided with actuating-springs *l* N, respectively, the spring-fingers engaging beneath the under side of said pawls, the stems carrying said fingers and extending out through the periphery of the cam-cylinder, and means, substantially as set forth, whereby said fingers may be raised and lowered and secured in a raised position.

4. The combination, with the spring-actuated lifting-pawl, of the spring-actuated finger on which it rests, the stem and winch connected therewith, and the funnel-shaped cam *f'*, adapted when thrown into play to engage with and move said winch into the position for raising the finger, as and for the purposes set forth.

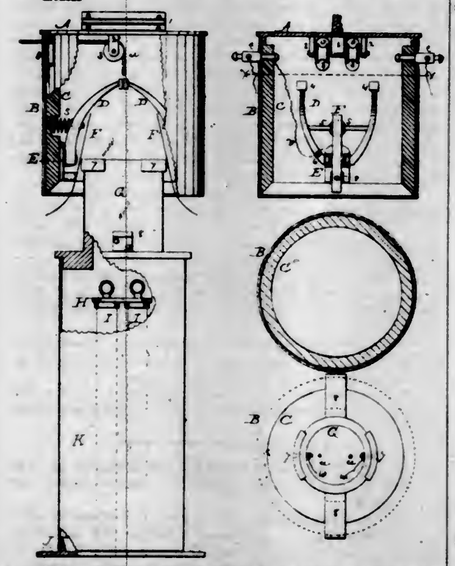
5. The combination, with the depressing-pawl, of the springs $A' A^2$, arranged substantially in the manner set forth, to hold the pawl at a definite angle on either side of its central position, substantially as specified.

6. The combination, with the depressing-pawl, of a fastening device, substantially as set forth, whereby said pawl may be rigidly secured to operate as a cam, in the manner specified.



7. The combination, with the depressing-pawl, of the pin P', collar U', nut P^3, and spring *s*, substantially as and for the purposes set forth.

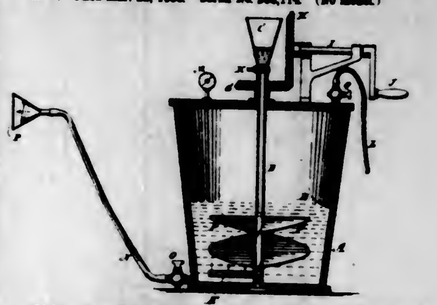
388,722. AMMONIA SYSTEM FOR COOLING ROOMS, &c. John Ring, St. Louis, Mo. Filed Apr. 28, 1887. Serial No. 236,576. (No model.)



Claim.—1. In combination with a pump, an accumulator and a receiver, pipes forming a communication between said receiver and the accumulator, and a pipe forming a communication between the accumulator and receiver, the area in cross-section of the inlet-pipe of the accumulator being greater than the area of the outlet-pipe, and said pipes being arranged, respectively, to cool one or more rooms, substantially as set forth.

2. In an ammonia cooling system, the combination of the receiver 1, condenser 2, pump 3, pipe 5, pipe 6, communicating with the receiver and located within a room, accumulator with which the pipes 6 communicate, pipes 13, located within a room and communicating with the accumulator, pipes 15, communicating with the pipes 13 and located within a room, 16, and a pipe, 12, with which the pipes 15 communicate, substantially as and for the purpose set forth.

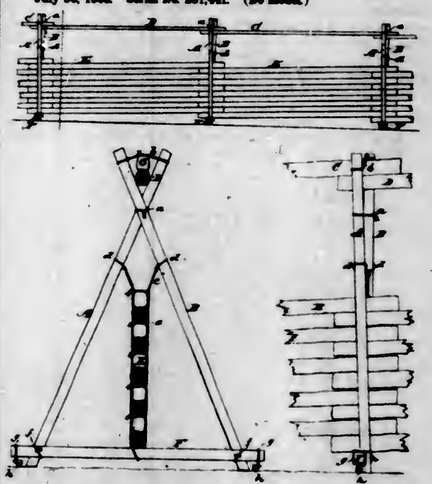
388,722.



388,723. ELECTRIC-ARC-LIGHT SUPPORT. Benjamin Schardt and Gronen Journ, Dayton, Ohio, assignors of one-third to John R. Fletcher, same place. Filed Jan. 25, 1883. Serial No. 261,236. (No model.)

Claim.—1. The hood comprising the top plate, A, with clamp 1 for the suspending-cable and lugs 2 for the pulleys, the metallic outer cylinder, B, and the wooden or insulating inner cylinder, C, in combination with the spring-actuated connecting-pieces D D, pivoted to the said insulating-cylinder, the spring-plate connections F F, attached thereto, and the connecting-plate 7 7 of the shield, attached to an electric lamp to form two circuits alternately with the generator, one external to the lamp and the other through the same, substantially as set forth.

2. The shield comprising the wooden part G, having plates 7 7 and the arresting-lugs 8 8, the metallic cylinder K, and the flange J, for attachment to the top plate of an arc lamp, substantially as set forth.



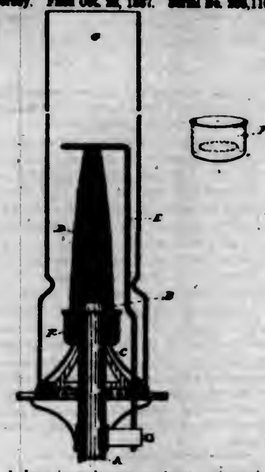
388,724. MIXING APPARATUS. Richard Schuch, New York, N. Y. Filed Mar. 22, 1888. Serial No. 268,114. (No model.)

Claim.—1. A liquid-mixing apparatus consisting of the reservoir A, having a delivery-outlet, N, a vertical axially-rotating liquid-conducting-tube, D, having rigidly-attached stirrer-blades F, and a lateral arm, E, below said blades, provided with perforations, a gear, G, fixed on the tube, a liquid-holding hopper, C, connected with the upper end of the tube above said gear and provided with a stop-cock, K, and a rotary gear, H, for revolving the gear fixed on the tube, substantially as described.

2. A liquid-mixing apparatus consisting of the reservoir A, having the valved outlet N at its bottom and an air-forcing tube, L, at its top, the vertical axially-rotating liquid-conducting tube D, having the rigidly-attached perforated arm E, and screw-blades F, revolving with the tube in a horizontal plane, a gear, G, fixed on the tube above the top of the receiver, a liquid-holding hopper, C, mounted upon the upper end of the tube above the said gear and provided with a stop-cock, K, and a gear, H, for revolving the gear fixed to the tube, substantially as described.

388,725. FENCE. Nathaniel Shapteall, Flint, assignor of one-half to John J. Kinney, Angola, Ind. Filed Jan. 27, 1887. Renewed July 30, 1888. Serial No. 281,441. (No model.)

Claim.—The herein-described fence, consisting of the crossed posts A B, binding-wire *a*, transverse anchor-bar F, wire *c*, passed under said bar and having its ends secured to said posts, rails E, supported by said wire *c*, the loops *f*, pivotally securing said bar to the lower ends of the posts, the stakes A, and wire loops *g*, embracing the ends of said bar and secured to said stakes, whereby said posts, rails, and anchor-bar are free to vibrate laterally, all substantially as shown and described, and for the purposes specified.

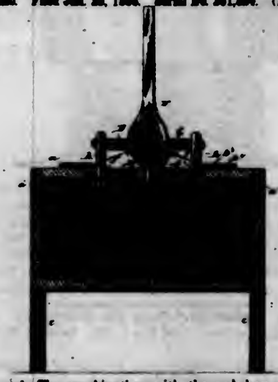


388,726. ARTIFICIAL-STONE COMPOSITION. Charles A. Shaw, Philadelphia, Pa., assignor of one-half to John W. Shaw, Central City, Nebr. Filed June 14, 1888. Serial No. 277,103. (No specimens.)

Claim.—1. The within-described compound of rock-salt, muriatic acid, and sal-ammoniac as a binder for an artificial-stone composition.

2. A compound in which a body, such as clay, sand, loam, &c., is mixed with a chemical binder composed of rock-salt, sal-ammoniac, and muriatic acid, substantially as described.

3. A compound of rock-salt, muriatic acid, and sal-ammoniac, mixed with a body material and with coal-tar, substantially in the manner and proportions set forth.

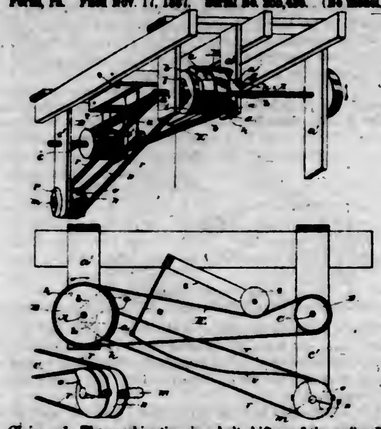


388,727. INCANDESCENT GAS-LAMP. Henry Shaw, New Orleans, La., assignor to the Wabash Incandescent Gas Light Company, of New Jersey. Filed Oct. 28, 1887. Serial No. 253,116. (No model.)

Claim.—1. In an incandescent gas-lamp, a protecting-cup adapted to receive and protect the lower end of a fragile mantel, substantially as described.

2. The combination of the burner and the incandescent mantel suspended above the burner and having its lower edge below the burner-outlet and the protecting-cup below and surrounding the lower edge of said mantel to shield it from injury, substantially as described.

388,728. WASHING-MACHINE. Josiah Shepherd, Jeffersonville, Ohio. Filed Jan. 26, 1888. Serial No. 261,894. (No model.)



Claim.—1. The combination, with the suds-box, of the lid, the rotatable circular turn-table mounted in the lid and forming in connection with the same a complete cover for the suds-box, the lever mounted on the turn-table, and the plunger connected to the lever and extending through the turn-table into the suds-box, as specified.

2. The combination, with the suds-box and the cover making a steam-tight joint therewith, of the turn-table attached to the cover, the shaft journaled thereupon, the lugs rising from said turn-table, the lever-handle pivoted on said shaft, the transverse bars secured to said lever above its pivotal point, the plunger-rods, and the plungers, substantially as specified.

3. The combination, with the suds-box and the lid of the turn-table comprising the upper plate, *b*, and the lower plate, *b'*, secured together by bolts, the lever mounted on the turn-table, and the plungers connected to the lever, as set forth.

4. In a washing-machine, a suds-box having the door *a*, provided with a circular opening having the beveled recess *b*, the turn-table B, comprising the outer plate, *b*, having the beveled edge *b'* to rest in the recess *b*, and the inner plate, *b'*, connected to the outer plate by pins and bolts and engaging under the lid or cover *a* around the opening therein, and the plunger and operating-connections mounted on the turn-table, as set forth.

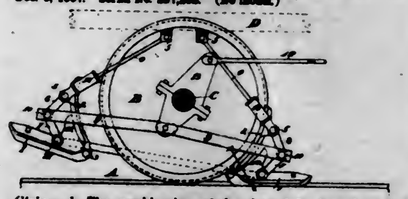
388,729. BELT SHIFTER AND TIGHTENER. Samuel Shive, Perin, Pa. Filed Nov. 17, 1887. Serial No. 255,436. (No model.)

Claim.—1. The combination, in a belt-shifter, of the pulley B, the belt E, the guard-plates having the arms hinged or pivoted to the axis of the pulley, and the revolubie disk loose on the same shaft with pulley B, and having the steps to swing the guard-plates around the pulley, and thereby cause the same to pass between the pulley and the belt and release the latter therefrom, substantially as described.

2. The combination of the shaft A, having the pulley B, the countershaft C, having the pulley D, the endless belt connecting the pulleys B and D, the guard-plates having the arms pivoted to the shaft A, the disk journaled on shaft A, adapted to engage and operate the guard-plates, the pivoted frame having the pulley or roller adapted to bear upon the belt to tighten the same, the shaft *n*, and connecting-straps between the same and the disk and the frame *s*, whereby the said disk may be caused to interpose the guard-plates between the pulley D and the belt and simultaneously cause the frame *s* to raise the pulley or roller from the belt, substantially as described.

3. The combination, in a belt-shifter, of the pulley B, the belt E, the guard-plates having the arms pivoted to the axis of the pulley and adapted to be swung thereon, for the purpose set forth, and the stops to retain the guard-plates in position, substantially as described.

388,730. ROLLER-MILL. Alpheus J. Sheets, Bloomville, Ohio. Filed Jan. 31, 1888. Serial No. 262,826. (No model.)



Claim.—1. The combination, with the case and the rolls journaled therein at an angle, as described, of the feeder-box pivoted in said case above the upper roll, the shaker-bar *i* on the pivot of said box, and the cam on the shaft of the upper roll and acting on said shaker-bar, substantially as described.

2. The combination, with the case and the roll B, journaled therein, of the movable rolls C, the bars D, forming bearings therefor, the bars E, pivotally connected with the case at one end and pivotally connected with the bars D, the bars G, a yielding connection between said bars G and E, and the rock-shaft K, journaled on said case, with its ends acting on the bars E, substantially as shown and described.

3. The combination, with the case, the rolls B C, the bars D, and the bars G, of the bars E, pivotally connected with the said case and with the bars D, the set-screws H, tapped through the bars G and bearing on the bars E, the tension-screws I, and the springs *e* on said screws, substantially as shown and described.

388,731. CAR-BRAKE. Joseph W. Sims, Cincinnati, Ohio. Filed Dec. 8, 1887. Serial No. 257,202. (No model.)

Claim.—1. The combination of the shoes 1 2, pivoted at their forward points and connected by link-levers 6 7, and hinged to a connecting-rod, 9, suspended upon the oscillating lever 13, for raising and lowering the brake and simultaneously to move the toggles, substantially as specified.

2. In combination with the brake-shoes 1 2, hinged together and suspended by an operating-lever, the suspension-rod 4, attached to the car-frame, and the link 9, connected to a lever attached to the car-axle, substantially as specified.

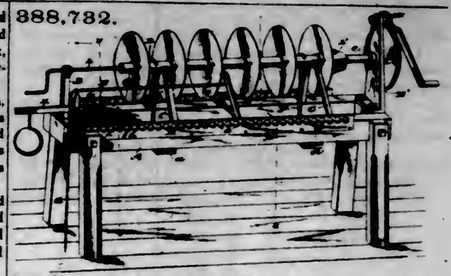
3. In combination with the shoe-brakes 1 2, hinged together, lever mechanism for lowering, raising, and spreading the same, and the extensible suspension-rod 4, connected to the car and to the brake-shoe, substantially as herein specified.

4. In combination with the compound shoe-brake 1 2, hinged together and operated by lever spreading and raising and lowering mechanisms, the suspension-rod 4, connected to the shoe by the spring and housing, whereby the oscillation of the rod 4 may take place without affecting the application of power to the brake, substantially as specified.

5. In combination with the brake-shoes 1 2, pivoted together, the extension-rod 4, formed of two sections, one connected to the brake and the other to the platform of the car, with a housing supporting a spring to form the extensible suspension-rod, substantially as specified.

6. In combination with an oscillating lever, 13, journaled upon the running-gear of the car, a track and wheel brake composed of the shoes 1 and 2, pivoted together, a toggle mechanism connecting said shoes with each other and with the oscillating lever 13, and means, substantially as described, for suspending the brake-shoes and operating devices, substantially as set forth.

7. In combination with a track and wheel brake composed of the shoes 1 and 2, pivoted together, the oscillating lever 13, journaled upon a car running-gear, a toggle mechanism connecting the shoes and oscillating lever, an extensible suspension-rod, 4, the hand-lever 15, and the connecting-rod 14, substantially as described.



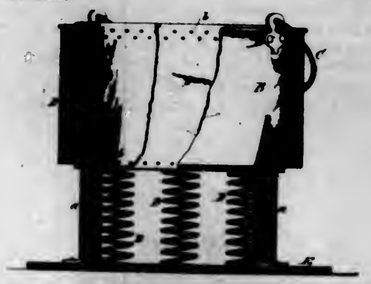
8. The combination, with two sets of track and wheel brakes suspended in front and rear of the wheel and composed of shoes 1 and 2, pivoted together, of an oscillating lever, 13, journaled on the car running-gear, toggle links or levers connecting the shoes of each set together and connecting both sets to said oscillating lever, and means for actuating said lever, substantially as described.

9. The combination of the pivotally-connected shoes 1 and 2, suspended in sets in front and rear of the car-wheels, and having bearing-surfaces conforming, respectively, to the track and wheels, oscillating levers 13, journaled on the car running-gear, links or levers 6, 7, and 9, connecting said shoes to the oscillating levers, extensible suspension-rods 4, and means for actuating the oscillating levers, substantially as described.

388,732. MACHINE FOR GRINDING HARROW-DISKS. Edward A. Sloat, La Fargeville, N. Y. Filed May 17, 1888. Serial No. 274,151. (No model.)

Claim.—1. The combination, in a device for sharpening disks, of a frame having supports and means for attaching a disk-carrying shaft thereto, side strips, E, having a series of perforations, *e*, a cutter

388,732.



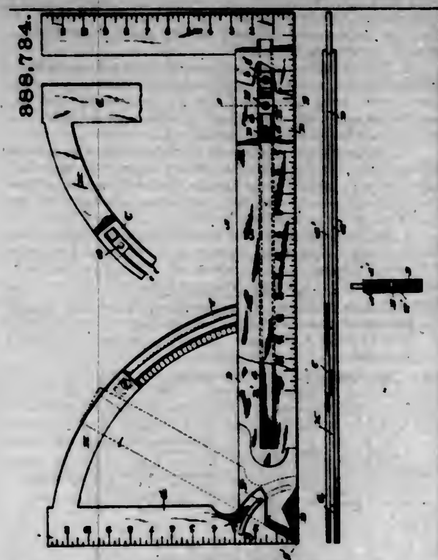
having a cross-bar which engages with the perforations *e*, and a chuck connected to the driving-shaft for rotating the disk-carrying shaft, substantially as shown, and for the purpose set forth.

2. In a device for sharpening harrow or cultivator disks, a frame having bearings for the support of the disk-carrying shaft, and mechanism for rotating said shaft, side strips, E, provided with perforations *e*, a cutter attached to a cross-bar which engages with said perforations, and a weighted lever and chain, G, connected to said lever and cutter, substantially as shown, and for the purpose set forth.

3. The combination, in a device for grinding or sharpening disks, shaft-supports attached to the main frame, so as to hold the disk-carrying shaft in its bearings, a driving-shaft provided with a chuck for engaging with one end of the disk-carrying shaft, and the cutter adjustably secured to a frame and held automatically in engagement with one of the disks by a weighted lever connected to the cutter, the parts being organized substantially as shown, and for the purpose set forth.

4. The combination, in a device for sharpening disks constructed substantially as shown, of a frame provided with perforated side pieces, E E, of a cutter having a horizontal bar, one end of said bar being screw-threaded and provided with an adjusting-nut, the cutter projecting from the opposite end of said bar, substantially as shown, and for the purpose set forth.

388,733. VESSEL FOR TRANSPORTING BREAKABLE GOODS. Lena Sloan, Wausau, Wis. Filed May 30, 1888. Serial No. 275,467. (No model.)



Claim.—A transporting-vessel comprising a casing, a bail to said casing, a support for the casing, including a base of greater diameter than the casing, and standards, and an interior vessel moving loosely within the casing, mounted on springs resting on the base, with its bottom normally below the bottom edge of the casing, and said interior vessel provided with apertures at top and bottom for tying cords, all substantially as shown and described, and for the purpose specified.

388,734. COMBINED SQUARE AND PROTRACTOR. Joseph D. Smith, Rising City, Nebr. Filed May 5, 1888. Serial No. 272,887. (No model.)

Claim.—1. The combination, in a carpenter's square having a slotted arc-shaped member, C, of the arm G, with a projecting arc-shaped member, H, adapted to be connected to the arm C by a set-screw, the lower end thereof having a slot, *g*, above its point, and a pin, F, connecting the parts to each other, substantially as shown, and for the purpose set forth.

2. The combination, in a carpenter's square, of the side pieces, A', connected to each other rigidly at one end by an angle-block, B, and near the opposite end by a rivet, a slotted L-square connected thereto so as to be longitudinally adjustable, one of the side pieces A' having a slotted arc-shaped member, C, the arm G, having a curved member, H, means for connecting the same to the member C, and a segmental slot, *g*, through which a pin, F, passes, the parts being organized substantially as shown, and for the purpose set forth.

388,735.

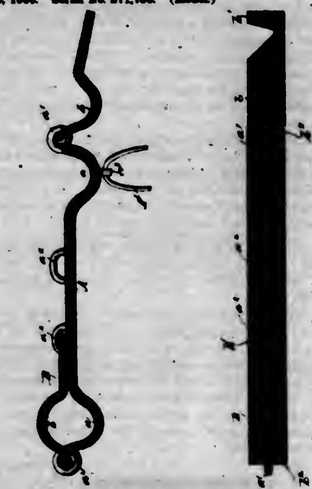
388,735. SPOKE-SOCKET. Melvin L. Smith, Batavia, N. Y. Filed Apr. 24, 1888. Serial No. 271,976. (No model.)

Claim.—The combination of the felly having a circular recess, E in its inner side, and provided with notches H in the base of said recess, the spoke having its tenon entering the felly, and the casting fitting in the recess E, having lugs G, engaging the notches H, the lugs I, adapted to be pressed into the sides of the felly, and the upwardly-projecting lips J, having concave inner faces and bearing against the opposite sides of the spoke, as specified.

388,736. STEAM BELL-RINGER. Gardner B. Snow, Buffalo, N. Y. Filed Oct. 24, 1887. Serial No. 253,193. (No model.)

Claim.—1. In a single-acting engine adapted for use as a motor for ringing bells, the combination, with the cylinder and piston, of a relief-passage communicating with the space in the cylinder at one end, an exhaust-pipe at the opposite end portion of the cylinder, an exhaust-port and a nozzle of less diameter than the exhaust-pipe, placing the said exhaust-port in communication with the exhaust-pipe to discharge the first leakage and produce a partial vacuum and withdraw the leakage around the piston, substantially as described.

2. In a single-acting engine adapted for use as a motor for ringing bells, the combination of the piston, the cylinder having a relief-passage communicating with the space above the piston, and a port for the discharge of the exhaust at the opposite end of the piston, and an exhaust-pipe communicating with the said port by a passage, *a'*, of less diameter than the exhaust-pipe to produce a partial vacuum and withdraw the leakage around the piston, substantially as described.



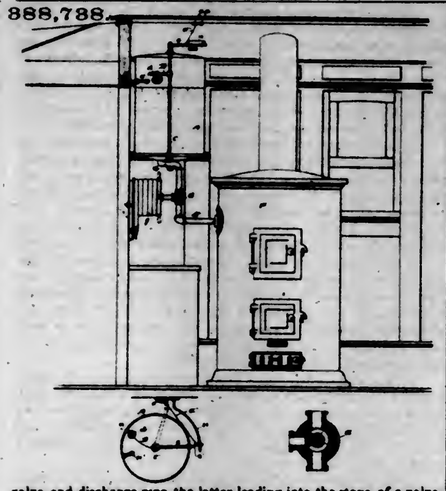
3. In a single-acting engine adapted for use as a motor for ringing bells, the combination of a passage for removing exhaust-steam from below the piston and leakage from around it, and a relief-passage communicating with the space in the cylinder above the piston, and also having a separate communication with the cylinder at an intermediate point traversed by the piston, both passages leading to a common exhaust-pipe, substantially as described.

4. In a single-acting engine adapted for ringing bells, the combination of a connecting-rod jointed to a guide-block with a grooved or scored piston, said grooves or scores being adapted to register with the relief-passage, said piston operating with the guide-block by contact only, whereby lateral pressure of the piston upon the cylinder is avoided, substantially as set forth.

5. In a single-acting engine adapted for ringing bells, the combination of the telescopic connecting-rod E F G, connected to the guide-block H by a universal joint, with a piston operated by contact with said guide-block, substantially as described.

6. In a single-acting engine adapted for ringing bells, the pin *b*, passing transversely through the piston B below its packing-ring, and thus placed wholly within the cylinder-cavity below the piston, in combination with the link D, as a means for connecting the piston B and valve V, substantially as described.

388,737. BOTTLE. Benjamin Smith, Doniphan, Nebr. Filed Apr. 20, 1888. Serial No. 271,784. (Model.)



Claim.—1. In an anti-kicking device, the combination, with the main bar, having bends, end eyes, and staples, of the end hasps attached to the eyes of the main bar and having bends and hooked ends adapted to engage the staples of the said bar, substantially as described.

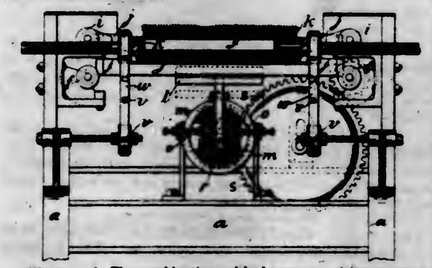
2. In an anti-kicking device, the combination, with the main bar, having bends, end eyes, and staples, of the end hasps attached to the eyes of the main bar and having bends and hooked ends adapted to engage the staples of the said bar, and the link also attached to one side of the bar, substantially as described.

388,738. FIRE-EXTINGUISHER FOR RAILWAY-CARS. Frank R. Squire, Cleveland, Ohio. Filed Apr. 16, 1887. Serial No. 235,266. (No model.)

Claim.—1. The combination, with a car-heating stove, reservoir,

388,738.

valve, and discharge-pipe, the latter leading into the stove, of a valve-stem extending through the chamber of the reservoir, a spring connected with the valve-stem inside the reservoir, a frangible vessel carried by the spring, a stop for engaging and giving tension to the spring in opening the valve, and a breaker made to engage the frangible vessel with the recoil of the spring, substantially as set forth.



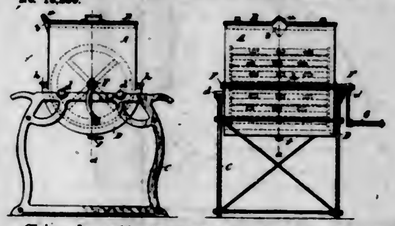
2. The combination, with stove-fire extinguisher, valve, lever, and primary and secondary cords, of a curved plate for holding the cord on the valve-lever in opening the valve, and removed at its rear end from the arc of the circle described by the lever to permit of the cord drawing off of the lever when the valve is open, substantially as set forth.

3. The combination, with a stove, a reservoir having therein a frangible vessel containing a chemical, a lever adapted, when moved, to break the frangible vessel containing a chemical and liberate the chemical, and a discharge-pipe connecting the reservoir with the stove, of a hose connected with the discharge-pipe and a three-way cock, the latter adapted to shut off the contents of the reservoir from the hose or stove, as desired.

4. The combination, with stove, reservoir, discharge-pipe, valve, and valve-stem, of a spring connected with the valve-stem, a stop for engaging and giving tension to the spring in opening the valve, a bottle or frangible vessel located inside the reservoir in position to be broken by the recoil of the spring or spring attachment when the spring is drawn off the stop, substantially as set forth.

388,739. **DEVICE FOR LOWERING THE FALLERS IN GILL-BOXES, &c.** Jos Stark, Halifax, County of York, England. Filed Mar. 17, 1888. Serial No. 267,585. (No model.) Patented in England Dec. 13, 1887, No. 17,126.

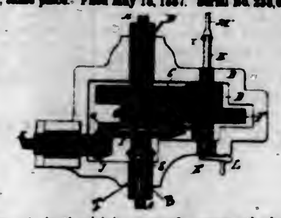
Brief.—As each faller arrives at the end of the upper set of screws it is received upon the horizontal portion of a T-headed bar and gently lowered to the other set of screws, after which the bar is raised by a cam acting against a pin in the vertical part of said bar. The sides of said vertical part are frictionally held between spring-pressed clamps, the weight of the faller being sufficient to force the bar down. The faller is also received upon lugs of two endless belts between which the bar is placed. The upper surface of the horizontal part of the bar is covered with leather.



Claim.—1. The combination, with the upper and lower screws and the fallers, of a bar which, as the fallers arrive at the end of the upper screws, receives and automatically carries each faller down to the lower screws, means for raising said bar, and frictional supports therefor, substantially as set forth.

2. The combination, with the upper and lower screws and the fallers, of the bar for carrying the fallers down from the upper to the lower screws, spring-clamps which bear frictionally on the said bar, whereby its own weight is neutralized by friction, and means for raising said bar after its descent, substantially as set forth.

3. The combination, with the upper and lower screws and the fallers, of the T-headed bar *l*, provided with a pin, *t*, the horizontal clamping-bars *n*, which bear on opposite sides of the upright of said bar *l*, their springs *o*, and the cam *p*, arranged to take under said pin *t* in lifting said bar, substantially as set forth.



4. The combination, with the screws and fallers, of the endless chains or belts *u*, arranged at the ends of the screws, and provided with properly-spaced lugs *v* to receive the fallers from the upper screws, substantially as and for the purposes set forth.

388,740. **CHURN.** Richard Stockdale, Halton, and Thomas Stockdale, Darwen, County of Lancaster, England. Filed May 5, 1888. Serial No. 272,901. (No model.) Patented in England Dec. 11, 1886, No. 16,290.

Claim.—In combination, a supporting-frame, C, having bearings, a receptacle, A, having a water-jacket, D, and discharge-opening *e*, said receptacle having also studs *d* and *d'*, arranged at different points on its opposite ends to rest in the bearings upon the frame C, whereby the said receptacle is sustained and allowed to have a tilting movement on the studs, a shaft, F, and a beater carried thereby, substantially as described.

388,741. **MOWING-MACHINE.** E. Fowler Stoddard and Arthur F. Brown, Dayton, Ohio, assignors to the Stoddard Manufacturing Company, same place. Filed May 18, 1887. Serial No. 238,097. (No model.)

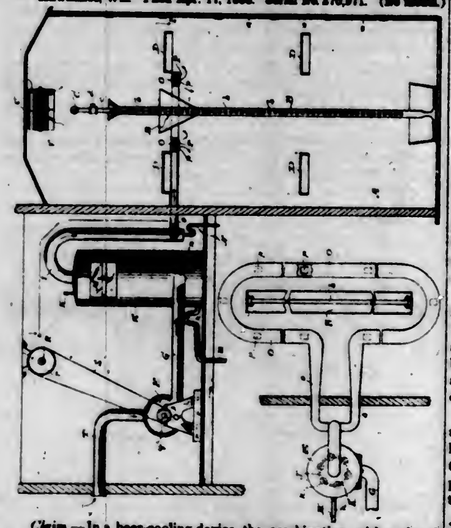
Claim.—1. In the driving-gear of a mower, the beveled pinion I, provided with a series of hollow bosses extending from the periphery of said pinion to its hub, with their bores communicating with the shaft upon which said pinion is journaled, said bores being provided at their outer ends with feeding-nozzles extending therein to form traps, substantially as described.

2. In the driving-gear of a mower, the combination, with the beveled pinion on the pitman-driving shaft, of the beveled gear-wheel meshing therewith, revolving loosely upon the axle of the machine, and provided with a hub carrying at its end opposite the pinion a bearing-washer locked thereto, which bears against a second and non-revolving bearing-washer interposed between said locked washer and beveled gear and adjustably connected to a fixed point of the frame, whereby the end-thrust is entirely borne by said washers and kept from being thrown upon other parts of the driving-gearing, substantially as described.

3. The lever P, journaled to the frame of the machine and carrying at its upper end a collar, O, encircling the hub H and provided with an adjusting-bolt, R, and the chilled washer M, locked to the collar O, in combination with the washer N, locked upon the end of the projecting hub H, which carries the driving-pinion I G, the parts constructed and arranged substantially as and for the purpose specified.

4. The ratchet-sheave V, provided on its inner side with the segmental rib *l*, in combination with the spring-projected bolt E, having a stop-shoulder, *j*, the pedal-locking dog E, and lifting-lever A', the parts constructed and arranged substantially as and for the purpose specified.

5. The spring ratchet-sheave V, provided on its inner side with the segmental rib *l*, in combination with the spring-projected bolt E, having a stop-shoulder, *j*, the pedal-locking dog E, and lifting-lever A', the parts constructed and arranged substantially as and for the purpose specified.



6. The coupling-arm G, having its upper end channeled, in combination with the extension H', provided with the ball *e*, and tongs to fit the channels of the coupling-arm, substantially as described.

7. The combination, with the main frame of a mower and its coupling-arm provided with a ball, of the box consisting of the two parts I J, separated from the frame and recessed to form a socket for the ball, the lower part of which box rests upon the main frame and is provided with a dowel to fit into a corresponding hole in the main frame, and bolts for uniting the parts, substantially as described.

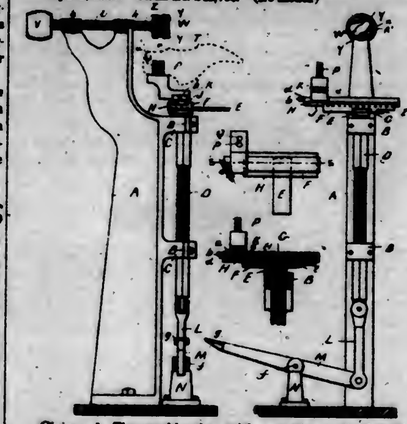
8. The combination, with the lifting-sheave provided with a segment-flange, of a wiper-rack pivoted to the main frame and separate from said sheave, a pinion engaging with said rack, and a coupling-shaft interposed between said pinion and the eccentric driving-gear shaft, substantially as described.

9. The combination and arrangement of the sheave V, with its flange *f*, the wiper-arm *f'*, wiper-rack *k'*, shell *g'*, the bearing K', with its hollow spindle *e'*, the pole L', the coupling-shaft M', with its pinion N', engaging with the rack, and the eccentric-shaft E, and driving-gearing on the eccentric and main shafts, substantially as and for the purpose specified.

388,742. **DEVICE FOR COOLING BEER.** J. Pius Thomas, Milwaukee, Wis. Filed Apr. 17, 1888. Serial No. 270,971. (No model.)

Claim.—In a beer-cooling device, the combination, with a closed chamber, of a beer-cooler and beer-supply pipe contained therein, and a wind-trunk surrounding said cooler and provided with openings, and adjustable slides for regulating the size of said openings at will, and means, substantially as described, for forcing cooled air through said wind-trunk and its openings into said closed chamber on both sides of said beer-cooler.

388,743. **SAFETY CAR-TRUCK.** Henry D. Thompson, West Swanzey, N. H., assignor of one-fourth to George W. Ryer, Brooklyn, N. Y. Filed Jan. 27, 1888. Serial No. 262,102. (No model.)

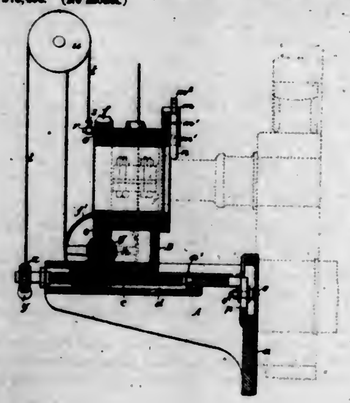


Claim.—1. The combination, with a car-truck having outer flanged wheels and intermediate flanged wheels thereon, of a railway truck having outer truck-rails and intermediate truck-rails, substantially as specified.

2. The combination, with a single truck provided with outer and intermediate truck-rails, of a car-truck the axles of which are provided with outer flanged car-wheels and intermediate flanged car-wheels of lesser diameter than the outer car-wheels, substantially as specified.

3. The combination, with a single railroad-truck having outer track-rails and intermediate track-rails of greater height than the outer rails, of a car-truck the axles of which are provided with flanged outer wheels and flanged intermediate wheels of lesser diameter than the flanged outer wheels, substantially as specified.

388,744. **ANVIL HEEL-SHOULDERING MACHINE IN THE MANUFACTURE OF LASTS.** William Thompson, Brockton, Mass. Filed Sept. 3, 1887. Serial No. 248,703. (No model.)



Claim.—1. The combination, with a cutting-tool adapted to be operated in any suitable manner, of a holder, K, for a boot or shoe last provided with two pins or studs, P Q, one pin, Q, of larger diameter than the other, said holder being arranged to be moved toward and away from said cutting-tool, for the purpose specified.

2. The combination, with a cutting-tool adapted to be operated in any suitable manner, of a holder, K, for a boot or shoe last provided with two pins or studs, P Q, one of larger diameter than the other and arranged to be adjusted on a plate or bed, H, arranged to move back and forth on a plate, F, which plate F is arranged to move back and forth on a suitable holder at right angles to the line of movement of said plate H, for the purpose specified.

3. The combination, with a cutting-tool adapted to be operated in any suitable manner, of an adjustable holder, K, for a boot or shoe last provided with two pins or studs, P Q, one of larger diameter than the other, said holder being arranged to move back and forth on a plate or bed, H, which bed H is attached to a rod or bar, D, connected to and operated by a lever or treadle, for the purpose specified.

388,745. **DEVICE FOR TURNING CRANK-PINS.** Thomas Urbahn, Berlangichut, Tambof, Russia. Filed May 20, 1888. Serial No. 273,493. (No model.)

Claim.—1. In a machine-tool for the purposes above specified, a hollow spindle or sleeve provided with a tool holder or pocket and means for rotating the said spindle or sleeve upon or about its axis and feeding or moving it longitudinally, substantially as set forth.

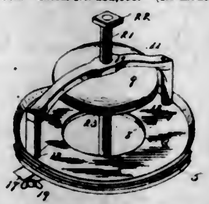
2. The combination of a bracket, A, a head-stock, B, a hollow spindle or sleeve, *c*, having a tool holder or pocket, *m*, means for rotating said spindle or sleeve, and means for feeding or moving the same longitudinally, substantially as and for the purpose set forth.

3. The combination of the bracket A, having planed surfaces *a a'* and slots a^3, the head-stock B, the screw *c* and means for intermittently rotating the same, and the movable or adjustable center *o*, substantially as and for the purpose described.

4. The combination, with the bracket A, head-stock B, hollow spindle or sleeve *c*, and worm-wheel *f*, of the screw *c* and the ratchet *x*, provided with a counter-weight and connected with the said worm-wheel by a cord or chain, *t*, substantially as and for the purposes set forth.

5. The combination, with the head-stock B and hollow spindle or sleeve *c*, of the worm-wheel *f*, the worm *g*, the spindle *h*, and means for rotating the same, substantially as and for the purpose specified.

6. The hollow spindle *c*, provided with a tool holder or pocket, *m*, and screws m' m^2, substantially as described.

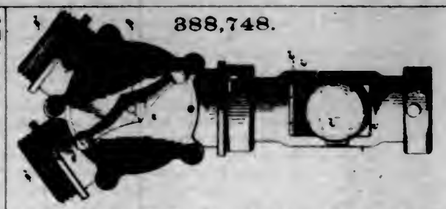


388,746. ELECTRODE FOR STORAGE-BATTERIES. Jean T. Van Gheyel, New York, N. Y. Filed Nov. 10, 1887. Serial No. 254,770. (No model.)

Claim.—1. In an element for storage-batteries, the combination of the base-plate of metal having low electrical resistance and the covering of lead or lead alloy integral throughout, united at openings through the base-plate from opposite sides thereof, and provided with the series of receptacles at opposite sides containing active material, substantially as set forth.

2. In an element for storage-batteries, the combination of the open-work or perforated base-plate of metal having low electrical resistance and the covering of lead or lead alloy integral throughout, united from opposite sides of the base-plate at openings therethrough, provided with the series of receptacles at opposite sides containing active material, and having the thickened rim, substantially as set forth.

388,747. WELL-BUCKET. John L. Van Hook, Round Rock, Tex. Filed Oct. 11, 1887. Serial No. 252,035. (No model.)

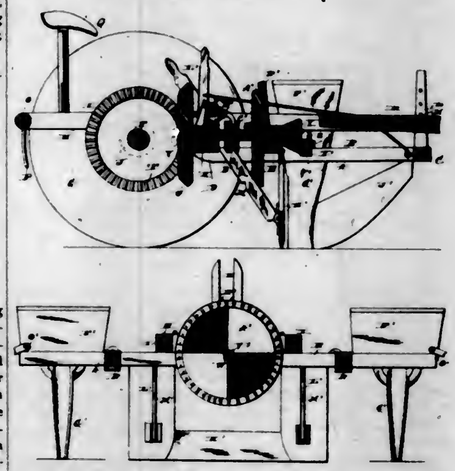


Claim.—The combination of the cylinder or body, the flaring bottom rim or hoop provided on its inner surface with suitable screw-threads, and also having on its lower peripheral portion diametrically-opposite lugs or projections, the perforated bottom piece provided with suitable threads upon its peripheral portion, the upper curved or arched guide-arm having a central perforation and provided with screw-threaded ends having shoulders bearing against the upper side of the bottom of the bucket, said ends also passing through perforations in the rim of the bottom, the lower curved or arched guide-arm having central perforation and provided with laterally-extending perforated ends extending outwardly a greater distance than the periphery of the bottom of the bucket and adapted to bear against the lugs upon said bottom, nuts adapted to engage the screw-threaded ends of said upper guide-arm, the valve or disk having a central perforation or hole, and the valve-rod passing through said central perforation and rigidly secured thereto.

388,748. HOSE-CONNECTION. Morton W. Webb, Charleston, S. C. Filed Aug. 6, 1887. Serial No. 246,327. (No model.)

Claim.—1. The combination, with a cylindrical casing having three or more outlets, of a valve revolubly supported in the center of said casing and adapted to close any one of the openings, and a handle for locking said valve over or away from the said openings, substantially as set forth.

2. The combination, with a cylindrical casing having three or more outlets and a removable cap having a series of sockets therein, of a V-shaped valve revolubly supported in the center of said casing



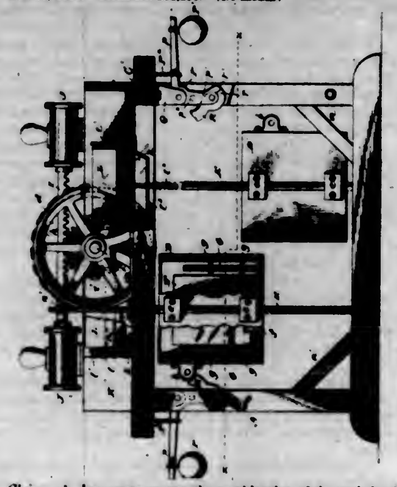
388,748.

and adapted to close any one of the openings, a handle connected with the valve, and a rod or pin in the handle adapted to enter one of the sockets in the removable cap, whereby the valve is locked in position, substantially as set forth.

3. The combination, with a cylindrical casing having three or more outlets, a valve revolubly supported in the center of said casing and adapted to close any one of the openings, and a handle connected with the valve, said handle provided with means whereby the valve is locked, of a pipe connected to said casing and provided with an outlet, a hinged valve for closing said outlet, a spiral spring resting on said valve, and a set-screw for regulating the tension of said spring, substantially as set forth.

4. The combination, with a cylindrical casing having three or more outlets, a removable cap having a series of sockets therein, a V-shaped valve revolubly supported in the center of said casing and adapted to close any one of said openings, and a handle connected with the valve, said handle provided with a pin or similar means adapted to enter the socket in the cap, whereby the valve is locked, of a pipe connected to said casing and provided with an outlet, a hinged valve for closing said outlet, a spiral spring resting on said valve, and a set-screw for regulating the tension of the spring, substantially as set forth.

388,749. CHECK-ROW CORN-PLANTER. Isaac F. Wilson, Penns, Bobr., assignor of one-half to Christopher Wog, same place. Filed Apr. 2, 1888. Serial No. 269,346. (No model.)



Claim.—1. In a check-row corn-planter, the combination, with the frame and dropper attachment, of an indicator-wheel divided into sections, each of which sections is distinguishable from the adjoining sections and provided with a complete set or series of indicator-points and a pointer.

2. An indicator for seed-planters, comprising a wheel having a beveled periphery upon which are arranged a number of series of inverted numerals, and the inner face of this wheel is provided with a series of differently-colored quadrants, in combination with a pointer secured to the frame of the planter and projecting with its hooked end over the beveled periphery of the wheel.

3. The combination, with the main and top frame secured to the axle of the drive-wheels, of the intermediate gearing, the indicator-wheel, substantially as described, the seed-boxes, the reciprocating seed-slides, the swinging depressor, the notched handles secured to the depressors, and the keepers for the handles.

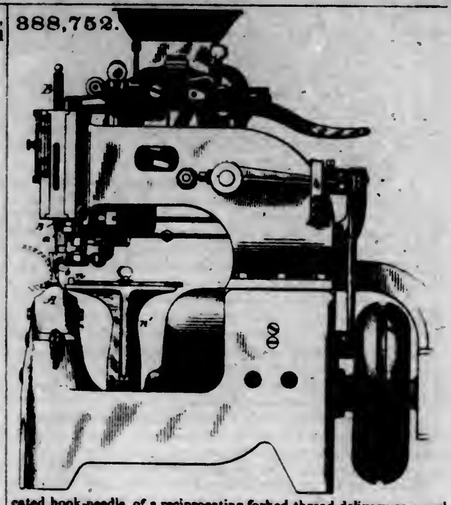
388,750. WATER-MOTOR. James Wilson, New Preston, Pa., assignor of one-half to James Henry Cunningham, same place. Filed Jan. 21, 1888. Serial No. 261,530. (No model.)

Claim.—1. In a water-motor, the combination of the tank having openings in its bottom, the valves extending about the full height of the tank and having the edges parallel and the sides slightly converging, the stems depending from the valves, the two carriers connected together and adapted to reciprocate alternately in a vertical direction and strike against the said stems, and the two weighted levers adapted to alternately engage with the carriers and hold them while the one is loading and the other is unloading, substantially as and for the purpose specified.

2. The combination, with the counterbalancing carrier or bucket and the valves F, of the brackets O, the rods N, and the adjustable stops *n'*, substantially as and for the purpose described.

388,751. SOLE-EDGE BURNISHER. Christopher Amasken, Boston, Mass. Filed May 31, 1888. Serial No. 275,633. (No model.)

Claim.—In a sole-edge-burnishing machine, the combination of the head-block B, having springs E E and pivot D, with the self-adjusting burnishing-tool C, pivoted to the head-block B, and having lips projecting from its burnishing-face C and adapted to move longitudinally on the edge of the sole, all operating together substantially as described, and for the purpose set forth.



388,752. WAX-THREAD SEWING-MACHINE FOR STITCHING UPPERS TO SOLES. George Ambors, Jr., Lincoln, assignor to the Campbell Machine Company, Pawtucket, R. I. Filed Oct. 19, 1887. Serial No. 252,817. (No model.)

Claim.—1. The combination, with a hook-needle, of a forked thread-delivering arm located at and restricted in its movements to the rear side of said needle and its path, substantially as described, whereby free space is afforded at and closely adjacent to the front or opposite side of said needle and path for the presence of materials in the process of stitching, for obviating the liability of their displacement heretofore incident to the contact therewith of a thread-delivering arm.

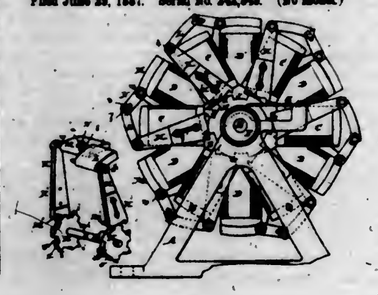
2. The combination, with a longitudinally and axially recipro-

388,752.

cated hook-needle, of a reciprocating forked thread-delivery arm and a vibrating thread-controlling arm, substantially as described, whereby when said needle is elevated and its hook presented at the rear side of the needle-path thread will be delivered to the needle-hook by said arm without materially projecting any portion of said arm beyond the path of the needle, and the thread properly controlled while carried by the delivery-arm to said needle, and also during the rotative movement of the latter in carrying downward a loop of thread.

3. The combination of a hook-needle with a thread-delivering arm provided with a thread-eye, and also with a notched finger, and having an intervening space between said eye and finger for occupation by the needle during the delivery of thread to its hook, substantially as described.

4. The thread-delivering arm having a thread-eye, a slotted finger, and a guard on top of said finger and extending toward said eye, substantially as described.



5. The combination, with the cylindrical needle-bar and the slotted guide-bearing, in which said bar is longitudinally and axially reciprocated, of a semi-cylindrical cross-head axially coupled to said bar and fitted to said bearings and to the slot therein, substantially as described.

6. The combination, with a longitudinally and axially reciprocated needle-bar having a cross-head thereon, in which said bar can rotate, of a guide-bearing to which said bar and cross-head are mounted, and bearing-surfaces on said bar above and below said cross-head, substantially as described.

7. The combination of a needle-bar having a spiral guide-face thereon, a guide engaging with said face, a screw for forcing said guide against said face, and a clamp-screw for confining said guide in position, substantially as described.

8. The combination of the needle-bar provided with a V-shaped spiral guide-groove, a cylindrical guide-bearing in which said bar is reciprocated longitudinally and axially, a stud or pin V-shaped at its end occupying said spiral groove, a set-screw for forcing said stud longitudinally, and a clamp-screw for confining said stud against rotation, substantially as described.

388,753. ELECTRIC MOTOR. John Batley, Philadelphia, Pa. Filed June 29, 1887. Serial No. 243,043. (No model.)

Claim.—1. The combination of a series of electro-magnets arranged in a circle, a motor-shaft, a friction-wheel secured to the motor-shaft, a series of friction-levers operating on the friction-wheel, and a series of armatures to actuate said friction-levers.

2. The combination of a series of electro-magnets arranged in a circle, a motor-shaft, a friction-wheel secured to the motor-shaft, a series of friction-levers operating on the friction-wheel, and a series of armatures to actuate said friction-levers, a source of electric energy, separate circuits for each of said magnets, and suitable switches to cut out of circuit one or more of said electro-magnets.

3. The combination of a series of electro-magnets arranged in a circle, a motor-shaft, a friction-wheel secured to the motor-shaft, a series of friction-levers operating on the friction-wheel, a series of armatures to actuate said friction-levers, a separate battery to each magnet, circuits connecting each battery with its electro-magnet, a commutator to throw said magnets into or out of circuit, and separate switches to cut out one or more of said batteries.

4. The combination of a series of electro-magnets arranged in a circle, a motor-shaft, a friction-wheel secured to the motor-shaft, a series of friction-levers operating on the friction-wheel, a series of armatures to actuate said friction-levers, a source of electric energy, separate circuits for each of said magnets, suitable switches to cut out of circuit one or more of said electro-magnets, and a commutator to put said magnets into or out of circuit.

5. The combination of two series of electro-magnets arranged in circles, a motor-shaft having two friction-wheels, two sets of armatures, one for each set of magnets, friction-levers actuated thereby and operating in connection with the friction-wheels to rotate the shaft, a source of electric energy, separate circuits for each series of electro-magnets, and commutators to alternately put each of said series of electro-magnets into and out of circuit.

6. The combination of two series of electro-magnets arranged in circles, a motor-shaft having two friction-wheels, two sets of armatures, one for each set of magnets, connections between the armatures of the two series, so that when one is attracted the other is raised, friction-levers actuated thereby and operating in connection with the friction-wheels to rotate the shaft, a source of electric energy, separate circuits for each series of electro-magnets, and commutators to alternately put each of said series of electro-magnets into and out of circuit.

7. The combination of two series of electro-magnets arranged in circles, a motor-shaft having two friction-wheels, two sets of armatures, one for each set of magnets, friction-levers actuated thereby and operating in connection with the friction-wheels to rotate the shaft, a source of electric energy, separate circuits for each series of electro-magnets, commutators to alternately put each of said series of electro-magnets into and out of circuit, and switches to cut out of circuit one or more of the electro-magnets of each series.

8. The combination of a series of electro-magnets arranged in a circle, a motor-shaft, a friction-wheel secured to the motor-shaft, a series of friction-levers operating on the friction-wheel, a series of armatures to actuate said friction-levers, a source of electric energy, separate circuits for each of said magnets, suitable switches to cut out of circuit one or more of said electro-magnets, and means, substantially as set forth, to actuate said friction-levers when their operating electro-magnets are cut out of circuit.

9. The combination of two series of electro-magnets arranged in circles, a motor-shaft having two friction-wheels, two sets of armatures, one for each set of magnets, friction-levers actuated thereby and operating in connection with the friction-wheels to rotate the shaft, a source of electric energy, separate circuits for each series of electro-magnets, commutators to alternately put each of said series of electro-magnets into and out of circuit, and means, substantially as set forth, to actuate said friction-levers when their operating electro-magnets are cut out of circuit.

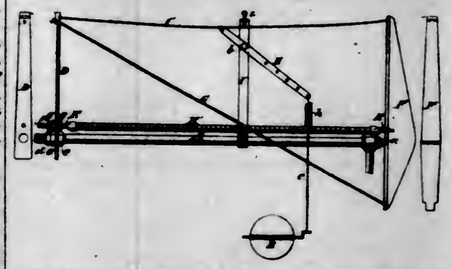
10. The combination of two series of electro-magnets arranged in circles, a motor-shaft having two friction-wheels, two sets of armatures, one for each set of magnets, connections between the armatures of the two series, so that when one is attracted the other is raised, friction-levers actuated thereby and operating in connection with the friction-wheels to rotate the shaft, a source of electric energy, separate circuits for each series of electro-magnets, commutators to alternately put each of said series of electro-magnets into and out of circuit, switches to cut out of circuit one or more of the electro-magnets of each series, and means, substantially as set forth, to actuate said friction-levers when their operating electro-magnets are cut out of circuit.

11. The combination of a motor-shaft, a notched friction-wheel secured thereto and electro-magnets, a pivoted armature therefor, and a pivoted friction-lever actuated thereby and having its operating-face curved to work in contact with the raised portions of the friction-wheel.

12. The combination of a motor-shaft, a notched friction-wheel secured thereto, an electro-magnet, a pivoted armature therefor, a pivoted friction-lever actuated thereby and having its operating-face curved to work in contact with the raised portions of the friction-wheel, and stops, substantially as set forth, to prevent the friction-wheel revolving faster than required by the vibrations of the friction-lever.

13. The combination of a series of electro-magnets arranged in a circle, a motor-shaft, a notched friction-wheel secured to the motor-shaft, a series of levers to act upon said friction-wheel by rolling contact and having projections which work in the notches of the friction-wheel to positively thrust it at the last portion of the vibration of said levers, and a series of armatures to vibrate said friction-levers.

14. The combination of a series of electro-magnets arranged in a circle, a motor-shaft, a notched friction-wheel secured to the motor-shaft, a series of levers to act upon said friction-wheel by rolling contact, and having projections which work in the notches of the friction-wheel to positively thrust it at the last portion of the vibration of said levers, and a series of armatures to vibrate said friction-levers, and adjusting devices to adjust the contact portion of the friction-levers to or from the friction-roller.



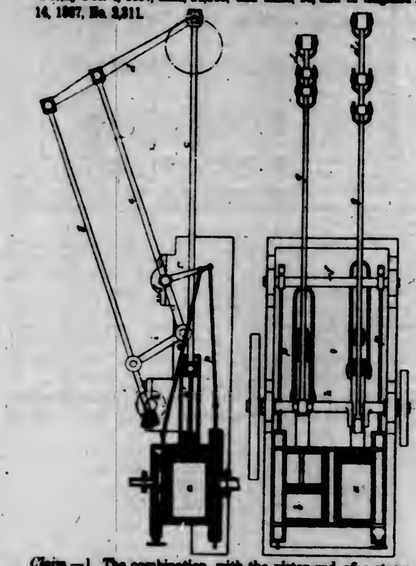
15. The combination of a series of electro-magnets arranged in a circle, a motor-shaft, a friction-wheel secured to the motor-shaft, a series of friction-levers operating on the friction-wheel, a series of armatures to actuate said friction-levers, and adjusting devices to adjust the contact-surface of the friction-levers to or from the friction-wheel.

16. In an electromotor, the combination of a series of stationary actuating electro-magnets, a series of pivoted vibrating armatures therefor, a separate source of electrical energy to each of said magnets, and switches to cut out one or more of said electro-magnets from its source of energy.

17. In an electromotor, the combination of two series of actuating electro-magnets, a series of pivoted vibrating armatures therefor, a separate source of electrical energy to each electro-magnet, and switches for simultaneously cutting out of circuit one or more corresponding electro-magnets from each series.

18. In an electromotor, the combination of a series of radially-arranged actuating electro-magnets, a separate source of electrical energy for each of said magnets, a motor-shaft, a circuit-breaker on said shaft, and separate circuits controlled by said circuit-breaker to simultaneously make or break all of the circuits, so that all of the magnets are simultaneously energized or demagnetized.

388,754. THERMOTIC VALVE-CONTROLLER. GEORGE W. BLAKE, New York, N. Y., assignor to Butzler & Blake, same place. Filed May 1, 1888. Serial No. 272,672. (No model.)

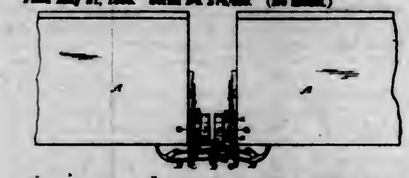


Claim.—1. The combination, with a steam or hot-water pipe and a damper or valve, of a support connected with said pipe, a rigid bar having one end connected with said support, a lever having its fulcrum at the other end of said bar and bearing against said pipe, a flexible bar applied lengthwise between said support and lever, and a connection between said flexible bar and the damper or valve, substantially as herein described.

2. The combination, with a steam or hot-water pipe and a damper or valve, of a flexible bar connected with the latter, two supports for the ends of said flexible bar, connected with the pipe at distant points, one of said supports being a lever, against which said pipe expands lengthwise, and a rod or link forming a direct connection between said lever and the other support for the flexible bar, the connection of said rod or link with the lever being on the opposite side of its fulcrum to that on which its supports the flexible bar, substantially as herein described.

3. The combination, with a steam or hot-water pipe and a damper or valve, of a flexible arm connected with said pipe, a rigid bar having one end connected with said arm, a lever having its fulcrum at the other end of said bar and bearing against said pipe, a flexible bar applied lengthwise between one arm of the said lever and the said flexible arm, a connection between the opposite arm of said lever and the said flexible bar, and a connection between said lever and the damper or valve, substantially as herein described.

4. The combination, with a steam or hot-water pipe and a damper or valve, a support connected with said pipe, a rigid bar having one end connected with said support, a lever having its fulcrum at the other end of said bar and bearing against said pipe, and two flexible bars, the fulcra of which is in opposite directions, applied lengthwise between said lever and support, of a lever fulcrumed on one of said flexible bars, a connection between said lever and the other of said flexible bars, and a connection between said lever and the damper or valve, substantially as and for the purpose herein described.



388,755. STEAM-ENGINE. JEAN BERNARD, Langon, Gironde, France. Filed Feb. 17, 1888. Serial No. 264,371. (No model.) Patented in France Dec. 14, 1885, No. 172,749; in Belgium Jan. 28, 1887, No. 76,131; in Austria-Hungary Jan. 31, 1887, No. 8,691 and No. 34,381; in Italy Feb. 4, 1887, XXI, 31,188, and XLII, 16, and in England Feb. 14, 1887, No. 2,311.

Claim.—1. The combination, with the piston-rod of a steam-engine, of the pitman *c*, rod *d*, lever *e*, oscillating on fulcrum *f*, and rod *g*, coupled to a crank in the driving-shaft, and rod *i*, connecting said rod *g* and lever *e*, substantially as and for the purposes set forth.

2. The combination, with the piston-rod of a steam-engine, of the pitman *c*, rod *d*, lever *e*, oscillating on fulcrum *f*, and rod *g*, coupled to a crank in the driving-shaft, and rod *i*, connecting rod *g* and lever *e*, a rod, *r*, oscillating on fulcrum *f*, and valve-rods *o* and *p*, coupled to rod *r*, substantially as and for the purposes set forth.

388,756. CAR-COUPLING. ARTHUR W. BURNHAM, Ballston, N. Y. Filed May 31, 1888. Serial No. 274,469. (No model.)

Claim.—1. The combination of a jaw, B, pivoted at its rear end to a suitable support, with the jaw D, pivoted at its rear end to the jaw B, a loose connection for uniting the jaws, and a lever connected to the jaws for raising or lowering them together or adjusting the upper jaw independently of the lower one, substantially as shown.

2. The combination of the pivoted head B, the jaw D, pivoted thereto, the coupling-chains F G, the levers H, and the ratchets I, substantially as set forth.

388,757. FURNACE FOR BAKING SHOUTED-LIGHT CARBONS. JOHN BURNS, Rochester, N. Y., assignor of one-half to Roland W. Fredricks, Lost Haven, Pa. Filed Apr. 4, 1887. Serial No. 233,993. (No model.)

Claim.—1. The combination, in a furnace, of a series of vertical retorts having beveled upper ends, with the key-blocks R and beveled blocks R' R², and the bricks and masonry constituting the top, whereby the same is keyed and supported, substantially as set forth.

2. The combination, in a furnace, of the vertical retorts beveled at their lower ends and setting in annular beveled recesses in the floor of the combustion-chamber, substantially as specified.

3. The combination, in a furnace, as described, of the vertical retorts beveled at their lower ends and setting in annular beveled recesses and beveled at their upper ends, substantially as and for the purposes set forth.

4. The combination, in a furnace, of the vertical retorts beveled at their ends and setting in annular grooved recesses and provided with covers and having communication with the combustion-chamber extending from the fire-box to the rear of the furnace, of the open-mouthed pots for holding the carbons, whereby the pots can be surrounded with sand at the sides and top, and likewise the interstices between the carbons in the pot be filled with the sand and the gases from the carbon escape from the open-mouthed pots into the combustion-chamber at a point above the pots, substantially as described.

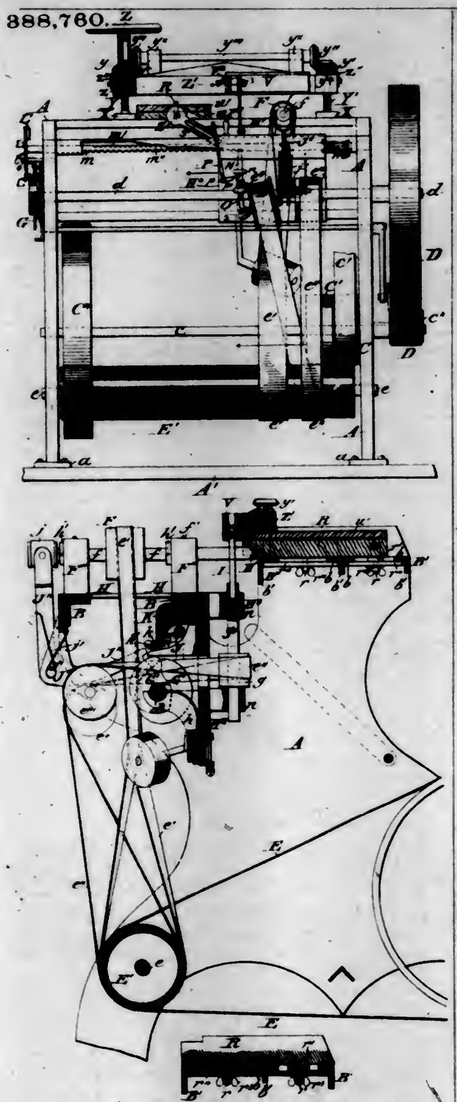
5. The combination, in a furnace, of the vertical retorts beveled at top and bottom, the flat roof supported thereby, the gas-conducting pipes leading from the retorts to the combustion-chamber, and the return-flues leading to the smoke-stack, and the bands, whereby the parts are bound together, the whole arranged to operate substantially in the manner specified.

388,758. NECK-YOKE RING. RAMON K. BURT, Madison, Kans., assignor of one-half to Albert J. Gustin, Lincoln, Nebr. Filed Mar. 15, 1888. Serial No. 267,202. (No model.)

Claim.—A neck-yoke ring having upright bars *b*, with cross-bar *b*, the bolt *c*, provided with roller *d*, inclosed between the bars *b b*, and said roller having on each side thereof spaces K *f*, as and for the purpose set forth.

388,759. INCRUSTATION-PREVENTIVE. DUNCAN H. CAMERON, Woodville, Ontario, Canada, assignor of one-half to David Annis, same place. Filed June 26, 1888. Serial No. 278,311. (No specimens.) Patented in Canada Sept. 17, 1885, No. 32,479.

Claim.—A boiler-cleansing compound of a decoction of five parts, or thereabout, of the leaves and bark of cedar; two parts, or thereabout, of the leaves and bark of tamarack, and one part, or thereabout, of the leaves and bark of each hemlock, oak, and sumac, said decoction produced by steaming the ingredients in a closed vessel and then decanting the liquid and using the same in the proportions specified, substantially as set forth.



388,760. DOVETAILING-MACHINE. NATHAN S. CLEMENT, Northampton, Mass., assignor to William B. Hale, trustee. Filed Nov. 21, 1887. Serial No. 255,513. (No model.)

Claim.—1. The combination of the horizontal reciprocating hollow auger-bits H' on carriage H, the upright auger-bits I and I', and mallop-cutter J' on vertical reciprocating carriage H², with the adjustable gage R and end gages. S and T, constructed and operating substantially as and for the purpose described.

2. The adjustable gage R, against which one edge of the stock rests, having screw-bolts *r*, depending from its lower edge, pins *r'* on the under side of the ribs *b* of the bed B' and through which the bolts *r* go, thumb-nuts *r²*, guide-head P', integral with the gage, in combination with the ribs *b* and webs *b'* of the bed, substantially as and for the purpose described.

3. The combination of the revolving cam G, cam-plate L, having the incline L' thereon, and fixed to rotative feed-rod *m*, having feed-notches, with a spring-holding dog, N, attached to part H² of carriage H, as and for the purpose described.

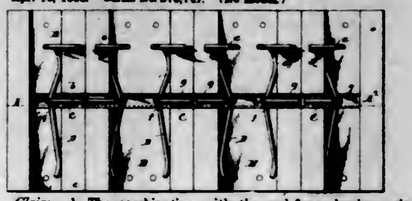
388,760.

4. The combination of the cam-shaft *d*, cam G, reversible cam-plate L, having the inclines L′ and L″ on its inside face and fixed to the rotative feed-rod *m*, having opposite notches, *m*′ and *m*″, differing in their distance apart, spring-holding dog N, secured to the part H⁴ of carriage H, with the upright reciprocating carriage H‴, carrying the auger-bits I I′ and scallop-cutter J′, substantially as described.

5. The combination of the hand-lever P, pivoted to H⁴ at *p*, and having a right-angled lifter, *p*′, and dog N, with the carriage H, having hand-hold P′ thereon, whereby the carriage is free to be reciprocated back to its first position, substantially as described.

6. The external eccentric-bushings F′, having notches A′ therein, bearing F‴, having holding-screws *f*′, in combination with the hollow auger-shaft *f*, substantially as and for the purpose described.

7. The combination of the revolving cam G″, pivoted and bent lever J″, bracket K, having removable spring-stop *k*′, lever J‴, and sleeve *j*, with the shaft *f* and auger H′, substantially as and for the purpose described.



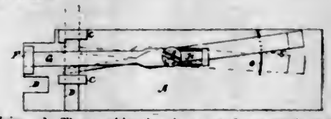
8. The cutting-block V, having holes V′ and V″ and the circular scallops v′ v″, and notches v‴ and v⁴, arranged to slide on the clamping-bar Z′, in combination with the reciprocating carriage H, having holding-dog v²⁰, pivoted thereto, substantially as and for the purpose described.

9. The revolving cam-shaft *d*, having longitudinal groove 2, cam G′, key 1, and lifter J, in combination with carriage H‴, carrying auger-bits I and I′ and scallop-cutter J′, substantially as described.

10. The adjustable gage S, having screw-bolts *s*², with the head T, part circle disk *s*′, rotatable and adjustable on bolt *s*² and held fast to gage S by nut *t*, as described.

11. The transverse reciprocating carriage H, in combination with the vertical reciprocating carriage H‴, which is attached to, reciprocates in, and carried by the carriage H, substantially as described.

388,761. **BEE-HIVE.** Thomas M. Cobb, Grand Rapids, Mich. Filed Apr. 16, 1888. Serial No. 270,741. (No model.)

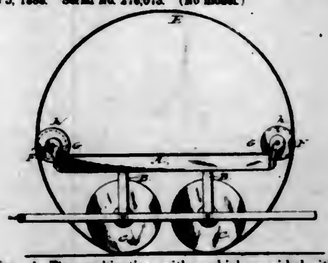


Claim.—1. The combination, with the end frame having a slot, as described, of the adjoining frame provided with a hook, as shown, and the keeper having a cam-surface engaging said hook, substantially as described.

2. The combination, with the frames formed with staples or hooks, of the end frames formed with a flange having a slot and channel, as described, and the keeper formed with cam-surface engaging said hook and seated in said channel, substantially as described.

3. The combination, with the side A³ of the surplus-honey chamber having a flange formed with channel *d* and slot *b*, of the sections *a*′, provided with staples or hooks, as shown, the plates B, formed with slots and channels, and the keepers formed of wire bent to form the cam-surface *f*, substantially as and for the purpose specified.

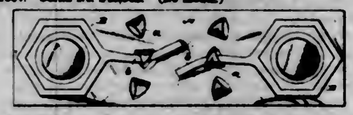
388,762. **SASH-FASTENER.** William P. Coldren, Philadelphia, Pa. Filed Dec. 17, 1885. Renewed Feb. 24, 1888. Serial No. 265,161. (No model.)



Claim.—1. The combination, in a sash-fastener adapted to be attached to the lower sash of a window, of a bolt adapted to engage with the window-casing, a bolt adapted to engage with the upper sash, and a lever or handle engaging with both bolts and adapted to operate either of them without moving the other, substantially as and for the purpose set forth.

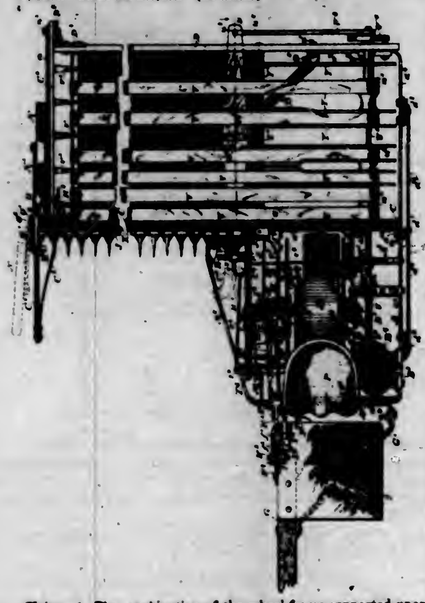
2. The combination of bolt G, handle M, having transverse slots Q R, and projection O, adapted to hold the bolt either open or closed, substantially as and for the purpose set forth.

3. The combination of bolt D, lever M, and stop S, adapted to hold the bolt either open or closed, substantially as and for the purpose set forth.



388,768. **ROAD-VEHICLE.** Milton M. Cosner, Linneus, Mo. Filed June 5, 1888. Serial No. 276,073. (No model.)

Claim.—1. The combination, with a vehicle provided with rollers serving the purpose of wheels, of an elastic cylinder serving as a flat bearing for said wheels as it bears upon an ordinary road, substantially as set forth.



2. The combination, with a wheel-vehicle and the elastic cylinder described, of anti-friction rollers provided with guide-flanges on their ends to bear against the edge of the said elastic cylinder, as and for the purpose set forth.

388,764. **NUT-LOCK.** Orrees B. Cosee, Salem, Ohio. Filed Aug. 6, 1887. Serial No. 246,262. (No model.)

Claim.—The combination, in a nut-lock, of the plate having the series of locking-lugs arranged as shown and described, and the locking device adapted to embrace a nut upon a bolt, and having the curved arm adapted to be secured by the said locking-lugs on the flat plate, substantially as specified.

388,765. **HARVESTER.** John S. Davis, Cleveland, Ohio, assignor to Adlon H. Sumner, same place. Filed Mar. 7, 1885. Renewed July 5, 1887. Serial No. 243,446. (No model.)

Claim.—1. The combination of the wheel-frame supported upon the axle of the driving-wheel, and the tongue pivoted to a bracket on the front of the frame, one of the pivot-lugs of said bracket terminating at its front end in a segmental gear-rack, with a rocking lever mounted on the tongue and provided with a segmental gear meshing into the rack on the frame-bracket and a locking-detent taking into a notched rack secured on the tongue, and a driver's seat supported by a standard fulcrumed on the main axle, and which, extending to the rear thereof, engages fixed points on the wheel-frame, substantially as hereinbefore set forth.

2. The combination of the main frame supported by and vertically adjustable upon the axle of a driving-wheel, a ratchet-standard secured to the frame, a spring-pawl pivoted upon the axle and engaging the ratchet, a sliding bolt on the foot-board, and a link-rod connecting the bolt and pawl, substantially as hereinbefore set forth.

3. The combination of the main frame of a harvester, supported upon the axle of the driving-wheel and vertically adjustable thereon, with a lever fulcrumed upon the axle and connected at one end to the frame and adapted at its other end to receive the weight of the driver, which tends to lift the frame and assist in the operation of vertically adjusting it, substantially as hereinbefore set forth.

4. The combination of the main frame of a harvester, supported upon the axle of the driving-wheel and vertically adjustable thereon, with a driver's seat mounted upon one end of the seat-standard fulcrumed upon the axle, the other end being connected to the frame, substantially as and for the purpose hereinbefore set forth.

5. The combination of the main frame of a harvester, supported upon the axle of a driving-wheel and connected at its rear to the outer front corner of a grain-platform, with a driver's seat located in front of the driving-wheel, and a seat-standard fulcrumed upon the axle and connected at its rear end to the main frame in rear of the axle, substantially as and for the purpose hereinbefore set forth.

6. The combination of a main frame, supported upon the axle of a driving-wheel, with a seat-supporting standard fulcrumed upon the axle and connected at its lower end to the frame, and the upper part vertically adjustable independently of the frame, substantially as hereinbefore set forth.

7. A seat-supporting standard fulcrumed upon the axle of the driving-wheel and connected at its lower end to the frame, the standard being composed of two parts united by a pivot, one part being adjustable relatively to the other, with means for holding it in its adjusted position, substantially as hereinbefore set forth.

8. The combination of a main frame supported upon the axle of a driving-wheel, a driver's seat located immediately over the front of the wheel, and a bifurcated seat-standard pivoted upon the axle at each side of the wheel and connected at its lower ends to the frame, substantially as hereinbefore set forth.

9. A sectional seat-standard the lower part or section of which is pivoted upon the axle and terminates above it in a segmental ratchet, the upper part which carries the seat being pivoted to the lower one at a point above the axle and provided with a pawl which engages the ratchet, and means for holding it out of engagement therewith, substantially as hereinbefore set forth.

10. The combination of a main frame supported by and vertically adjustable upon the axle of a driving-wheel, and a projection or resistance-point on the frame with a seat-standard fulcrumed on the axle and curved at its lower end, which bears against the projection or resistance-point, substantially as and for the purpose hereinbefore set forth.

11. The combination of a segmental ratchet-casting pivoted upon the axle of the driving-wheel and having a projecting lug, to which the lower end or section of the seat-standard is rigidly fastened, with the upper section of the standard pivoted to the casting and provided with a pawl which engages the ratchet, substantially as hereinbefore set forth.

12. A bifurcated seat-standard each member of which is made in two sections, the lower sections being pivoted upon the axle of the driving-wheel and provided with ratchets at their upper ends, the upper sections pivoted to the lower ones and adjustable thereon, and carrying pawls which take into the ratchets, a rock-shaft pivoted between the upper sections, depending arms on the rock-shaft, link-rods connecting the arms to the pawls, and a finger-lever secured to the rock-shaft and extending forward under the seat, substantially as hereinbefore set forth.

13. The combination of a main frame supported upon the axle of the driving-wheel with a seat-standard fulcrumed upon the axle, its lower curved end passing through a stirrup secured to the main frame and bearing against the roller in the stirrup, substantially as and for the purpose hereinbefore set forth.

14. A resistance block or stirrup for the seat-lever of a harvester, consisting of the base-plate having studs projecting from its ends, a roller mounted upon one of the studs, and a guard-plate secured against the ends of the studs, substantially as hereinbefore set forth.

15. The combination of the axle of a driving-wheel, means for supporting and adjusting the main frame thereon, a winding-drum which controls the adjustment of the grain end of the platform free to revolve on the axle, a lever to revolve the drum, and a sliding clutch to lock the drum to the axle, substantially as hereinbefore set forth.

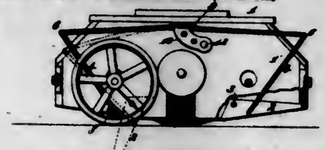
16. The combination of a winding-drum free to revolve on the axle, a lever to rotate the drum, a sliding clutch to lock the drum to the axle, a lever to operate the clutch pivoted to the drum-lever, and a spring tending to keep the clutches into locking engagement, substantially as hereinbefore set forth.

17. The combination of the main frame of a harvester and a grain-platform attached thereto with mechanism, substantially as described, whereby the driver in his seat and with one hand by means of a single lever and the clutch-shifter carried thereby may effect the vertical adjustment of the main frame and the grain end of the platform on their supports simultaneously, or he may adjust the platform end alone, substantially as hereinbefore set forth.

388,766. **VALVE.** Alfred D'Lamot, New York, N. Y., assignor of one-half to James K. Prothingham and Herman W. Winans, same place. Filed June 21, 1888. Serial No. 277,294. (No model.)

Claim.—The combination, with the wall W, of a force-pump, the valve-seat A, secured therein, and the valve-stem I, secured in said

seat, as specified, of the gum packing B, interposed between the said seat A and the valve C, the valve C, working upon said stem I and said seat A, and carrying the said packing B, the gum bush P within said valve C and around said stem I, the ring G, holding said bush in place in said valve, the screws S, securing said ring G in proper position, the washer V, and the nut R, holding said washer upon the said valve-stem I, to limit the upward motion of said valve, all substantially as and for the purpose set forth.

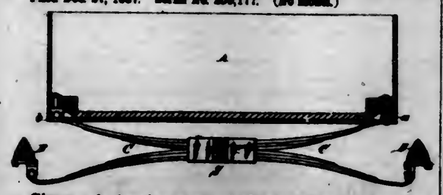


388,767. OIL-CUP. BENJAMIN J. DOWD, Somerville, assignor to the Star Brass Manufacturing Company, Boston, Mass. Filed Apr. 2, 1888. Serial No. 269,264. (No model.)

Claim.—1. The cup having a body, B, and the base and cap formed with the threaded tubular stems *a* and *c*, said base having the transverse opening F through it, and the nipple G thereto to render the oil-feed visible, in combination with the valve having on its rod the threaded enlargement L, screwing within stem *a*, and with the threaded stop P, screwing into cap C, substantially as set forth.

2. The base A, with tubular stem *a*, and depending extension E, with valve-nipple G at the bottom of said stem, and the cap C, provided with threaded central stem portion engaging with stem *a* to hold the body B in position, in combination with the valve-rod J K L M, the adjustable stop P, engaging with the cap C, and the sleeve S, interposed between the stop and the part L of the rod, substantially as set forth.

388,768. CARPET-SWEEPER. WALTER J. DREW, Grand Rapids, Mich., assignor to The Bissell Carpet Sweeper Company, same place. Filed Feb. 2, 1888. Serial No. 262,722. (No model.)



Claim.—1. The combination, with a carpet-sweeper casing and its pivoted dust-pan, of an angular wire having a fixed point of attachment to the casing and connected with the pan and forming in itself a pressure-bar to open the pan by pressing upon the wire, and which by its inherent elasticity will automatically close the pan, substantially as described.

2. The combination, with a carpet-sweeper casing and its dust-pan, of an angularly-bent spring-wire secured to the casing and extending from its point of attachment toward the side of the casing and then turned downward and connected to the pan and constituting in itself a pressure-bar to open the pan and by its inherent elasticity automatically closing the pan, substantially as described.

3. The combination, with a carpet-sweeper casing and its dust-pans, of a single piece of spring-wire secured to the casing and angularly bent and extending to and connected at its opposite extremities to the pans to form pressure-bars for opening the pans, and which by their inherent elasticity automatically close the pans, substantially as described.

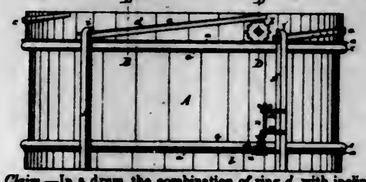
388,769. VEHICLE-SPRING. WILLIAM H. BOELEN, St. Louis, Mo. Filed Dec. 27, 1887. Serial No. 258,177. (No model.)

Claim.—1. A spring composed of two sections which are connected together at their heel ends by a connection which holds the sections in the same relative position, but which permits them to move in and out, substantially as described.

2. The combination of a spring composed of two sections which have their central portions placed in or almost in contact with each other, with a connection which unites the central portions of the sections together so as to retain them in the same relative position, but which connection allows the sections a free in-and-out play, substantially as described.

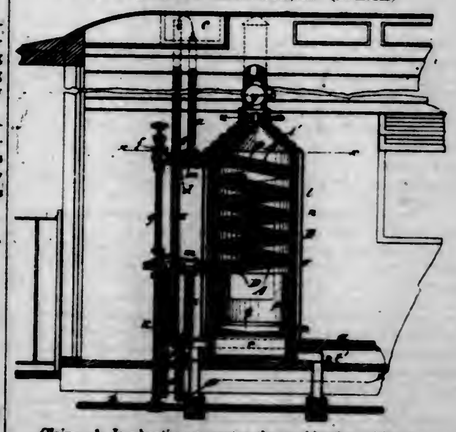
3. The combination of a spring composed of two sections with a connection which is secured to one section and through which the other section passes, but which is not secured thereto, so as to allow the sections an in-and-out movement, substantially as set forth.

4. A vehicle-spring composed of two or more sections, each section having two or more flexion-arms and having their heel ends inclosed in a common sleeve operating to hold the ends of the sections in the same relative position to each other, and at the same time permit them to approach and recede from each other in action.



5. A vehicle-spring composed of two sections united at their heel ends by a sleeve, in combination with a body and running-gear of a vehicle, for the purpose set forth.

388,770. TRUCK-BAR. JOSEPH H. FISHER, Deerfield, Ill. Filed July 14, 1888. Renewed July 2, 1888. Serial No. 278,057. (No model.)

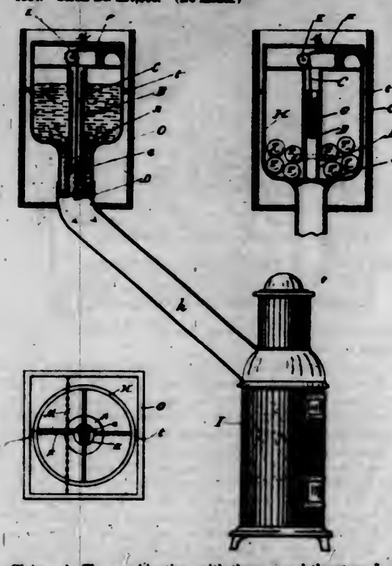


Claim.—A new tool or truck-bar consisting of the bar part D, the prongs or jaws B C, and the roller E, pivoted in the bar so as to project below the same and form a fulcrum, as specified.

388,771. MILITARY DRUM. BERNHARD PLESS, Mühlhausen, Thuringia, assignor to Heilbrunn Söhne, Erfurt, Germany. Filed Nov. 30, 1887. Serial No. 256,474. (No model.) Patented in Germany June 10, 1886, No. 34,994; in Austria-Hungary Jan. 28, 1888, No. 36,925; in England June 30, 1886, No. 8,868, and in Italy June 30, 1886, No. 20,256.

Claim.—In a drum, the combination of ring *d*, with inclined surfaces *e e* around the upper drum-head, with rod *f* attached to the lower drum-head and sliding upon the inclined surfaces *e*, and with means of turning the ring *d*, substantially as and for the purpose specified.

388,772. HEATING APPARATUS. EDWARD R. GOLD, New York, N. Y. Filed Aug. 25, 1887. Serial No. 247,793. (No model.)



Claim.—1. In a heating apparatus, the combination, with a water-coil and a steam-coil arranged one within the other, of a stove within which the double coil is placed, a source of steam connecting to the steam-coil, and a water-circulating system connected to the water-coil, substantially as set forth.

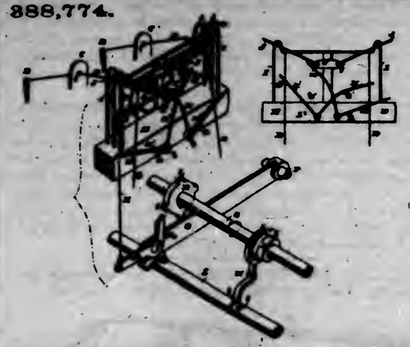
2. The combination, with the coil A and circuit-pipes *a*, connecting to the terminals thereof, of the inner heating-coil, D, inclosed in coil A, with its ends projecting from the ends thereof, a source of steam connected to one end of said steam-coil, and a trap connected to the opposite end of the same, substantially as shown and described.

3. The compound coils D A, in combination with a stove, B, inclosing and arranged to heat said coils, water-circuit pipes *a*, connecting to coil A, and a steam-supply pipe, *g*, connecting to one end of the coil D, with a valve, *f*, in the connection, and a trap, *i*, on the opposite end of the coil, substantially as herein shown and described.

388,773. FIRE-EXTINGUISHER. ISAAC H. GOODNIGHT, Kempton, assignor of one-half to J. T. Lindsay, Frankfort, Ind. Filed Feb. 17, 1887. Serial No. 227,999. (No model.)

Claim.—1. The combination, with the car and the stove I, of a fire-extinguisher comprising the following elements, viz: the frame O, secured to the car above the stove, the reservoir H, pivoted within said frame, the tube A, communicating with the reservoir and stove, the sliding tube B, valve A, attached to said tube and held down to close communication between the reservoir and stove by cord or chain C, fixed pulley D, drum E, pawl F, and the spring G, to operate upon the valve to press it open when the cord C is loosened by the movement of the car, all constructed and arranged substantially as shown and described.

2. The swinging reservoir H, pivoted within the frame O, secured to the car, the stove I, and the tube A, connecting the stove and reservoir, in combination with the valve A, the cord C, pulley D, drum E, and ratchet F, all for holding the valve closed, and the chain M and spring G for automatically opening the valve, all substantially as shown and described.



388,774. STOP-MOTION FOR KNITTING-MACHINES. ROBERT B. SCOOTHAM, Philadelphia, Pa., assignor of two-thirds to A. Taylor & Son and Abraham Lincoln Goodyear, all of same place. Filed Feb. 2, 1888. Serial No. 262,787. (No model.)

Brief.—The object of the invention is to provide improved devices for stopping the knitting-machines upon the breaking of a thread or the occurrence of a knot.

Claim.—1. The combination of the rotary needle-head with two or more guides over which the thread is guided, one or more loose bars resting upon and supported by the thread guided by said guides, a loosely-supported lever arranged below said loose bars, a trip actuated by said lever when the bar drops upon it, a rotating part in connection with the knitting-machine having a projection or tooth adapted to strike said trip, and mechanism, substantially as described, actuated by the trip to stop the rotation of the needle-head.

2. The combination of the rotary needle-head with two or more guides over which the thread is guided, one or more loose bars resting upon and supported by the thread guided by said guides, a loosely-supported lever arranged below said loose bars, a trip actuated by said lever when the bar drops upon it, a rotating part in connection

388,774.

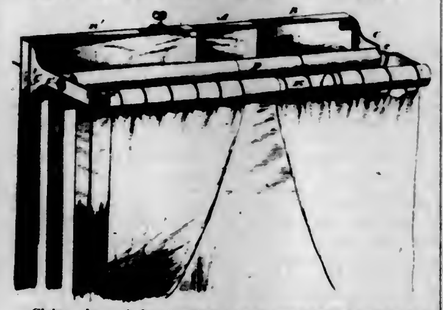
with the knitting-machine having a projection or tooth adapted to strike said trip, and mechanism consisting of a movable bar, a spring to move said bar, a catch to hold said bar against the spring, and a support for the trip adapted to actuate the catch and actuated by the trip, and means, substantially as set out, actuated by the movable bar to stop the rotation of the needle-head.

3. The combination of the rotary needle-head, a thread-guide, a loosely-supported lever, a pivoted forked lever between the fork of which the thread passes, adapted to operate the loosely-supported lever when a knot in the thread passes into the fork, power devices to rotate the needle-head, power-arresting devices controlled by the loosely-supported lever when moved by the forked lever, consisting of a trip connected to the loosely-supported lever, a rotating part in connection with the machine, having a projection or tooth adapted to strike the said trip, and mechanism, substantially as described, actuated by the trip to stop the machine on the knot in the thread passing to the needles.

4. The combination of the rotary needle-head, a thread-guide, a loosely-supported lever, a pivoted forked lever between the fork of which the thread passes, adapted to operate the loosely-supported lever when a knot in the thread passes into the fork, power devices to rotate the needle-head, power-arresting devices controlled by the loosely-supported lever when moved by the forked lever, consisting of a trip connected to the loosely-supported lever, a rotating part in connection with the machine, having a projection or tooth adapted to strike the said trip, and mechanism, substantially as described, actuated by the trip, consisting of a movable bar, a spring to move said bar, a catch to hold said bar against the action of the spring, and a support for the trip adapted to actuate the catch, and means, substantially as set out, actuated by the bar to stop the machine on the knot in the thread passing to the needles.

5. The combination of a rotary knitting-head, power stop-motion mechanism to rotate it, two or more thread-guides, I, arranged parallel, the stand or frame F, located between the upright portions of said thread-guides I, floating bars or arms J, pivoted to said frame F, the loosely-pivoted lever G, arranged below said bars or arms, and also pivoted to said frame F, a trip device controlled by said loosely-pivoted lever G, and stop-motion mechanism, substantially as set out, controlled by said trip device to stop the rotation of the needle-head if the thread should break and allow the bar J to fall.

6. The combination of a rotary knitting-head, power stop-motion mechanism to rotate it, two or more thread-guides, I, arranged parallel, the stand or frame F, located between the upright portions of said thread-guides I, floating bars or arms J, pivoted to said frame F, the loosely-pivoted lever G, having the parallel arms G′, arranged below said bars or arms, and also pivoted to said frame F, a trip device controlled by said loosely-pivoted lever G, and stop-motion mechanism, substantially as set out, controlled by said trip device to stop the rotation of the needle-head if the thread should break and allow the bar J to fall upon the arms G′.



7. The combination of a rotary knitting-head, power stop-motion mechanism to rotate it, a thread-guide, I, the stand or frame F, located between the upright portions of said thread-guide I, the forked levers K′, the loosely-pivoted lever G, pivoted to the said frame F, a trip device controlled by said loosely-pivoted lever G and having the parallel arms G′, stop-motion mechanism, substantially as set out, controlled by said trip device to stop the rotation of the needle-head if the thread should be knotted and the levers K′ should strike the arms G′, and stop L, located on the frame of the machine to hold the levers K′ normally in place.

8. The combination of a rotary knitting-head, power mechanism to rotate it, two or more thread-guides, I, arranged parallel, a frame or stand, F, located between the upright portions of said thread-guides

I, forked levers K', loosely-pivoted lever G, pivoted to the frame F, having parallel arms G', and short arm *g*, trip M, supporting-arm O, upon which the trip M is pivoted, link or wire H, connecting said trip M with the short arm *g*, shaft Q, carrying toothed wheel R, adapted to operate the trip M, lock T, spring V, shifting-lever W, clutch X, and pulley Z.

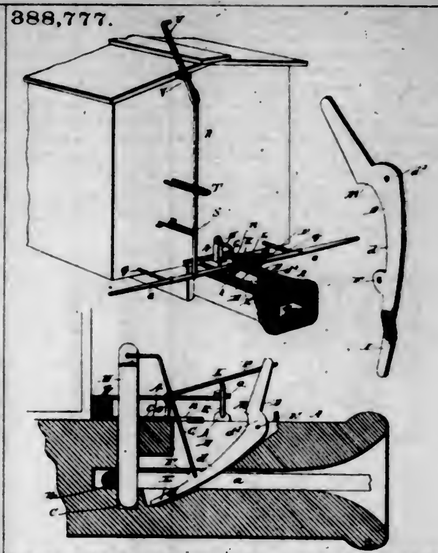
9. The combination of a rotary knitting-head, power mechanism to rotate it, two or more thread-guides, I, arranged parallel, a frame or stand, F, located between the upright portions of said thread-guides I, floating bars or arms J, pivoted to said frame F, loosely-pivoted lever G, pivoted to the frame F, having the parallel arms G', and short arms *g*, trip M, trip-supporting arm O, upon which the trip M is pivoted, link or wire H, connecting said trip M and short arm *g*, shaft Q, carrying toothed wheel R, adapted to operate the trip M, lock T, spring V, shifting-lever W, clutch X, and pulley Z.

388,775. **WINDOW-SHADE BRACKET.** Thomas Gorsuch, Gorsuch, Pa. Filed Apr. 19, 1888. Serial No. 271,166. (No model.)

Claim.—In a window-bracket, a back consisting of two flat hollow sections, B and B', movably mounted on an inclosed solid flat supporting-strip, A, and carrying bracket-arms C C, secured to the ends of said sections B and B' and projecting outwardly at right angles therefrom, in combination with an outer roller, E, and an inner roller, D, mounted in said bracket-arms, and each consisting of two tubular sections movably mounted on an inclosed solid bearing-rod, substantially as described.

388,776. **WINDOW-DRESSER.** George F. Hall, Newark, N. J. Filed Apr. 21, 1888. Serial No. 271,434. (No model.)

Claim.—1. In a window-dresser, the combination, with the shank, of the arms extended from the opposite sides of the shank, the jaws pivoted separately thereto and extended inward toward one another, such jaws being provided with lever-arms extended inwardly therefrom and having slotted ends lapped upon one another, and a rod connected at one end to such slotted ends and extended to the base of the shank, substantially as herein set forth.



2. In a window-dresser, the combination, with a shank and a pair of jaws carried thereby, of sockets in the jaws for carrying removable holders and a rod arranged and adapted to be operated to actuate the jaws from the base of the shank, substantially as set forth.

3. In a window-dresser, the combination, with the tubular shank H, of the arms C, extended from the opposite sides of the shank, the jaws A, pivoted to such arms and extended inwardly to contact with one another, the butts of such jaws being provided with lever-arms A', extended inward therefrom, a rod, G, inserted within the tubular shank and connected with both of such lever-arms, a spring, *f*, within the base of the tubular shank operating to hold the jaws in their operative position, and the lever-handle T, carried upon the shank near its base and acting in opposition to the spring, substantially as herein described.

388,777. **CAR-COUPLING.** Henry B. Johnson, Clay Centre, Kans., assignor of one-half to Rasin Isms, same place. Filed May 24, 1888. Serial No. 274,966. (No model.)

Claim.—1. In a car-coupling, the combination, with the draw-head having a longitudinal slot therein, of the bent operating-lever D, mounted in the slot and having a toe, I_f on its lower end, and the pin

388,777.

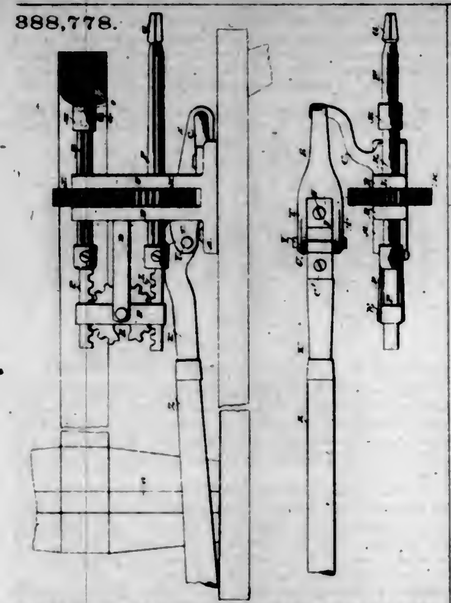
E in rear of the lever and connected thereto, substantially as and for the purpose specified.

2. In a car-coupling, the combination, with a draw-head having a slot, B, therein, of the operating-lever mounted in the slot and having an inclined lever-arm connected to the coupling-pin, and the loop or arm mounted on the upper side of the draw-head and adapted to bear against the upper arm of the lever, and having cranks whereby it may be operated, substantially as specified.

3. In a car-coupling, the combination, with the draw-head, of the operating-lever mounted therein and having a shoulder, M, on its rear side, the coupling-pin mounted in rear of the lever, the connecting-rod between the lower arm of the lever and the said pin, and the rock-shaft mounted on the draw-head, and having a loop to bear against the upper arm of the lever and adapted to engage the said shoulder, substantially as specified.

4. In a car-coupling, the combination, with the draw-head, of the vertical pin, the operating-lever connected thereto, the rock-shaft having a loop to bear against the lever and crank-arms on its ends, and the horizontal levers mounted on suitable brackets or supports on the car and connected at their inner ends to the said cranks, substantially as specified.

5. In a car-coupling, the combination, with the draw-head, the pin, the operating-lever connected thereto, and the rock-shaft having a loop and cranks, as described, of the horizontal levers connected to the said cranks, the vertical uncoupling-lever mounted on the end of a pivoted loop and connected at its lower end to one of the horizontal levers, and the handle connected to the upper end of the uncoupling rod and operating in a keeper on the car-body, substantially as specified.



6. In a car-coupling, the draw-head having a slot, B, the pin mounted in the draw-head, the operating-lever mounted in the slot and connected to the pin, the rock-shaft adapted to operate the lever and having a crank on its ends, and the horizontal levers connected to the said cranks, combined with the vertically-movable uncoupling-lever mounted on the end of the swinging loop and seated at its lower end in an aperture in one of the levers, the guide-bracket to guide the uncoupling-lever, and the loose handle mounted in a keeper on the car and connected at its lower end to the upper end of the uncoupling-lever, substantially as and for the purpose specified.

388,778. **TIRE-BOLTER AND CUTTER.** William A. Johnson, Aurora, Ill., assignor of one-half to A. Walter Johnson, Council Bluffs, Iowa. Filed May 10, 1888. Serial No. 273,206. (No model.)

Claim.—1. The combination, in a machine for bolting tires, of the frame, the two shafts sliding longitudinally therein and oppositely movable, and gearing between the same to impart a rotary motion from one to the other, one of said shafts having a socket adapted to receive the nut of a bolt, substantially as described.

2. The combination of the base or frame having the standards B, the shafts F K, journaled in said standards and movable longitudinally in their bearings, said shafts having the rack-bars, and one of said shafts being provided with the socketed head, for the purpose

388,778.

set forth, the gear-wheel journaled in a suitable support and meshing with the rack-bars, and the gear-wheels feathered or splined on the shafts and meshing with each other, substantially as described.

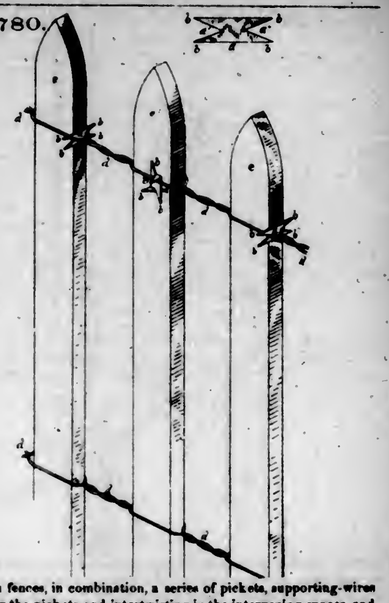
3. The combination of the frame or base, the link S, having one end pivotally connected to the frame and the other provided with a cutting jaw or blade and an adjustable stop, and the lever X, pivoted to the free end of the link and having a cutting jaw or blade, substantially as described.

4. The combination of the base plate or frame, the link S, pivoted or hinged thereto and having the adjustable stop D' on one side and the cutting jaw or blade V on the opposite side at its free end, and the lever X, pivoted to the free end of the link, adapted to be engaged by the adjusting stop or bolt, and having the cutting blade or jaw C, adapted to operate in conjunction with the blade V, substantially as described.

388,779. **SAW-ROD.** John M. Kemmerle, Philadelphia, Pa., assignor to Thomas Devlin & Co., same place. Filed Apr. 7, 1888. Serial No. 269,910. (No model.)

Claim.—1. A saw-rod consisting of yokes, rods with flaring ends, and a buckle, each of the yokes having a loop adapted to embrace one of the frame-pieces of the saw, an eye the walls of which engage the flaring ends of the rods, and a neck which connects said yoke and eye and has the end of a rod seated on its face, said parts being combined substantially as described.

2. The combination of the yokes, each with an upturned eye and a grooved neck having a recess therein, the rods having flaring ends, and a buckle, substantially as described.



3. The combination of the yokes C, each having a loop part, *a*, an eye, *b*, connected by the neck *c* to said loop *a* and turned up as to said loop, the neck *c* having on its upper face the groove *d*, the buckle E, and rods D, each screw-threaded at one end and flaring, as at *e*, at the other end, substantially as and for the purposes described.

388,780. **PICKET AND BARBED FENCE.** James Locher, Decatur, Ill. Filed Nov. 21, 1887. Serial No. 255,676. (No model.)

Claim.—1. In fences, in combination, a series of pickets, supporting-wires embracing the pickets and intertwisting in the intervening spaces, and barbs on the wire in the intervening spaces projecting beyond the pickets on both sides of the fence, as and for the purpose set forth.

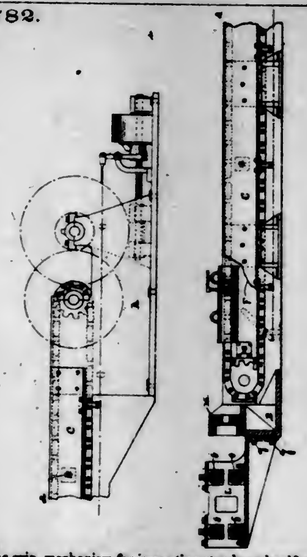
2. In fences, in combination, a series of pickets, supporting-wires embracing the pickets and intertwisting in the intervening spaces, and barbs supported against edges of pickets by the wires and adapted to project beyond the faces of the same, as and for the purpose set forth.

388,780.

3. In fences, in combination, a series of pickets, supporting-wires embracing the pickets and intertwisting in the intervening spaces, and the cleft barbs fitting against edges of pickets, with their clefts astride the supporting-wires, as and for the purpose set forth.

4. In fences, in combination, a series of pickets, supporting-wires embracing the pickets and intertwisting in the intervening spaces, cleft barbs fitting against edges of pickets, with their clefts astride the supporting-wires, and barbs on the faces of pickets sustained by an embracing-strand of wire, as and for the purpose set forth.

388,781. **BANJO.** John F. Luscomb, Boston, Mass. Filed June 16, 1886. Renewed Feb. 16, 1888. Serial No. 264,185. (No model.)

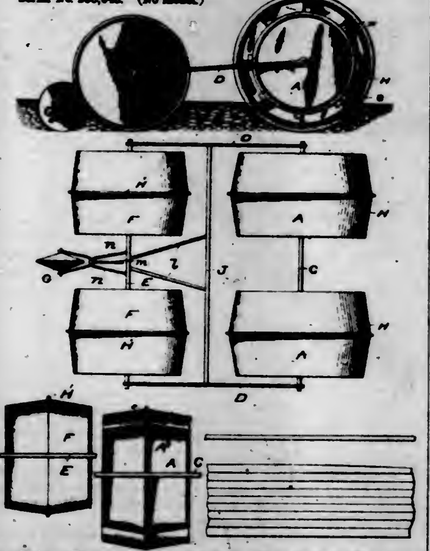


Claim.—1. The body of a banjo composed of inner and outer metal bands, A^9 A^5, and an intermediate wooden band, A^4, the inner metal band having an outer peripheral shoulder or ridge, *a*, and the intermediate wooden band a projection beyond the upper edge of the inner band, and the whole combined with a parchment head stretched across and applied to the wooden band and metal bands, substantially as described, for the purpose specified.

2. A banjo having a wooden neck, C, made and provided with a series of wooden cross-pieces, E, secured in cross saw-cuts at the back of the neck, substantially as described, for the purpose specified.

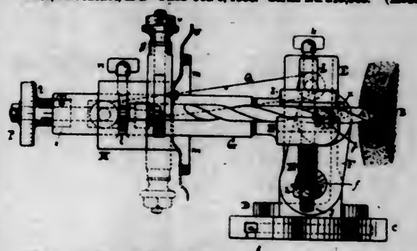
388,782. **MACHINE FOR DRAWING METALS.** William A. McCoy, Beaver Falls, Pa., assignor to the Hartman Steel Company, (Limited,) same place. Filed Jan. 28, 1888. Serial No. 262,212. (No model.)

Claim.—1. A drawing-machine for drawing metals, which consists of two drawing-chains, one on each side of the carriage which



388,782.

supports the grip, mechanism for imparting steady and uniform motion to said chains, and pins or other devices for connecting said carriage with each of said chains, substantially as and for the purpose described.



2. The above-described drawing-machine, provided with a die, a grip, and two chains for imparting motion to said grip, so combined and arranged that the center of the die, the grip, and the center of each and every pin in the two chains is on a direct line with draft, as herein described, and for the purpose specified.

388,783. BOAT. Herbert R. McGuire, Pearington, Miss., assignor of one-half to John Wesley Cowart, same place. Filed Nov. 19, 1887. Serial No. 255,643. (No model.)

Claim.—The combination, in a boat, of the side bars, D, connecting the front and rear axles, and the cross-bar J, connecting the said side bars, substantially as specified, the drive-wheels having an inner air-tight section with a periphery of keel shape and arranged at intervals from the outer section, the central flange between the two sections, the transverse strips, also between the two sections, forming the buckets, and the transverse bars L, secured to the inner sides of the said strips and on the periphery of the said inner air-tight section, the shaft for said wheels, the smaller air-tight wheels in rear of the drive-wheels, also having peripheries of keel shape and a vertical central external flange, the steering-wheel in a plane between the said smaller wheels, the stay-rods therefor, and the tiller *m*, substantially as specified.

388,784. TWIST-DRILL-GRINDING ATTACHMENT. Frank Hoffman, Pawtucket, R. I. Filed Oct. 6, 1888. Serial No. 287,302. (Model.)

Claim.—1. In a drill-grinding attachment, the clamping device herein shown, consisting of the fixed grooved jaw H and the movable jaw I, which has the post and arm L, and the thumb-screw *k* and the bolt J, secured to said jaw I and passing freely through an opening in the jaw H, and provided with a nut, *k*, and spring K, substantially as described.

2. The combination of the jaws H I and the bolt J, having the nut *k* and spring K, arranged and operating substantially as specified.

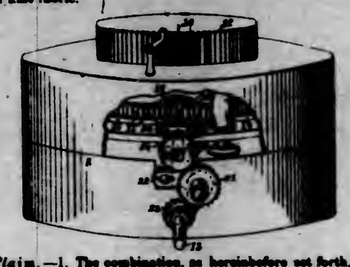
3. The combination of the link F, the pivot *f*, the head-piece E, and the main bar G, provided with drill-clamping mechanism and mounted on the link F by the pivot *g*, substantially as described.

4. The combination of the head-piece E, having the slot *e*, the sliding nut *t*, and screw *s*, the rod Q, pivot *r*, and block N, connected to the bar G, the link F, pivoted at *f* to said head-piece, and the bar G, pivoted at *g* to said link F and provided with a drill-clamping device, substantially as shown.

5. The combination of the head-piece E, having the slot *e*, the nut *t*, the screw *s*, the rod Q, the pivot *r*, the block N, the link F, the bar G, having the lugs *o o'*, the pivots *f g*, and the feed-screw O, substantially as specified.

6. In a drill-grinding device, the combination of a head-piece, a main bar provided with drill-clamping, drill-feeding, and drill-straining mechanism, a link oscillating on a fixed pivot of the head-piece and having at its traveling end a pivot by which it connects with the main bar and gives to said main bar a reciprocating motion longitudinally, and a connecting-rod pivoted at one end in the plane of the main bar and vertically adjustable at its opposite end upon said head-piece, all arranged and operating for the purpose of forming an angle and a curved clearance upon the lip of a drill, substantially as specified.

388,785. PRECAUTIONARY DEVICE FOR POISON-BOTTLES. Frank H. Nutter, Minneapolis, Minn. Filed Apr. 11, 1888. Serial No. 270,260. (No model.)



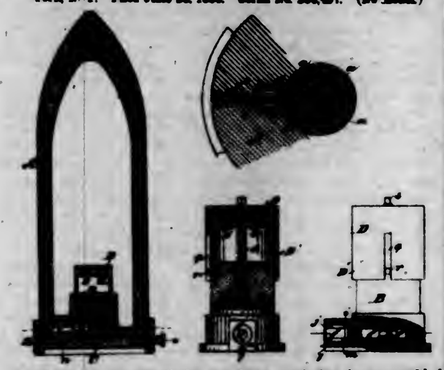
Claim.—1. In a device of the character described, a plate, C, having pricking-points on its upper face and an attaching corkscrew at its opposite side, substantially as set forth.

2. In a device of the character described, a centrally-apertured plate, C, having pricking-points on its upper face, the corkscrew having its shank passing through said aperture and provided with an eye, the spring-collar *d*, and the flexible connection D, connecting said eye and collar, substantially as set forth.

3. The combination, with a bottle-stopper or cork, of a plate having pricking-points on its outer face and a fastener on its under face entering the cork and securing the plate on top thereof, substantially as set forth.

388,786. Knitting-Machine. Nathaniel W. Pierce, Pawtucket, R. I., assignor of one-half to George H. Church, New York, N. Y. Filed Feb. 28, 1887. Serial No. 229,115. (No model.)

Brief.—The invention consists in improved means for dividing the needles vertically in predetermined series to produce a particular pattern of knit fabric.



Claim.—1. The combination, as hereinbefore set forth, with a rotary needle-cylinder provided with a driving-shaft having a pinion, of the needles, a cam-cylinder having a cam-groove for the needles, a rotary needle-lifter adapted to engage the needles, an arbor for turning the needle-lifter and provided with a cog-wheel, and an idle-gear wheel in mesh with the cog-wheel and pinion respectively, substantially as herein described.

2. The combination, as hereinbefore set forth, with a needle-cylinder and needles, of a cam-cylinder for the needles provided with removable sections 27, the rotary needle-lifter 16, supported near the needles and acting to lift the needles, and means for rotating said needle-lifter, substantially as herein described.

3. The combination, as hereinbefore set forth, with a rotary needle-cylinder and needles and the needle-lifter, of the cam-cylinder 14, provided with the cam-groove 15, and the auxiliary cam-tracks 29 and 30, having a support and provided with means of adjustment, substantially as described.

4. The combination, as hereinbefore set forth, with a needle-cylinder provided with the drive-shaft 18, having the pinion 23, of the needles and the cam-cylinder therefor, the rotary needle-lifter 16, having the arbor 19, provided with the cog-wheel 20, and the idle-pinion 21, gearing with said cog-wheel and pinion, substantially as herein described.

388,787. Multiple Primer for Shells. Nat. W. Pratt, Brooklyn, assignor to the Pneumatic Dynamite Gun Company, New York, N. Y. Filed June 23, 1888. Serial No. 278,497. (No model.)

Claim.—1. A projectile for carrying an explosive charge provided with a series of independent plungers for exploding the fulminates, a series of independent fulminates mounted clear of the plungers, and a lock for normally holding said plungers positively against movement toward the fulminates, but automatically unlocked when the projectile leaves the gun, each plungers being then kept from impingement against the fulminates by inertia, substantially as described.

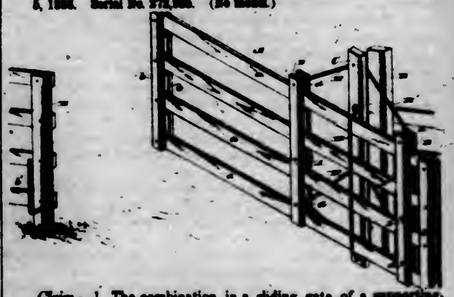
2. A projectile provided with a series of plungers for exploding a fulminate, a series of fulminates in position to be exploded by said plungers, and a case for containing said plungers and fulminates, having an adjustable end to vary the distance between the striking-point of the plungers and the fulminates, whereby to regulate the time utilized to explode the charge after the projectile strikes an object or is embedded therein.

3. A projectile provided with a plurality of plungers for exploding a fulminate, a spring-seated bolt for locking the plungers in position when placed in the projectile or in the barrel of a gun, and a temporary collar adapted to be placed upon the butt of the projectile when out of the gun to hold the bolt in its locking position, substantially as described.

4. A primer-case for projectiles provided with a plurality of plungers for exploding a fulminate, a spring-seated bolt for locking the plungers in position, and a spring-pin for normally holding the bolt in its locking position, and adapted to be disconnected to free the bolt when the case is inserted in place in the projectile by the engagement of the spring with the wall of the projectile, substantially as described.

5. In a projectile, the combination, with a case having chambers containing plungers for exploding a fulminate, of a lead to said case provided with the fulminate and sustaining it a distance removed from the points of the plungers, and an adjusting-screw for adjusting the position of the lead to vary the distance between the fulminate and plungers, substantially as described.

388,788. Hose-Nozzle Supporter. Oliver P. Prescott, Boston, Mass., assignor to himself, Charles S. Prescott, and John W. Prescott, same place. Filed June 6, 1888. Serial No. 276,286. (No model.)

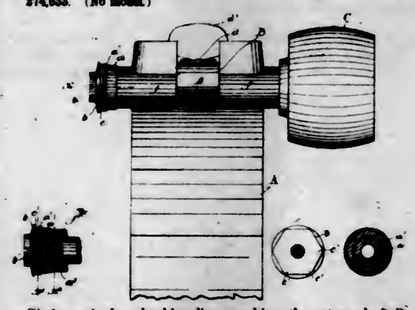


Claim.—1. The described hose-nozzle supporter, consisting of the base B, with its diverging legs A A A, forming a portable tripod, in combination with the standard provided at its upper end with spring-actuated clamp-jaws I J, to hold the nozzle, and with a bolt and thumb-screw, O S, adapted to secure said standard frictionally to the base when adjusted, substantially as set forth.

2. The legs A and the base B, formed with a concave socket and with a central aperture, Q, as described, in combination with the hose-supporting standard having slotted bulb D, the screw-eye P therein, and the bolt O and thumb-screw S, engaging with said screw-eye, substantially as set forth.

3. The hollow standard, made in two parts, E F, united transversely, one of said parts prolonged to form the curved jaw I, in combination with the jaw J and its handle K, cast integral and pivoted in bearings in the parts E F, and with a pressure-spring, M, substantially as set forth.

388,789. Gate. John R. Rowe, La Fontaine, Kans. Filed May 8, 1888. Serial No. 273,295. (No model.)

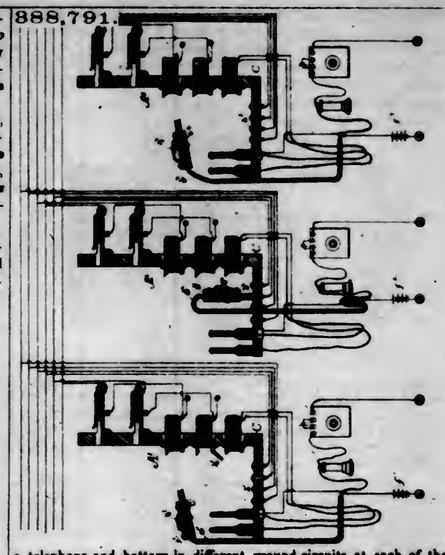


Claim.—1. The combination, in a sliding gate, of a supporting-post, B, having a post, C, pivotally secured thereto, vertical battens D D, held apart from each other by blocks *d d*, said battens being

located on each side of the post C, and equidistant therefrom, brace-rods E and E', F and F, and G and G, extending from the battens to the pivoted post C, and rollers I, upon which the gate slides, whereby a thoroughly-braced gate-support is provided, adapted to resist upward or downward strain upon the gate-support, substantially as shown, and for the purpose set forth.

2. The combination, in a horizontally swinging and pivoted gate, of the post C, suitably pivoted to the supporting-post B, vertical battens D, and brace-rods E, F, and G, extending from the post C to the battens, as shown, supporting-wheels I, secured between said battens, upon which the gate slides, and a bar, H, with inwardly-bent ends secured to the pivoted post C, substantially as shown, and for the purpose set forth.

388,790. **HEEL-BEADING MACHINE.** Joshua H. Ryder, Brockton, Mass., assignor of one-third to George V. Scott, same place, and George H. Dotes, Plymouth, Mass. Filed May 22, 1888. Serial No. 274,633. (No model.)



Claim.—1. In a heel-beading machine, the rotary shaft B and rand-guide *b*, a heel-beading tool formed integral with the said rand-guide *b*, and having one or more cam-like surfaces or projections, as *c'*, substantially as described.

2. The rotary shaft B and the rand-guide *b*, combined with the heel-beading tool having cam-like surfaces or projections *c'*, and the independent milled edge heel-rest *a*, substantially as described.

3. In a heel-beading machine, the following instrumentalities: the rotary shaft B and the rand-guide *b*, a heel-beading tool, *c*, fast thereon, combined with the heel-rest *a*, having the milled or roughened edge *a'* and loose on the shaft B, substantially as and for the purpose set forth.

4. In a heel-beading machine, the following instrumentalities: the rotary shaft B and the rand-guide *b* and heel-beading tool *c*, fast thereon, combined with the heel-rest *a*, having the milled or roughened edge *a'* and provided with a sleeve-like extension, a^2, which turns in a bearing in a part of the frame-work independent of the shaft B, substantially as described.

388,791. **SWITCH-BOARD FOR TELEPHONE-EXCHANGES.** Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Mar. 22, 1884. Serial No. 125,222. (No model.)

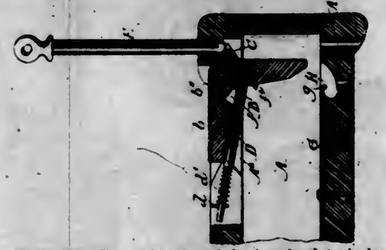
Claim.—1. The switch-boards, each having the usual switching apparatus and its group of telephone-lines, and trunk-lines between said boards, in combination with half-connection or branch terminals *b*, placed within reach of the switchmen at the different boards, whereby any switchman may test to determine whether any line of another group called for at his own board is busy.

2. The combination, substantially as hereinbefore set forth, with an electric circuit of a telephone-exchange, of a switch and an annunciator placed in said circuit at the central office, and one or more branch or half connections permanently connected with said electric circuit before the line of said circuit reaches the said switch, a half-connection terminal of said electric circuit being placed near each of the switch-boards of the lines of other groups, and means at each of said switch-boards of other groups, whereby a telephone and battery, respectively, may be alternatively connected with and disconnected from the said electric circuit.

3. In a telephone-exchange, the contact-plug *c*, provided with a key, *g*, in combination with a battery, *f*, and a telephone, and a terminal, *b*, of a branch or half connection, *a*, substantially as and for the purpose specified.

4. In a telephone-exchange system, two or more switch-boards and telephone-lines grouped upon the different switch-boards, each line being provided with a spring-jack switch and annunciator upon one of the switch-boards and extending from the annunciator to ground, each line being provided with an open branch or half connection extending to a stud or contact-piece, *b*, upon each of the other boards, a telephone and battery in different ground-circuits at each of the boards, said circuits being connected with different strands of the same cord, said cord terminating in a switching device for connecting battery or telephone at will with the contact-terminal of the said switching device, whereby an operator at one board may throw down the annunciator of any line except of the lines grouped upon his own board.

5. A telephone-line grounded at the subscriber's station and at the central office, annunciators or signal devices included in said line, one at the subscriber's station and one at the central office, and a branch or half connection from said line at a point between the signal-instruments, said branch extending to a contact or terminal, *b*, in combination with a contact-plug, *c*, and its double cord, one cord including in its circuit a telephone and the other cord including in its circuit a battery, whereby an operator at will may connect the telephone or battery with the line, substantially as and for the purpose specified.



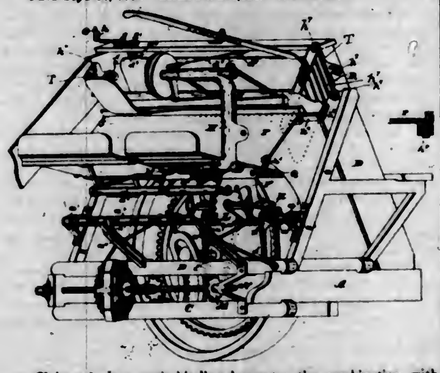
6. The combination, with telephone-lines, each including a spring-jack switch and an annunciator, of switch-boards, upon which the spring-jack switches and annunciators are arranged in groups, a branch or half connection extending from each line to a terminal stud upon each of the boards, except the board upon which its spring-jack switch and annunciator is placed, said terminals being arranged at the different boards in groups, and numbered to correspond with their lines, respectively, a contact-plug connected with a double-stranded cord at each of the boards, one strand containing a battery and the other a telephone, said connecting-plug being provided with a key, *g*, whereby the operator at any board may, by applying the contact-plug to the terminal of any line, determine by listening at any telephone whether the line is in use, and by closing the key *g* send current to line, substantially as and for the purpose specified.

7. The combination, with telephone-lines, of their individual spring-jack switches and annunciators grouped upon different switch-boards, a branch connection from each line on the line side of its spring-jack extending to a different terminal at each of the other boards, trunk-wires between the boards, a telephone and source of electricity at each of the boards, and switching apparatus, whereby an operator at any given board may test a line grouped at any other of the boards, and, having tested, throw down the shutter of said line and direct the operator answering the signal to connect said line with a particular trunk-wire, substantially as and for the purpose specified.

8. In a telephone-exchange system, the combination, with two or more switch-boards, of telephone-lines, each telephone-line being provided with a spring-jack switch and an annunciator on one of the boards only, and each line being provided with a terminal or stud upon each of the other boards, trunk-lines between the different boards, a telephone and battery connections at each of the boards, the terminal of said battery and the terminal of said telephone being each upon the same movable switch or contact plug, and switching apparatus at each of the boards, whereby an operator at one of the boards may throw down the shutter of any line located at another board, and whereby any two lines of the exchange may be connected together, substantially as described.

9. The combination, with telephone-lines from the different subscribers' stations terminating in spring-jacks and annunciators at their respective boards, of branches from all of the lines terminating in studs upon the other switch-boards, trunk-lines connecting the different switch-boards together, connecting cords and plugs with which the lines of the different boards may be connected together through the medium of the trunk-lines, switching devices in connection with the operator's telephone and calling generator to connect with the studs or terminals of the said branch connection, whereby an operator at one board may signal an operator at another board over the line wanted, to complete the connection.

388,792. **CAR-COUPLING.** Levi Showalter, Bostown, assignor of one-fourth to Reuben B. Showalter, Lancaster, Wis. Filed May 18, 1888. Serial No. 274,274. (No model.)



Claim.—1. The combination of the draw-head A, the latch B, having the toe C, the thrust-rod D, and the spring *d'*, substantially as and for the purposes described.

2. In a car-coupling, the spring G, in combination with the draw-head A, having the recess H, substantially as described.

3. In a car-coupling having the draw-head A, the combination of the latch B, having the pocket *f*, with the thrust-rod D, the spring *d'*, and the eyelet *d*, substantially as and for the purposes described.

4. In a car-coupling, the tumbling latch B, in combination with the spring G, and the draw-head A, provided with the recess H, substantially as and for the purposes described.

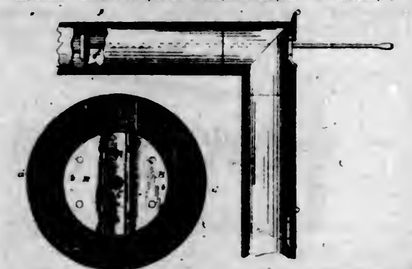
388,793. **GRAIN-BINDING HARVESTER.** Albertus O. Sleeper, Canton, Ohio, assignor to the Peerless Reaper Company, same place. Filed Sept. 30, 1886. Serial No. 214,856. (No model.)

Claim.—1. In a grain-binding harvester, the combination, with the harvester-frame, of a binder-supporting frame having a hinge-connection with the harvester-frame about the binder and packer actuating shaft, a binder-deck, one part of which is connected with the harvester-frame and another part with the binder-frame, the parts being so connected together as to be held in operative position while the binder-frame is being folded, and means for raising and lowering the binder-deck during the progressive movement of the machine, whereby the binder may be raised to pass obstructions or folded over upon the machine, substantially as set forth.

2. In a grain-binding harvester, the combination, with a binder-frame pivotally secured to the harvester about the binder and packer actuating shaft, and a binder-deck, one part of which is connected with the harvester-frame and another part with the binder-frame, the parts being so connected as to be held in operative position while the binder-frame is being folded, of gearing connecting the binder and packer actuating shaft with a drive-shaft, and a lifting device leading from the binder-frame to a point within reach of the operator, by which the binder-frame may be moved bodily about the binder and packer actuating shaft as an axis without throwing the gearing out of operative adjustment, substantially as set forth.

3. The combination, in a grain-binding harvester, of a binder-supporting frame having a hinge-connection with the harvester about the binder and packer actuating shaft, a binder-deck, one part of which is connected with the harvester-frame and another part with the binder-frame, the parts being so connected together as to be held in operative position while the binder-frame is being folded, a crank having a spring-actuated clutch and a lifting-connection between the binder-supporting frame and the crank, whereby the operator may raise the binder without disconnecting the shaft from its driver to pass over obstructions during the progressive movement of the machine or fold the binder over upon the machine and sustain it in said position for convenience in operating and transporting it, substantially as set forth.

4. The combination, with a grain-binding harvester, of a binder-supporting frame having a hinge-connection with the harvester about the binder and packer actuating shaft, binder-supporting standards, a binder-deck, one part of which is connected with harvester-frame and another part with the binder-frame, the parts being so connected together as to be held in operative position while the binder-frame is being folded, and means by which the operator may raise the binder from the standards and lower it onto the standards, substantially as set forth.



5. In a grain-binding harvester, the combination, with a binder adapted to be raised up and folded upon the machine, of a grain-deck composed of an upper and lower section having a yielding and sliding connection at the point of engagement and a cross-bar supported on the harvester-frame, upon which the upper section is loosely mounted and adapted to rock and slide longitudinally, substantially as set forth.

6. In a grain-binding harvester, a grain-adjuster provided with a hinge consisting of a bracket having perforations to receive a bolt, on which the adjuster turns, and also having a tail-piece provided with a slot in the arc of a circle adapted to receive loosely a bolt at right angles to the hinge-bolt for the purpose of allowing the movement of the adjuster in two directions, as set forth.

7. In a grain-binding harvester, a grain-adjuster having a vertical hinge, h^1, a horizontal hinge, h^2, and a circular slot, h^3, substantially as described, and for the purpose set forth.

8. In a grain-binding harvester, the combination of the hinge-pieces E and F, the former provided with the groove *d'* and flange d^2, and the latter with the groove d^3 and flange *d*, adapted to engage the flange d^2 and groove *d'* of the piece E, respectively, and the sleeve G, as a hinge and a support for the actuating-shaft and the binder, substantially as set forth.

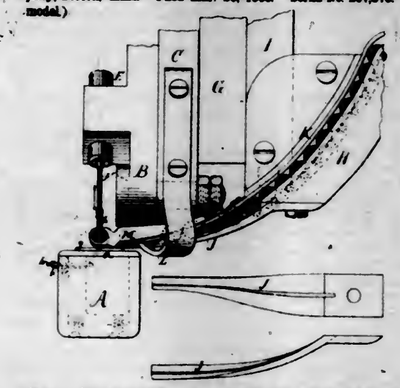
388,794. **STOVE-PIPE OR FLUE CLEANER.** Russell G. Smith, Watertown, Dak., assignor of one-half to Herschel M. Smith, Minneapolis, Minn. Filed Dec. 8, 1887. Serial No. 257,289. (No model.)

Claim.—1. In a chimney-cleaner, the combination, with the head-block adapted to have a handle applied thereto, and the two wings hinged thereto, of the spring to limit the inward movement of the wings and assist in opening them, substantially as and for the purpose specified.

2. The combination, with the head-block, of the wings composed of a rigid center, which is hinged to the head-block, and the flexible edge, substantially as described.

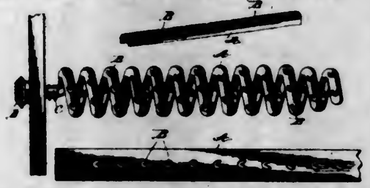
3. The combination, with the oblong-shaped head-block apertured to receive a handle, and the two wings hinged to the head-block near its opposite edges and held open by said head-block, of the spring for limiting the inward movement of the wings, substantially as and for the purpose described.

388,795. **HAY OR GRAIN COCK WEATHER-SHIELDS.** John A. Symmes and Luther B. Symmes, Sherbrooke, Quebec, Canada. Filed July 22, 1887. Serial No. 244,906. (No model.) Patented in Canada Apr. 5, 1887, No. 26,400, and in England May 6, 1887, No. 6,690.



388,795.

Claim.—1. A cover for hay-cocks or grain-stacks, consisting of a rigid water-proof shield, of concavo-convex shape, formed, without a seam, of paper-pulp, substantially as described and shown.



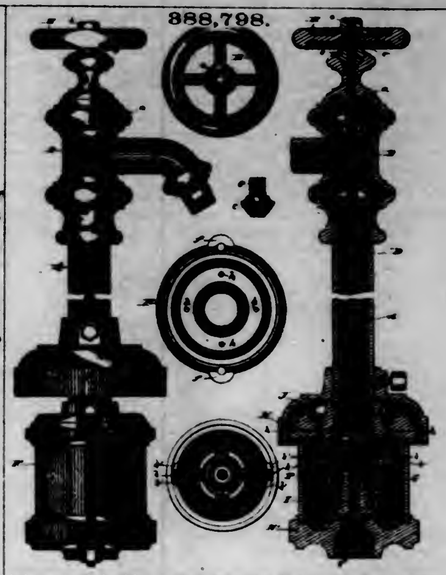
2. A cover for hay-cocks or grain-stacks, consisting of a rigid seamless radially-corrugated water-proof paper-pulp shield of concavo-convex shape, substantially as described and shown.

388,796. BUTTON-SEWING MACHINE. RENWELL THOMPSON, Bridgeport, Conn., assignor to the Morley Button Sewing Machine Company, Boston, Mass. Filed Mar. 30, 1888. Serial No. 267,570. (No model.)

Claim.—In a button-sewing machine, the combination, with its stitch-forming mechanism and work-table, of a button-pusher and swinging button-trough having on its end a button-clamping spring, M, the said spring having in its clamping end a downward bend, whereby the outermost button is separated from the next one, and a perforation which is less in diameter than the button-heads, all substantially as described, and for the purpose set forth.

388,797. METHOD OF CONSTRUCTING PICKER-STEMS. GEORGE B. TODD, Chicago, Ill., assignor to the Todd Cotton Harvester Company, of Illinois. Filed Dec. 13, 1887. Serial No. 257,763. (No model.)

Claim.—1. The herein-described methods for producing picker-stems for cotton-harvesters, the same consisting in winding into a spiral coil a toothed strip of metal and then securing to one end thereof a gear-wheel, substantially as and for the purpose described.



2. The herein-described methods for producing picker-stems for cotton-harvesters, the same consisting in first stamping, cutting, or otherwise forming teeth in or upon a flat strip of sheet metal, then bending said strip transversely of its length with the teeth upon the concave side thereof, then winding said strip into a spiral coil, and finally securing to one end of said coil a gear-wheel or its equivalent, substantially as described.

3. As a new article of manufacture, a picker-stem, the body of which is composed of a strip of toothed metal coiled spirally and having a gear-wheel or its equivalent secured to one end thereof, substantially as described.

388,798. HYDRANT. AARON J. TYLER, Albion, N. Y. Filed May 4, 1888. Serial No. 272,793. (No model.)

Claim.—1. The combination, with a stand-pipe, a water-chamber, B, attached to the upper end thereof, the head of this water-chamber

388,798.

being provided with a conical depression in its upper face, *g* valve-casing attached to the lower end of stand-pipe and provided with a valve-seat, *g*, waste-apertures being formed through this valve-seat, a vertically-movable valve in the casing F, adapted to close against the seat *g* and close the waste-apertures, a valve-rod for operating this valve, this valve-rod being journaled in the head of the water-chamber and provided with a conical enlargement, *c*, adapted to fit the conical depression in the head of the water-chamber, substantially as described.

2. In a hydrant, the combination of the stand-pipe provided with a water-chamber on its upper end and a valve-casing on its lower end, a vertically-working valve in the said casing, a valve-rod for operating this valve, this valve-rod being journaled in the head of the water-chamber and provided with a collar, *d*, a conical nut, *c*, screwed to the upper end of the valve-rod and adapted to fit closely a conical depression in the head of the water-chamber, a hand-wheel screwed on this nut *c*, and a lock-nut, *b*, screwed on the projecting end of the valve-rod, substantially as described.

3. The combination, with a stand-pipe, water-chamber, and a valve-rod, of the valve-casing consisting of a vertical cylinder, G, secured between two heads, H H', the upper head, H, being provided with waste-apertures *h*, the valve I, working vertically in the cylinder G, and consisting, essentially, of the upper ring, *n*, and lower disk, *l*, connected by vertical pillars *m*, the said valve being adapted to alternately close the waste and inlet openings, and the packing-rings, substantially as and for the purpose herein set forth.

4. The combination, with the stand-pipe, and the valve-casing F, secured to the lower end of the stand-pipe, this valve-casing consisting of a short cylinder and two heads, H H', these heads being provided, respectively, with the valve-seats *g g'*, the former valve-seat being provided with waste-apertures *h* and surrounding the outlet in the head H, of the vertically-working valve I, inclosed in the said casing F and consisting of the upper ring, *n*, and a disk, *l*, connected with the said ring by vertical pillars *m*, packings secured to the said ring *n* and disk *l*, and a valve-rod for operating the said valve I, this valve I being adapted to alternately close against the valve-seats *g g'*, substantially as described.

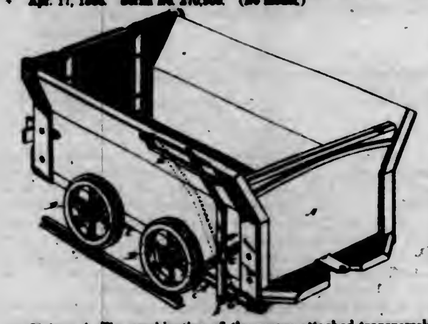
388,799. SCHUTTBOLLERAD. AARON J. TYLER, Albion, N. Y. Filed May 14, 1888. Serial No. 273,890. (No model.)

Claim.—1. The combination of a rule, a plate, F, pivoted thereto near its inner end, the rear end of the said plate being provided with lateral arms and the arms being provided with adjustable needle-points, substantially as described.

2. The combination of a rule, a plate, F, pivoted thereto near its inner end, provided with lateral arms, these arms being provided with internally screw-threaded bosses *f*, and screws G G', working in these bosses, these screws being provided with needle-points, substantially as described.

3. The combination of a rule provided with a graduated arc, *b*, a plate, F, pivoted to this rule near its inner end, this plate F being provided with a pointer, F', and an adjustable needle-point carried by the plate F, substantially as described.

4. The combination of a rule, a plate provided with two lateral arms, F', and a pointer, F', the said arms being pivoted to the rule, adjustable needle-points carried by the said lateral arms, an indicator-plate provided with a graduated arc, around which the said pointer F' moves, and a pivotal screw and thumb nut for holding the parts in any adjusted position, substantially as described.



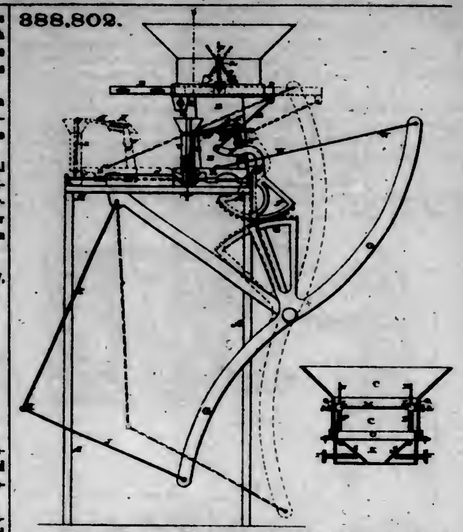
388,800. CHAMOIS-HOLDER. ANDREW T. VERMILYE, Schenectady, N. Y. Filed May 4, 1888. Serial No. 272,809. (No model.)

Claim.—1. As an article of manufacture, a chamois-holder consisting of a rod or bar having a right-angular spur and keeper erected from each end, the spurs being pointed and edged on one side, substantially as described.

2. The combination, with a bar, A, of end spurs, C, and bracket-arms B erected therefrom, and stems provided with spur-seats and vertically adjustable in the ends of the bracket-arms, substantially as described.

388,801. COAL-WAGON. JOHN R. WILSON, Greensburg, Pa. Filed Apr. 17, 1888. Serial No. 270,598. (No model.)

Claim.—1. The combination of the sprags attached transversely at proper points on one side the bottom of a pit-wagon, and mechanism, substantially as described, whereby the said sprags can from a point above or at the side of the wagon be drawn simultaneously outward between the spokes thereof, substantially as specified.



2. The combination of the transverse sprags sliding in bearings secured at proper points along one side of the under surface of the bottom of a pit-wagon, the angle-levers pivoted at their bends to said bottom, and a lever pivoted to the side of the wagon with its upper end rising thereabove, which lever is connected in such manner with said angle-levers as to move them simultaneously in the same direction, substantially as specified.

3. The combination of the transverse sprags C, arranged on one side of the wagon, the guide and retaining bearings c, the angle-levers D, the link-bar E, provided with the outstanding arm *e*, the pivoted lever F, provided with the engaging opening *f* near its lower end, and the limiting-staple H, all constructed and arranged substantially as and for the purpose specified.

388,802. GEAR-BUNCHING MACHINE. MARSH A. WRIGHT, Columbus, Ohio, assignor to Parmary R. Wright, same place. Filed Oct. 28, 1887. Serial No. 253,618. (No model.)

Claim.—1. In a bunching-machine, the combination of the hopper, the slide, a pivoted lever connected thereto by means of a rigid connecting-rod, the carriage, an operating-lever connected thereto by a rigid connecting-rod, and which lever operates the lever which moves the slide, and a treadle whereby the carriage and the slide are automatically moved at the same time in opposite directions, substantially as shown.

388,802.

2. The combination of the hopper, the slide which is moved back and forth through the bottom thereof, the rigid connecting-rod E, and the pivoted lever F, provided with teeth at its lower end, the carriage, the connecting-rod W, the lever G, which operates both the carriage and lever, and the treadle connected to the lower end of the lever G, substantially as described.

3. The combination of the slide which moves back and forth through the hopper, the carriage, the two pivoted levers, which are connected at their upper ends to the slide and carriage by rigid connecting-rods, and the treadle, the two levers being geared together, so as to cause the slide and carriage to move simultaneously in opposite directions, substantially as set forth.

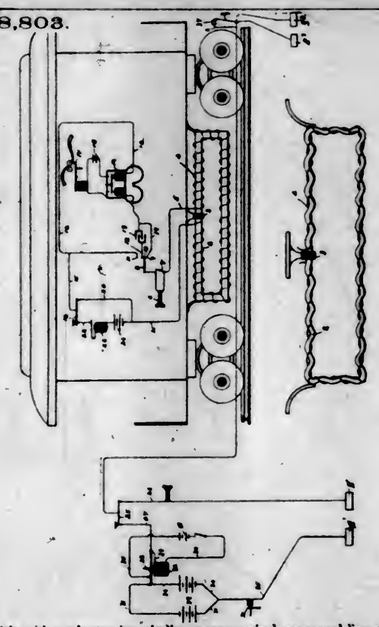
4. The combination of the carriage, the funnel connected thereto, a shaper or former placed inside of the funnel and having a vertical movement, a spring-actuated lever connected to the shaper or former, a stop for moving the lever when the carriage is returned to position, and the apron, substantially as specified.

5. The combination of the carriage, the lever for moving it, the funnel secured to one end of the lever, the shaper or former placed inside of the funnel, the slides connected to the shaper or former, the connecting-rods Z, pivoted spring-actuated levers A', the adjustable blocks connected to the levers, the stops, and the apron, substantially as shown.

6. The combination of the funnel, the carriage connected thereto, the shaper or former provided with springs W', pins X, connected to the slides Y, and which pass through slots in opposite sides of the funnel, the wings, connecting-rods Z, spring-actuated levers A', provided with adjustable blocks D', the stops E', and the apron, substantially as described.

7. The combination of the support for the hopper, the hopper, the slide provided with a pocket, and the guide K, provided with an adjustable wing or wings, substantially as set forth.

8. The combination of the hopper, the slide provided with a pocket, the plunger, the rods connected to the plunger, the springs placed around the rods, and the journals or bearings through which the rods pass, substantially as specified.

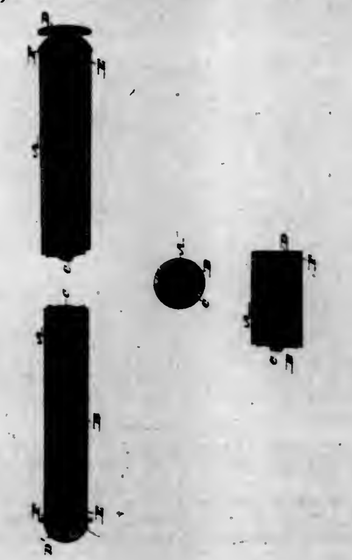


9. The combination of the hopper, the journals placed therein, the slide provided with a pocket, the plunger having the rods N, connected to opposite ends, and the springs around the rods, the journals being connected together by the cross-rod M, substantially as shown.

10. The combination of the hopper, the slide provided with a pocket, the plunger O in the hopper, the rods N, which extend upward from the plunger, the pivoted journals through which the rods N pass, the springs placed around the rods, and the pins which are passed through the rods, substantially as described.

388,803. RAILWAY-TELEGRAPHY. GRANVILLE T. WOODS, Cincinnati, Ohio. Filed July 14, 1887. Serial No. 244,268. (No model.)

Claim.—1. In a system of electric communication of the character described, in combination with a fixed line-conductor arranged in or parallel with the path of the vehicle, a transmitting and receiving coil having its convolutions brought into planes approximately paral-

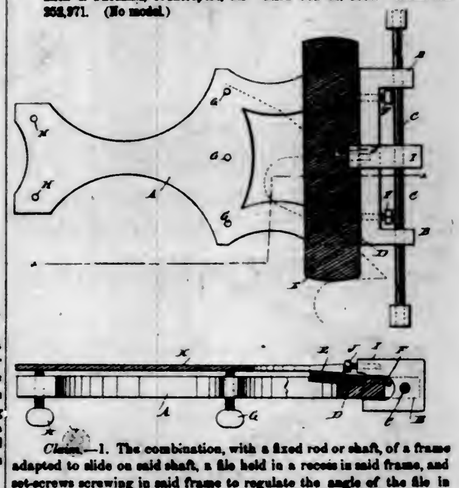


388,803.

lel with said conductor by winding upon a spiral or waved line core, substantially as set forth.

2. In a system of communication of the character described, a receiving and transmitting apparatus adapted to be carried by the car in inductive proximity to the line-conductor, consisting of a metallic core in rectangular form, as shown, bent to a spiral or waved line in the direction of its axial length with disconnected ends, and having an insulated wire helix wound thereon in a spiral corresponding with the longitudinal contour of the bar and circuited through the signal receiving and transmitting instruments upon the car, substantially as set forth.

388,804. RUST-PREVENTER FOR FIRE-ARMS. CHARLES I. WORCESTER, Berlin, N. J. Filed May 3, 1888. Serial No. 272,664. (No model.)



Claim.—1. A gun-plug composed of oil absorbing or containing material and provided with caps at the ends thereof adapted to engage the ends of the gun-barrel, substantially as and for the purpose set forth.

2. The gun-plug B, made of oil-absorbent material, having the end caps, D D', adapted to engage the ends of the barrel, and the rod C, connecting said plug and caps, substantially as and for the purpose set forth.

3. The sectional gun-plug B, consisting of one or more parts of oil absorbing or containing material, a sectional jointed rod carrying said plug, and end caps adapted to engage the ends of the barrel, said parts being combined substantially as described.

4. A gun-plug of oil absorbing or containing material, end caps adapted to engage the ends of the gun-barrel, washers between caps and plug, and a rod in said plug connecting said caps, said parts being combined substantially as described.

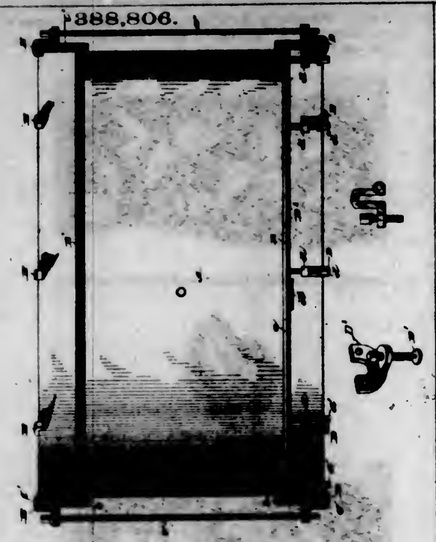
388,805. DEVICE FOR DRESSING THE TEETH OF SAWS. WALLACE C. YEOMANS, Centerport, Pa. Filed Oct. 21, 1887. Serial No. 253,971. (No model.)

Claim.—1. The combination, with a fixed rod or shaft, of a frame adapted to slide on said shaft, a file hold in a recess in said frame, and set-screws screwing in said frame to regulate the angle of the file in relation to the teeth to be filed, substantially as shown and described.

2. The combination, with a fixed shaft and a gage secured to said shaft, of a frame adapted to slide on said shaft, a file held in a recess on said frame, and set-screws screwing in said frame and against the saw-blade, so as to regulate the angle of said file in relation to the teeth to be filed, substantially as shown and described.

3. The combination, with a fixed shaft, a guide-piece held on said shaft, and a set-screw screwing in said guide-piece, of a frame adapted to slide on said shaft and having a groove extending parallel with said shaft, a file held in said groove, and set-screws screwing in said frame and against the saw-blade to regulate the angle of the file in relation to the teeth of the saw, substantially as shown and described.

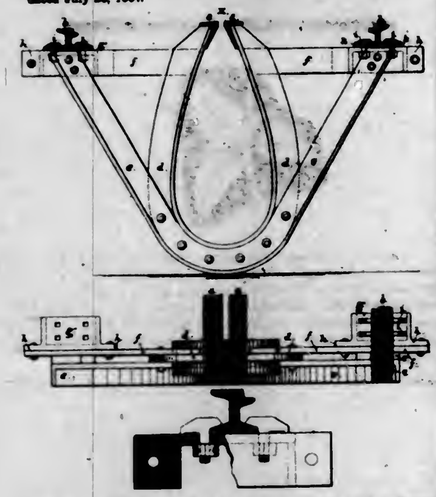
388,806. DRUM. EDWARD ZOELLER, Louisville, Ky. Filed June 21, 1888. Serial No. 277,709. (No model.)



Claim.—1. As a new article of manufacture, a bracket for drums, consisting of a body provided at one end with a tapped lug to overhang the drum-head and receive a set-screw, and at the other end with a lug to engage the head-tightening device, substantially as described.

2. The combination, substantially as described, of a drum the rim at one end of which is provided with brackets having tapped lugs overhanging the heads, set-screws seated in said lugs, and means interposed between the inner ends of the screws and head to protect the latter from abrasion.

3. The combination, substantially as described, of a drum the rim at the snare end of which is provided with brackets having tapped lugs overhanging the head, set-screws seated in said lugs, and a ring seated loosely upon the head beneath the screws and arched at opposite sides to bridge the snares.

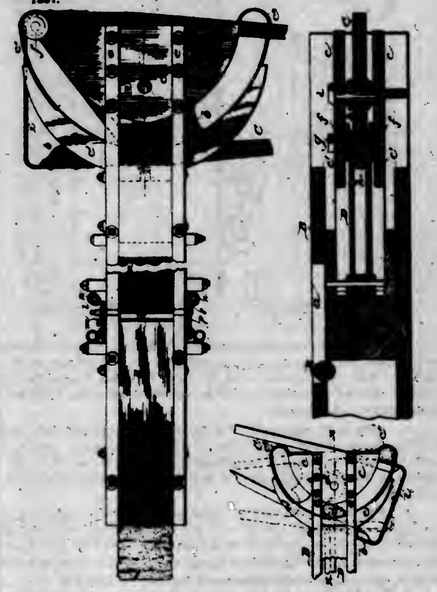


4. The combination, substantially as described, of a drum cylinder or barrel provided at one end with an inwardly-projecting flange on which the snare-head rests, the heads, the rims, the brackets, one set of which is provided with tapped lugs to overhang the snare-head, the tightening means, set-screws fitting the tapped lugs, and means interposed between the lower ends of said screws and the snare-head to protect the latter from abrasion.

388,806.

REISSUES.

10,953. CABLE RAILWAY. GEORGE W. DOUGLAS, San Francisco, Cal. Filed Sept. 7, 1887. Serial No. 248,042. Original No. 367,137, dated July 26, 1887.



Claim.—1. The transverse frame or section for cable railways consisting of a loop formed of T-iron bent into the shape of the tube or tunnel with the horizontal flange inwardly, in combination with the yoke of angle-iron bent to fit the lower curve of the loop, having its vertical flange bolted to the vertical flange of the loop around the curve, and its ends extending upwardly to a point beneath the rails and connected with the upper ends of the loop by transverse tie-bars bolted to both, substantially as herein described.

2. The improved track and slot-iron supporting frame for cable railways, consisting of a loop formed of T-iron and an exterior yoke of angle-iron, the two being bent into the same curve at the lower part and bolted together around the curve, so as to present a base comprising the two horizontal flanges, the upper ends of the yoke and loop diverging, so as to support the track and slot rails, respectively, in combination with the uniting bars or braces, substantially as herein described.

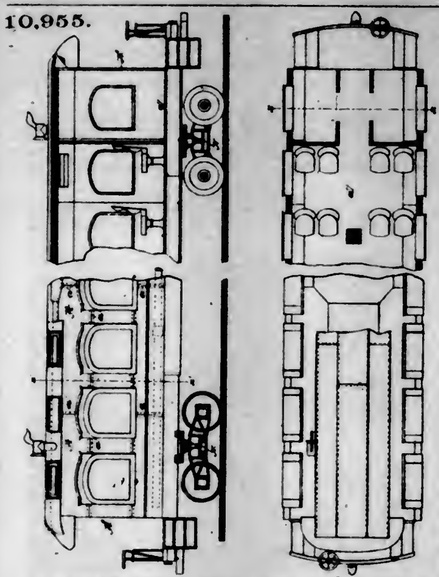
3. The improvement in cable railways, consisting of the transverse slot-irons and track-supporting frames formed of T-iron and angle-iron, as shown, in combination with the rail-supporting chairs bolted to the frames, and having the double-headed bolts constructed to rest upon the flanges of the rail and the top of the chair, substantially as herein described.

4. The herein-described bolt or fastening for holding down a rail to its chair or support, consisting of a body having a threaded shank for a nut, a hook or projecting head for the rail-flange, and an offset or lateral extension opposite to the hook or head, substantially as herein set forth.

10,954. HAY-PRESS. WILLIAM A. LAIRLAW, Cherokee, Kans. Filed July 7, 1888. Serial No. 279,387. Original No. 366,081, dated Mar. 8, 1887.

Claim.—1. In a hay-press of the class hereinbefore described, the combination of the curved bars $c' c'$, arranged as specified, and conical plates c c, whereby a curved slot having an eccentric middle portion is formed between them, the curved straps that connect such parts $c' c'$, the pivoted sweep having the head recessed, the follower, pitman, and bolt, and flanged anti-friction rollers and central roller, all as shown and described.

2. In a hay-press of the class hereinbefore described, the combination, with the follower and the press-box having slatted sides, of the cylindrical roller, lever-arms pivoted to the outer sides of the press-box, the springs, and ratchet and pawl, all constructed and arranged as shown and described.



10,955. RAILWAY-CAR. CHARLES M. SMITH, Boston, Mass., assignor, by mesne assignments, to the Steel Car Company, Denver, Colo. Filed June 25, 1888. Serial No. 278,121. Original No. 366,519, dated July 12, 1887.

Claim.—1. A car-body composed of metal plates riveted together, and having its top, bottom, and sides of different curvatures, combined with keelsons extended longitudinally from end to end of the car-body, and the floor *a*, supported on the said keelsons, and cross-braces for the keelsons, substantially as described.

2. A car-body composed of metal plates riveted together, and having its top, bottom, and sides of different curvature and provided with window-spaces along its sides, combined with metallic dormer-window frames L, bolted or riveted to the metallic body, as set forth, and the cap $L' L^2$ and sliding-sash, the latter, when lifted, entering the space g^4 in the said cap, substantially as described.

3. The metallic car-body composed of metal plates riveted together, and having its top, bottom, and sides of different curvature, and the floor *a*, combined with two or more keelsons at each side of the longitudinal center of the car, the said keelsons being provided with openings for the circulation of air in the spaces below the floor and between it and the body and the keelsons, substantially as described.

10,955.

4. The metallic car-body composed of plates or sheets riveted together, and having its top, bottom, and sides of different curvatures, and the floor *a*, combined with keelsons extended longitudinally through the car-body and beyond the ends to support the platform, substantially as described.

5. A car-body composed of metal plates riveted together, and having its top, bottom, and sides of different curvature, combined with keelsons *c c'*, extended longitudinally from end to end of the car-body, and the floor *a*, supported on said keelsons, substantially as described.

6. A car-body composed of metal plates riveted together, and having its top, bottom, and sides of different curvatures, and flanged braces D, secured to the inside of the car-body, combined with keelsons extended longitudinally from end to end of the car-body, and the floor *a*, supported on said keelsons, substantially as described.

7. The metallic car-body having its top, bottom, and sides of different curvatures, and the braces D, provided with flanges 10, combined with the rods R, connecting the said braces, substantially as described.

8. A car-body composed of sheet metal riveted together to form a shell, the latter in cross-section being in arcs of circles of different radii, the arc comprising the top or roof part of the car-body being smaller than that of the sides of the car-body between the floor-line and window-sills, while the arc for the bottom of the car-body below the floor is of greater radius than the sides below the window-sills, substantially as described.

10,956. PROCESS OF MAKING ELECTROTYPE-DIES. JAMES W. TOWER, Medford, Mass. Filed Mar. 29, 1888. Serial No. 268,966. (Original No. 260,513, dated June 20, 1882.

Claim.—The process of making an intaglio electrotype-die, which consists in producing the desired design in intaglio and in the rough by hand in a metal block or plate, then taking from the mold thus made a soft-metal counterpart, then finishing such counterpart by producing the desired ornamentation thereon by hand, and finally taking an electrotype from said finished counterpart to form the die or mold, substantially as set forth.

NORRIS PETERS

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

OSGOOD *v.* BADGER *v.* BENNETT.

Decided August 15, 1888.

1. CONTROL OF COMMISSIONER OF PATENTS OVER WITNESSES.

The Commissioner of Patents has no control over witnesses. Their production, attendance, and conduct are under the control of the United States courts. If a witness fails to attend or refuses to answer questions without the fault or interference of the adverse party, application should be made to the Federal court for such orders as the circumstances demand. (*Wright v. Daggett*, 44 O. G., 943.)

2. SUPPRESSING DEPOSITIONS.

It should be an extreme case which would justify the Commissioner of Patents in suppressing a deposition on motion of a party who omits to take the proper steps to secure such orders from the courts as would protect him in taking the depositions.

3. BOUND BY HIS ELECTION.

A party who omits to cross-examine, relying upon his motion before the Commissioner to suppress the depositions, elected what course to pursue and is bound thereby. A court of law or equity might relieve him from the consequences of his election and by process compel the witness to appear for cross-examination, or the Commissioner of Patents could order the witness to be produced for cross-examination, under penalty of suppressing his deposition.

4. ORDERS PROCURED BY FRAUD.

Orders procured by fraud which affect the rights of person or property or are injurious to the persons affected should be vacated; but an order recognizing the right of a party to secure and present to the court all his evidence in support of his allegations, which in no sense invades or affects the rights of his adversary, should not be disturbed.

5. EXTENDING TIMES—GOOD FAITH—DILIGENCE.

Courts are uniformly liberal in extending times for the taking of testimony, provided the parties act in good faith and are reasonably diligent; but the degree of diligence required in procuring evidence before trial is not so great as that required to secure a new trial. Especially is this true when the evidence has actually been procured and is in the presence of the court before the trial begins.

6. THE PATENT OFFICE NOT A COURT OF GENERAL JURISDICTION.

Practitioners before the Patent Office are not required to be learned and experienced lawyers, or to possess any special qualifications. Consequently greater indulgence should be shown applicants in matters touching the management and presentation of their cases. While the rules and practice of courts of equity govern here as far as applicable, cases may arise in which they should not be rigidly enforced.

ON motion.

STORE SERVICE APPARATUS.

Application of Edwin P. Osgood filed May 20, 1884, No. 132,204. Application of George A. Badger filed May 12, 1884, No. 131,088. Application of George W. Bennett filed January 10, 1883, No. 81,480.

Messrs. Joyce & Spear for Osgood.

Mr. William Cranch McIntire for Bennett.

Mr. N. W. Stearns, Mr. A. P. Brown, and *Mr. M. S. Hopkins* for Badger.

HALL, *Commissioner:*

Heretofore a motion was made on behalf of Badger (who has assigned his invention and the contest in interference is being conducted and prosecuted by the assignee) to open up the case and permit the taking of certain depositions as evidence-in-chief. It was asserted by the moving party that the evidence sought to be taken was newly-discovered evidence, which, with reasonable diligence, could not have been discovered in time to have been taken under the dates fixed for the taking of testimony. The witnesses whose depositions were desired were William E. Badger, George A. Badger, Mrs. Flora A. Ford, and Walter N. Ford.

The motion was presented, supported by affidavits, and on April 10, 1888, was sustained by the Commissioner as to the witnesses Flora A. Ford and Walter N. Ford and denied as to the others. The parties began the taking of the depositions at Boston on the 25th of April, Flora A. Ford being first produced and sworn. The examination-in-chief was concluded with the forty-ninth interrogatory. The cross-examination appears to have been directed principally to a development of the private life and affairs of the witness and her family, their residence, movements, what clothes were bought, where, and of whom bought, &c. The witness declined to answer a number of questions, for the alleged reason that the matters were private and wholly unconnected with the subject-matter in controversy, and the counsel have put on the record their objections and insistments in the shape of arguments and statements to the examining officer.

On April 25, 1888, a motion was made by counsel for Badger to protect the witness from this course of cross-examination, and the district judge, sitting as circuit judge, ordered that "the cross-examination of the witness as to her past life prior to the year 1875 is not to be further pursued, unless further authorized by the court upon subsequent application," dated April 29, 1888. After this order the witness declined to answer other questions—viz., interrogatories numbered 106, 158, 165, and 167, all relating to her private matters—where she had lived, and if she were married to a Mr. Marsh, &c. To compel her to answer these questions Bennett's counsel made application to the United States circuit court, and on April 30, 1888,

Judge Colt refused the motion and ordered that the witness need not answer the cross-interrogatories, "or any other questions inquiring as to where or the persons with whom she lived after 1880."

After this the cross-examination continued until the 2d of May, when 393 cross-interrogatories had been propounded, many of them of the same character as those considered by the judges, which the witness declined to answer for the same reasons as before, and because she claimed the benefit of the judges' orders. At this point the counsel for Bennett gave notice that he would the next day make a motion before the Commissioner of Patents to vacate the order made April 10, authorizing the taking of these depositions and to strike out the deposition, for the reason that it appeared from the testimony of Flora A. Ford now taken that the alleged testimony was not "newly-discovered," as claimed in the motion on which that order was granted; also, because witness had refused to answer certain questions, &c. The counsel also asked the examining officer to adjourn the further taking of the deposition until the motion could be submitted to the Commissioner and decided. The examining officer declined to adjourn the taking of the deposition. Counsel for Bennett then withdrew and declined to proceed further, and the deposition was signed. The deposition of Walter N. Ford was then taken; but there was no cross-examination. These depositions have been duly certified and are now part of the printed record in the case.

The present motion filed by counsel for Bennett is to vacate the order of April 10, 1888, granting leave to Badger to take the testimony of Flora A. Ford and Walter N. Ford, and that the testimony of those two witnesses be stricken from the record upon the grounds (1) that such order was obtained by misrepresentation and concealment of relevant facts which show that the evidence was not newly-discovered evidence, &c., and (2) on the ground that Flora A. Ford has refused to answer proper and material cross-interrogatories. The latter part of the motion can apply only to the deposition of Flora A. Ford. In his motion Bennett asks that if this motion to vacate the original order and suppress the depositions be denied, then an order be made requiring the witnesses to be produced at an early date for further cross-examination.

I see no reason to suppress the depositions for the reason assigned, viz: that the witness, Flora A. Ford, refused to answer certain cross-interrogatories. The parties conducting the examination were practically in the presence of the United States circuit court. Two orders relating to the examination and the conduct of the witnesses were procured, and others might easily have been obtained; but the orders were favorable to the witness, and, as far as I can see, she appears to have been candid and willing to testify except when the cross-examination trenched upon ground as to which she claimed protection under the judges' orders. As stated in *Wright* v. *Daggett* (44 O. G., 943,) the Commissioner of Patents has no power or control over witnesses. Their production, attendance, and conduct are under the control of the United States courts, and if the witness fails to attend or refuses to answer questions without the fault or interference of the adverse party application should be made to the Federal judge for such orders as the circumstances require. It should be an extreme case that would justify the Commissioner in suppressing a deposition on motion of a party who omits to take the proper steps to secure such orders of the judges as would protect him in taking the depositions. A party by a long and irrelevant cross-examination might harass and vex a witness until he or she would refuse to answer, and then, without applying to the judges, decline to proceed further and move to suppress the deposition for the refusal to answer, which he himself had really occasioned.

In the present case I am satisfied that the witness was willing to answer all relevant and material questions. Orders had been obtained protecting her against irrelevant inquiries and a forced disclosure of private affairs. Afterward she claimed the benefit of that protection as to other interrogatories. Being unlearned and unskilled in legal proceedings, she may have erred and extended her privileges where she ought not. In such case the proper course was again to submit the question to the Federal judge; but this was not done, and in view of witness's apparent candor and the length and character of the cross-examination I see no occasion to interfere and suppress the deposition.

As to the deposition of Walter N. Ford, no attempt was made to cross-examine this witness, although every requisite requiring it had been observed and all parties could have been present. The omission to do so was in consequence of Bennett's conclusion to urge a motion before the Commissioner of Patents to vacate the original order allowing this "newly-discovered evidence" to be taken on behalf of Badger or his assignee. Having determined upon this course, Bennett deemed that it would prejudice the status of this motion before the Commissioner to cross-examine any further; so he omitted it. In doing this he elected what course to pursue and is bound by it. A court of law or equity possessing full powers as to such matters might, on a proper showing, relieve him from the consequences of his election and order a cross-examination and compel the witness by process to appear; but the only power possessed by the Commissioner is to suppress the deposition or to make an order requiring the reproduction of the witness for cross-examination under penalty of the suppression of the deposition. In the present status of the case I am not willing to suppress the deposition, and no showing is made upon which to make the conditional order, if it could be made.

Finally, should the original order allowing these two depositions to be taken "as newly-discovered evidence" be vacated and the depositions thrown out?

There is no doubt about the courts having the power to vacate and set aside orders that have been procured by mistake or fraud; but almost universally such motions to vacate relate to orders affecting the rights of person or property, and are in some manner injurious to the person affected. Thus an order appointing a receiver is one that invades the custody and possession of property in the hands of one of the parties; if procured under a mistake or by fraud it should be vacated. So of many other orders affecting the rights of parties; but the right of one party to secure and present to the court all his evidence in support of his allegations is one which in no sense invades or affects the rights of his adversary. It is as much his right to present all his evidence to the court as it is to have a court that can hear and pass upon it. It is true that rules are established and orders made from time to time for the orderly taking of evidence and limiting the times within which it must be taken; but courts are uniformly very liberal in extending and enlarging these periods provided the parties act in good faith and are reasonably diligent; and it may be safely asserted that the degree of diligence required in procuring evidence before trial is not so great as that required to secure a new trial. Especially is this true when the evidence has actually been procured under an order and is in the presence of the court before the trial begins.

In the present case a motion was made by Badger to be allowed to take these depositions, supported by affidavits showing that it was newly-discovered evidence, relevant and material to the issue. It was argued at great length and most exhaustively. The motion was granted, and in due course the depositions were taken, and they are now before the Office and form part of the record. The case has not been tried, and each party is entitled to have considered all the evidence that can be legally procured and presented when the trial shall be had.

Bennett's motion is in effect a motion to rehear the original motion made by Badger for permission to take this testimony, and it proceeds upon the "newly-discovered evidence" brought out in Mrs. Ford's deposition, from which it is claimed that her evidence was not newly-discovered evidence. Thus Bennett uses and employs Mrs. Ford's deposition, as such, to establish certain facts, in order that he may prevent its use by Badger on the merits. In other words, the present motion is to show that, had this new evidence been before the Commissioner at the hearing of Badger's motion to take such evidence, the decision of the Commissioner would have refused it and not have permitted the depositions to be taken. Now this may be true; but it does not follow that the former order should have been decided differently or that it should now be vacated for such reason. The intervening time and delay cannot be recovered or avoided. The parties cannot be restored in that respect. The depositions have been taken and are here before the Office, and the case has yet to be tried. The party taking them has gone to the trouble and expense of procuring and printing them. I do not believe that such orders are ever reversed or vacated under such circumstances. They rest wholly in the discretion of the courts and are not capable of appeal and review. It is said, however, that the order was procured by fraud, &c.; but I do not find any evidence of fraud in the case. Badger's motion was supported by affidavits. Several were made by persons who were simple people, and their statements were too meager to have been made with any other motive than to state truly what was within their knowledge. Other affidavits were made by attorneys, and there is nothing to show that they were not candid and truthful in all that they stated. In some particulars their statements were not quite specific as to certain dates; but the inaccuracy appears to have been unavoidable. There is nothing in the record that satisfies me there was any purpose anywhere on the part of Badger or the affiants to deceive or mislead the Commissioner. In a clear and gross case of fraud possibly the order obtained ought to be vacated; but even then, if there existed any other mode of punishment, that, perhaps, should be resorted to rather than to exclude from consideration competent and relevant evidence taken under such order and produced before the trial. The force of these considerations will be still further apparent when it is remembered that the Commissioner of Patents is not a court of general jurisdiction. The practice of the Patent Office, though peculiar, does not require practitioners to be learned and experienced lawyers or to possess any special qualifications. Consequently, greater indulgence should be shown to applicants in matters touching the management and presentation of their cases; and while the rules and practice of courts of equity, where practitioners are supposed to be learned and experienced, are, to some extent and as far as applicable, to govern here, yet it must follow that cases may arise where they should not be so rigidly enforced.

Counsel for Bennett has shown great diligence and research in examination of the law and precedents in support of his motion; but not an instance has been found where an order of the court enlarging the time for taking evidence or allowing newly-discovered evidence to be taken before trial has ever been vacated and the evidence stricken out after it had been regularly taken and filed in court pursuant to such order.

The motion is denied, but without prejudice to Bennett's right to take evidence in rebuttal of that of the two Fords last taken.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Northern District of New York.

SHIPMAN ENGINE COMPANY *et al.* *v.* ROCHESTER TOOL WORKS, (LIMITED,) *et al.*

Decided April 14, 1888.

1. SHIPMAN—HYDROCARBON-FURNACE.
   Letters Patent No. 304,365, granted to Albert H. Shipman, September 2, 1884, for hydrocarbon-furnace, adjudged valid and to have been infringed.
2. INVENTION—WHEN IMPARTED BY A COMBINATION.
   Shipman combined in effectual relations an automatic regulator, which was not novel in itself, with the atomizers of earlier patents. This combination presents one test of patentable invention if it produced a new result due simply to the combination.
3. PUBLIC RECOGNITION AN INDICATION OF INVENTION.
   The circumstance that Shipman's apparatus immediately commended itself to the public is persuasive that what he did by way of improvement was not such an obvious thing as to deprive it of the merit of invention.

WALLACE, *J.*:

This suit is brought to restrain infringement of Letters Patent No. 304,365, dated September 2, 1884, granted to Albert H. Shipman, for hydrocarbon-furnace.

The defense of prior public use, based upon the experiments made with the apparatus of Marvin E. Otis,

need not be considered, as the record discloses nothing to modify the opinion expressed at the hearing of the cause that this defense only presents an instance of an experimental use which did not and could not demonstrate a practical realization of the apparatus of the patent. The real question in the case is whether there was any patentable novelty in Shipman's apparatus in view of the prior state of the art. He makes no pretensions to being a pioneer in utilizing liquid fuel as a substitute for coal or other bulkier or more expensive fuels for producing heat or steam. He assumes to have invented certain improvements in hydrocarbon-furnaces, which consist of a combination of devices for regulating more efficiently the rate of combustion by the degree of steam-pressure in the boiler. Although he contemplated the application of his devices more particularly to steam-engines designed for driving light machinery, what he devised and what his patent describes is an improvement in a hydrocarbon-burner for use under a steam-boiler of any kind, effected by a combination of parts, each of which was old and well known when he took up the subject, several of which had previously been used in such burners to perform in combination the functions they perform in his apparatus, but all of which had never before been combined together in the same apparatus.

The patent describes a steam-boiler which may be of any known form; an oil-reservoir which is to contain the liquid fuel and from which the liquid fuel is drawn upward; two pipes, one leading from the reservoir for conducting the oil and the other leading from the boiler for conducting the steam; a steam oil-atomizing jet, which is an atomizer formed by arranging the orifices of the pipes in such relation to each other that the steam will suck up the oil from the reservoir and spray the oil with which it comes in contact, and a steam-regulator which operates automatically by the pressure of steam in the boiler to diminish or entirely cut off the supply of steam in the atomizing-jet.

The regulator is described in the specification as follows:

In order to provide for the regulation of the steam-pressure in the boiler, I combine with the pipe K, which supplies steam to the atomizer, the regulator L'. The regulator consists of a flexible diaphragm, N', Figs. 3 and 4, arranged, in connection with a valve, s'', to operate to reduce the supply of steam to the atomizer when the pressure in the boiler becomes too great. The diaphragm N' forms one side of a chamber, into which the steam is admitted through a pipe, f''', communicating with the boiler or steam-dome through a hollow boss, b'''. The diaphragm is provided at its center with a boss, w'', into which the stem of the valve s'', Fig. 3, is screwed. The head of the valve is fitted to a suitable valve-seat, r''', Fig. 3, and it operates when the diaphragm N' is pressed outward, as represented by the dotted lines in Fig. 3, by the steam in the chamber, to diminish or entirely cut off the supply of steam to the atomizer. The amount of pressure which will be required to accomplish this result may be regulated by screwing the valve s'' in or out of the boss w''. As shown in the drawings, this can only be effected when the pipe K is removed, the intention being to adjust the regulating-valve at the factory before the engine is sent out and to prevent any subsequent alteration of it. The practical effect of the regulator is that, if the pressure in the boiler rises above any given point at which the valve is set, the supply of steam to the atomizer is entirely cut off and the fire goes out. It will be noticed, also, that if the water should be entirely evaporated from the boiler there will be no more steam to supply the atomizer, and the fire in this case also will be extinguished. Provision is thus made for insuring entire safety under any circumstances which may arise.

I have demonstrated by practical trials under various circumstances that the regulator above described is highly efficient and never fails to produce the desired results.

In starting an engine provided with my improved regulator, I obtain a pressure of air in the boiler by means of an air-pump, or by turning the engine backward.

I am aware that the supply of steam and liquid fuel to the furnace of a steam-boiler has been heretofore controlled by a diaphragm-regulator operating to control valves in the supply-pipes; but such construction I do not claim, as in my invention the delivery of the liquid fuel is controlled by varying or cutting off the supply of steam to the atomizing device by a regulator operated by the pressure of the steam in the boiler.

The construction of the regulator herein shown forms no part of the present invention, as it is my intention to file a separate application for Letters Patent on the novel features thereof.

The claims of the patent are as follows:

1. The combination, with a steam-boiler, of an oil-reservoir, a steam oil-atomizing jet, an oil-conduit, and the steam-supply pipe K, and a steam-regulator operating to vary or cut off the supply of steam from the boiler to the atomizer, substantially as and for the purposes set forth.

2. The combination, with a steam-boiler, of an oil-reservoir, the steam oil-atomizing jet i, and oil-conduit h, located above the oil-reservoir, and arranged to draw oil therefrom, and a steam-supply regulator through which the steam passes on its way from the boiler to the atomizer, substantially as and for the purposes set forth.

The prior state of the art is illustrated by United States patents granted to Van Norman, Brown, and Morrison, dated August 1, 1865; to Joseph K. Caldwell, dated September 12, 1871, and March 19, 1872; to Abner Burbank, dated November 5, 1878; to J. L. Kite, dated March 8, 1881; to Park and Heath, dated October 11, 1881, and to E. N. Dickerson, Jr., dated April 18, 1882.

The patent to Van Norman, Brown, and Morrison is cited by the defendant as showing all the devices of Shipman's apparatus in combination. That patent describes a complicated apparatus for commingling oil vaporized in a retort with superheated steam. The apparatus is a hydrocarbon-furnace in which the steam is carried from a boiler through a coil in the fire-box, by which it becomes superheated, and is then delivered to a steam jacket or chamber, which adds heat to a retort already heated by the fire below it. Oil is delivered by means of another coil into the retort, and after being there vaporized the gas escapes through small holes in the retort, mingles with the superheated steam escaping through small holes in the steam-jacket, and they are burned together. It does not contain an atomizer in any sense. It does contain an automatic regulator which operates by pressure in the boiler to shut off the steam in the coil. The apparatus is so remote in principle, as well as in detail of construction and arrangement, from Shipman's apparatus that it could never have suggested any important feature in his. The patent does not contribute any light of value upon the case and only encumbers the record.

The patent to Park and Heath was not deemed of sufficient importance to be commented upon in the argument of counsel at the hearing; but in the brief which has since then been submitted for the defendants it is cited as describing an apparatus which contains an atomizer, a steam-generator and furnace, and an automatic regulating device in combination with these parts. The apparatus contains an injector in which three tubes are located concentrically—one for oil, one for steam, and one for air, all three of which materials are to be burned together. The defendants' expert says:

The steam does not meet the oil in the manner of the Shipman apparatus.

In other words, there is no atomizer. The regulator is described in the specification as one by which—

the amount of fuel and the combustion are steadily maintained without regard to the amount of pressure in the boiler—

and in this respect differs radically in principle from Shipman's regulator.

The patents to Caldwell, Burbank, and Kite do not show any apparatus in which an automatic regulator is employed; but the regulator in the apparatus of each is a common stop-cock, to be manipulated by hand. The hydrocarbon-furnace of each of these patents contains the combination of steam-boiler, oil-reservoir, oil and steam pipes, and atomizer arranged and constructed substantially as described in Shipman's patent, and operating together to perform all the functions of his apparatus, if his did not contain a regulator. In the first Caldwell patent the specification states:

This invention consists of an arrangement of two or more pipes adjustably connected together in such manner that the passage of steam, heated or superheated, through one pipe produces a vacuum in the other pipe, by means of which oils of any gravity are drawn out, driven into a mist or spray, and, combining with the steam, form into hydrocarbon vapor.

The later Caldwell patent describes an oil-pipe leading to an oil-reservoir located on a lower plane, a steam-pipe leading from a boiler, and an arrangement of orifices of the two pipes at a right angle to each other, so as to make an atomizer substantially touch, as is described in his earlier patent. The specification states that he uses these devices in connection with the boiler which supplies steam to an engine, and that the dry steam crossing the orifice of the oil-pipe causes a sufficient vacuum in the latter to induce the hydrocarbon to rise, and the moment it reaches the orifice it is forced into spray by, and is intimately mixed with, the steam. The devices thus combined resemble the devices of the Shipman apparatus so closely that it is unnecessary to refer to the other prior patents which do not contain an automatic regulator.

The patent to E. N. Dickerson, Jr., describes apparatus which approximates much more nearly to Shipman's apparatus than anything shown in the other prior patents. His specification states that the invention—

relates to a method of automatically regulating the combustion or heat produced by a hydrocarbon-burner under boilers or other similar places where pressure is generated; and it consists in combining with the naphtha or naphtha and water supply pipes leading to such burner a valve or valves controlled automatically by the pressure produced by the combustion, and so arranged as to automatically control the supply of liquid fuel without completely cutting off the same.

The apparatus described contains a fire-box under the boiler in which a naphtha burner or retort is located. In this retort water from the steam-boiler and naphtha are burned together. The vaporized oil is conducted through an orifice in the retort by a pipe terminating under the retort, where it escapes and where combustion takes place. Two pipes enter the retort, one connecting with the steam-generator and the other with the naphtha-reservoir, from which the naphtha flows by gravity into the retort.

The regulator is described as follows:

H represents a valve controlling the water-supply, and J a valve controlling the naphtha-supply. K is a connecting-rod moved vertically by the Clark damper L, which may be made adjustable by sliding weight. The steam controlling valves H and J are controlled by adjustable nuts. The upward movement of the rod K may be limited by an adjustable stop, F, for a purpose to be explained.

The specification then describes the operation of the apparatus, as follows:

In the ordinary condition, and before steam has been generated, water and naphtha will be allowed to flow into the burner and be there consumed, thereby heating the boiler and making steam. As soon, however, as the pressure in the boiler is sufficient to counterbalance the weight M, the rod K will begin to rise, thereby shutting off the water and naphtha supply. The extent to which this supply is reduced can be determined by the adjustment of the stop F, because it will be undesirable to shut off the flow altogether, as doing so would necessitate kindling the fire afresh. By having the positions of the valves relatively adjustable the apparatus may be so arranged that the water will be entirely shut off, leaving a limited supply of naphtha, which will burn at the point G (under the retort) and keep the apparatus hot and ready to start fresh when the steam falls in the boiler.

From this description it is obvious that not only is there no atomizer in the Dickerson apparatus, but the mode of operation necessitated by the differences between his apparatus and Shipman's is different from Shipman's. In Shipman's apparatus the oil-supply is controlled solely by the steam-supply, and when the steam-supply is diminished or wholly shut off the oil-supply is thereby likewise diminished or cut off. The regulator is not applied to the oil-pipe; but the flow of oil is controlled by the steam-suction, which is automatically regulated in the steam-pipe. As in Dickerson's apparatus the oil-supply is not obtained by suction, but by gravity, his regulator required to be applied to the oil-pipe as well as the steam-pipe, and it is therefore so devised as to cut off the supply of naphtha by shutting off the naphtha-supply pipe.

Undoubtedly Shipman has only combined in effective relations an automatic regulator that was not novel in itself with the atomizers of earlier patents. One test of invention in such cases is whether a new result has been obtained by the combination of old parts as distinguished from an aggregation of old results. The new combination of Shipman can meet this test, because it is perfectly clear that this combination enables the steam-supply pipe to perform a new function in an atomizer—that is, to exercise a varying suction upon the oil-pipe graduated by the degree of steam-pressure in the boiler. That Shipman's apparatus is exceedingly useful cannot be disputed. Certainly the defendants who have appropriated it completely can hardly dispute the proposition. Everybody recognizes the advantage of having the fuel-supply and the steam-pressure reciprocally regulated, so that when the pressure in the boiler reaches the designated point of safety or convenience the diminished fuel-supply will relieve the pressure, and when it falls below the proper point the increased supply will bring it back to the required power. Dickerson devised one set of contrivances, adapted to his particular form of burner, to accomplish this object. Shipman devised another set, adapted to the particular form of atomizer employed in his furnace, to accomplish it. There was inventive thought in the idea that he could make a valve in the steam-pipe of existing atomizers to do the work of a valve in both the steam-pipe and the oil-pipe of Dickerson's apparatus. Still more was there inventive thought in the idea that he could make any form of existing regulators lend a new function to the steam-pipe of existing atomizers.

It is a significant fact that Shipman's apparatus immediately commended itself to the public for its practical efficiency, and has met with an extensive and increasing patronage both in this country and abroad, while none of the devices described in the prior patents have ever gone into public use. This circumstance, while it suggests that the former devices may not have been practically operative, is persuasive that what Shipman did by way of improving them was not such an obvious thing as to deprive it of the merit of ranking as invention.

A decree is ordered for the complainants.

U. S. Circuit Court—District of New Jersey.

HAT SWEAT MANUFACTURING COMPANY v. PORTER, CROFUT & HODGKINSON.

Decided April 16, 1888.

1. BILL OF COMPLAINT EXHIBITS A CASE FOR EQUITY COGNIZANCE—WHEN.

A bill for a discovery and account, and for a decree for the payment of the royalties and damages sustained, and for an injunction against the use by the defendants in the meantime of any of the inventions recited in the license, exhibits a case for equity cognizance.

2. SAME.

If the sole object of the bill was to enforce the payment of the royalties, the complainant would have an adequate remedy at law; but as discovery is sought as well, and an order to compel the defendants to perform their covenants or abstain from the use of the patents, and as the denial of equitable relief might result in a multiplicity of suits, equity jurisdiction is attained even in the absence of irreparable damage.

MOTION for preliminary injunction.

Mr. John R. Bennett, *Mr. Roscoe Conkling*, and *Mr. A. Q. Keasbey* for complainant.

Mr. Edmund Wetmore for defendants.

WALES, *J.*:

The question presented for consideration is, does the bill exhibit a case for equity cognizance.

The defendants insist that the complainant has an adequate remedy at law. The bill sets forth these facts. The complainant is a Pennsylvania corporation, having its general place of business in Philadelphia. The defendants are citizens of New Jersey. On the 7th of March, 1884, the complainant, being the owner of several patents, all of which relate to sweat-bands for hats or caps, the manufacture thereof, and the machinery used in making them, licensed the defendants to use the patents on certain terms and conditions, among which were the payment of royalties, the rendering of monthly accounts with remittances of cash, and a stipulation that the agents of the complainant should be allowed at all reasonable times to inspect their books for the purpose of verifying their accounts, and to have free access to the premises where the patented machines were operated or stored to verify their number and examine their condition. The defendants also covenanted not to dispute the validity of any of the patents. After accepting the license the defendants made many thousand dozens of hat-bands under the patents, paid the royalties as they fell due, and performed all of their covenants up to June 1, 1887, since which time they have refused to pay royalties, render accounts, or fulfill any part of their agreement with the complainant, although they have continued to use and are still using the patented machines. The complainant has issued 145 licenses, which are all in force and complied with except those of the defendants and four other licensees, against whom similar motions are now pending. The bill further charges that the defendants have combined with certain other licensees of the complainant and with other parties who are infringing these patents, and have formed an association for the contribution of money to embarrass the complainant by expensive litigation and to destroy its license system. The damages claimed for these unlawful acts are estimated at $7,500; and it is also claimed that if the defendants are permitted to continue the violation of their agreement the complainant will receive irreparable injury. The bill prays for a discovery and account, and for a decree for the payment of the royalties and the damage sustained, and enjoining the defendants in the meantime from using any of the inventions recited in the agreement of license.

The defendants do not deny the material allegations of the bill, with the exception of the charge of combination or conspiracy, but excuse their conduct by the statement that they were induced by the false and fraudulent representations of the complainant's agent to execute the agreement of license, and it was therefore void. They also contend that the object of the bill is to enforce the payment of the royalties for which the complainant has an adequate remedy at law. It is admitted that if this were the sole object of the bill it could not be sustained; but the complainant is seeking for something more than a mere naked account. A discovery is sought for as well, and an order to compel the defendants to perform their covenants, or to abstain from the use of the patents, since such use, under all the circumstances of the case, will cause irreparable damage. They assume the right to use the patented machines without compensation, a right acquired under a contract which they now repudiate. By their acts they are endangering the license system of the complainant, and unless promptly restrained will give encouragement to other licensees to imitate their example. Actions at law for the royalties as they fall due would not afford complete relief to the complainant. A new action would be necessary every month, not only against the defendants, but against other licensees who are now acting in like manner by repudiating their contracts with the complainant, and are still using the rights acquired under them. To refuse the injunction would lead to a multiplicity of suits, which may be prevented on a final hearing of this case. The complainant is also entitled to a discovery. These are recognized heads of equity jurisdiction even in the absence of irreparable damage. Injunctions have been granted in this class of cases on a much narrower basis than is here presented. (*Woodward* v. *Weed*, 1 Blatch., 165; *Wilson* v. *Sherman*, Id., 536; *Goodyear* v. *Congress Rubber Co.*, 3 Blatch., 449; *Eureka Co.* v. *Bailey Co.*, 11 Wall., 488; *McKay* v. *Mace*, 23 Fed. R., 76; *Pope Man. Co.* v. *Owsley*, 27 Fed. R., 100; *McKay* v. *Smith*, 29 Fed. R., 295.)

An injunction should therefore be issued unless the defendants within 15 days after notice of the order herein entered shall give bond with two or more sureties, to be approved by a commissioner of the court, conditioned to render monthly accounts according to the terms of their contract with the complainant, and to file such accounts, duly verified, in the office of the clerk of this court, and to pay the amount of any final decree which may be rendered against them, the penalty of the bond to be in such sum as may be agreed on by the parties, or, if they are unable to agree, as may be fixed by the court,
